If a cylinder is leaking combustion pressure into the water jacket, the tester pointer will pulsate with every combustion stroke of the cylinder.

CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
 - Leaks between adjacent cylinders or into water jacket.
 - Any causes for combustion/compression pressure loss.
- (1) Check the coolant level and fill as required. DO NOT install the radiator cap.
 - (2) Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.
 - (3) Remove the spark plugs.
 - (4) Remove the oil filler cap.
 - (5) Remove the air cleaner.

(6) Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

(7) Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to the Cylinder Combustion Pressure Leakage Test Diagnosis chart.

DIAGNOSIS AND TESTING (Continued)

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat inspection.

(4) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method.

Air Leak Detection Test Method

(1) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(2) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(3) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(4) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(5) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil

DIAGNOSIS AND TESTING (Continued)

filter runoff, and main bearing cap to cylinder block mating surfaces.

(4) If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

ENGINE OIL PRESSURE

(1) Disconnect connector and remove oil pressure sending unit.

(2) Install Oil Pressure Line and Gauge Tool C-3292 or equivalent. Start engine and record pressure. Refer to Oil Pressure in Engine Specifications for the correct pressures.

SERVICE PROCEDURES

VALVE TIMING

- Disconnect the spark plug wires and remove the spark plugs.
- Remove the engine cylinder head cover.
- Remove the capscrews, bridge and pivot assembly, and rocker arms from above the No.1 cylinder.
- Alternately loosen each capscrew, one turn at a time, to avoid damaging the bridge.
- Rotate the crankshaft until the No.4 piston is at top dead center (TDC) on the compression stroke.
- Rotate the crankshaft counterclockwise (viewed from the front of the engine) 90°.
- Install a dial indicator on the end of the No.1 cylinder intake valve push rod. Use rubber tubing to secure the indicator stem on the push rod.
- Set the dial indicator pointer at zero.
- Set the dial indicator pointer at zero.
- Rotate the crankshaft clockwise (viewed from the front of the engine) until the dial indicator

pointer indicates 0.305 mm (0.012 inch) travel distance (lift).

- The timing notch index on the vibration damper should be aligned with the TDC mark on the timing degree scale.
- If the timing notch is more than 13 mm (1/2 inch) away from the TDC mark in either direction, the valve timing is incorrect.
- If the valve timing is incorrect, the cause may be a broken camshaft pin. It is not necessary to replace the camshaft because of pin failure. A spring pin is available for service replacement.

VALVE, GUIDE AND SEAL

Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

Clean all grime and gasket material from the engine cylinder head machined gasket surface.

Inspect for cracks in the combustion chambers and valve ports.

Inspect for cracks on the exhaust seat.

Inspect for cracks in the gasket surface at each coolant passage.

Inspect valves for burned, cracked or warped heads.

Inspect for scuffed or bent valve stems.

Replace valves displaying any damage.

VALVE REFACING

(1) Use a valve refacing machine to reface the intake and exhaust valves to the specified angle.

(2) After refacing, a margin of at least 0.787 mm (0.031 inch) must remain (Fig. 13). If the margin is less than 0.787 mm (0.031 inch), the valve must be replaced.

VALVE SEAT REFACING

(1) Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.

(2) Use tapered stones to obtain the specified seat width when required.

(3) Control valve seat runout to a maximum of 0.0635 mm (0.0025 in.)— (Fig. 14).

VALVE STEM OIL SEAL REPLACEMENT

Valve stem oil seals are installed on each valve stem to prevent rocker arm lubricating oil from entering the combustion chamber through the valve guide bores. One seal is marked INT (intake valve) and the other is marked EXH (exhaust valve).

Replace the oil seals whenever valve service is performed or if the seals have deteriorated.

VALVE GUIDES

The valve guides are an integral part of the engine cylinder head and are not replaceable.

When the valve stem guide clearance is excessive, the valve guide bores must be reamed oversize. Service valves with oversize stems are available in 0.076 mm (0.003 inch) and 0.381 mm (0.015 inch) increments.

Corresponding oversize valve stem seals are also available and must be used with valves having 0.381 mm (0.015 inch) oversize stems. 0.076mm (.003in.) oversize stems do not require oversize seals.

NOTE: If the valve guides are reamed oversize, the valve seats must be ground to ensure that the valve seat is concentric to the valve guide.

VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT

Valve stem-to-guide clearance may be measured by either of the following two methods.

PREFERRED METHOD:

- (1) Remove the valve from the head.
- (2) Clean the valve stem guide bore with solvent and a bristle brush.
- (3) Insert a telescoping gauge into the valve stem guide bore approximately 9.525 mm (.375 inch) from the valve spring side of the head (Fig. 15).

J9509-87

Fig. 15 Measurement of Valve Guide Bore Diameter

- 1 - GAUGE
2 - 9.525 MM (3/8 INCH)
3 - VALVE STEM GUIDE
4 - CYLINDER HEAD

- (4) Remove and measure telescoping gauge with a micrometer.

- (5) Repeat the measurement with contacts lengthwise to engine cylinder head.

- (6) Compare the crosswise to lengthwise measurements to determine out-of-roundness. If the measurements differ by more than 0.0635 mm (0.0025 in.), ream the guide bore to accommodate an oversize valve stem.

- (7) Compare the measured valve guide bore diameter with specifications (7.95-7.97 mm or 0.313-0.314

SERVICE PROCEDURES (Continued)

inch). If the measurement differs from specification by more than 0.076 mm (0.003 inch), ream the guide bore to accommodate an oversize valve stem.

ALTERNATIVE METHOD:

(1) Use a dial indicator to measure the lateral movement of the valve stem (stem-to-guide clearance). This must be done with the valve installed in its guide and just off the valve seat (Fig. 16).

(2) Correct clearance is 0.025-0.0762 mm (0.001-0.003 inch). If indicated movement exceeds the specification ream the valve guide to accommodate an oversize valve stem.

NOTE: Valve seats must be ground after reaming the valve guides to ensure that the valve seat is concentric to the valve guide.

Fig. 16 Measurement of Lateral Movement Of Valve Stem

1 - DIAL INDICATOR

VALVE SPRING TENSION TEST

Use a Universal Valve Spring Tester and a torque wrench to test each valve spring for the specified tension value (Fig. 17).

Replace valve springs that are not within specifications.

PISTON—FITTING

BORE GAUGE METHOD

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

9509-79

Fig. 17 Valve Spring Tester

1 - TORQUE WRENCH
2 - VALVE SPRING TESTER

(2) Measure the inside diameter of the cylinder bore at a point 49.5 mm (1-15/16 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B (Fig. 19).

(3) The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. **The coated piston connecting rod assembly can be used to service previous built engines and MUST be replaced as complete sets.** Tin coated pistons should not be used as replacements for coated pistons.

(4) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results (Fig. 18). Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.

(5) Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

98.458 - 98.468 mm (3.8763 - 3.8767 in.)	C
98.468 - 98.478 mm (3.8767 - 3.8771 in.)	D
98.478 - 98.488 mm (3.8771 - 3.8775 in.)	E
98.488 - 98.498 mm (3.8775 - 3.8779 in.)	F

PISTON RING—FITTING

- (1) Carefully clean the carbon from all ring grooves. Oil drain openings in the oil ring groove and pin boss must be clear. DO NOT remove metal from the grooves or lands. This will change ring-to-groove clearances and will damage the ring-to-land seating.
- (2) Be sure the piston ring grooves are free of nicks and burrs.
- (3) Measure the ring side clearance with a feeler gauge fitted snugly between the ring land and ring (Fig. 20) (Fig. 21). Rotate the ring in the groove. It must move freely around circumference of the groove.

GROOVE HEIGHT

- A 1.530-1.555 mm (0.0602-0.0612 in)
- B 4.035-4.060 mm (0.1589-0.1598 in)

Fig. 20 Piston Dimensions

SERVICE PROCEDURES (Continued)

**Fig. 21 Ring Side Clearance Measurement**

1 - FEELER GAUGE

RING SIDE CLEARANCE CHART

ITEM	SPECIFICATION
Top Compression Ring	0.042 - 0.084 mm (0.0017 - 0.0033 in.)
Second Compression Ring	0.042 - 0.084 mm (0.0017 - 0.0033 in.)
Oil Control Ring	0.06 - 0.21 mm (0.0024 - 0.0083 in.)

(4) Place ring in the cylinder bore and push down with inverted piston to position near lower end of the ring travel. Measure ring gap with a feeler gauge fitting snugly between ring ends (Fig. 22).

(5) The oil control rings are symmetrical, and can be installed with either side up. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

(6) The two compression rings are different and cannot be interchanged. The top compression ring can be identified by the shiny coating on the outer sealing surface and can be installed with either side up. (Fig. 23).

(7) The second compression ring has a slight chamfer on the bottom of the inside edge and a dot on the top for correct installation (Fig. 24).

**Fig. 22 Gap Measurement**

SERVICE PROCEDURES (Continued)

CONNECTING ROD BEARINGS—FITTING

Inspect the connecting rod bearings for scoring and bent alignment tabs (Fig. 28) (Fig. 29). Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting (Fig. 30). Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs.

Fig. 28 Connecting Rod Bearing Inspection

- 1 - UPPER BEARING HALF
- 2 - MATING EDGES
- 3 - GROOVES CAUSED BY ROD BOLTS SCRATCHING JOURNAL DURING INSTALLATION
- 4 - WEAR PATTERN - ALWAYS GREATER ON UPPER BEARING
- 5 - LOWER BEARING HALF

Fig. 29 Locking Tab Inspection

- 1 - ABNORMAL CONTACT AREA CAUSED BY LOCKING TABS NOT FULLY SEATED OR BEING BENT

Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft con-

Fig. 30 Scoring Caused by Insufficient Lubrication or by Damaged Crankshaft Pin Journal

necting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment. Replace misaligned, bent or twisted connecting rods.

- (1) Wipe the oil from the connecting rod journal.
- (2) Use short rubber hose sections over rod bolts during installation.
- (3) Lubricate the upper bearing insert and install in connecting rod.
- (4) Use piston ring compressor to install the rod and piston assemblies. The oil squirt holes in the rods must face the camshaft. The arrow on the piston crown should point to the front of the engine (Fig. 31). Verify that the oil squirt holes in the rods face the camshaft and that the arrows on the pistons face the front of the engine.

Fig. 31 Rod and Piston Assembly Installation

- (5) Install the lower bearing insert in the bearing cap. The lower insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. Plastigage must not crumble in use. If brittle, obtain fresh stock.

- (6) Install bearing cap and connecting rod on the journal and tighten nuts to 45 N·m (33 ft. lbs.) torque. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.

- (7) Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (Fig. 32). Refer to

SERVICE PROCEDURES (Continued)

Engine Specifications for the proper clearance. **Plastigage should indicate the same clearance across the entire width of the insert. If the clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**

(8) If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

(9) If bearing-to-journal clearance exceeds the specification, install a pair of 0.0254 mm (0.001 inch) undersize bearing inserts. All the odd size inserts must be on the bottom. The sizes of the service replacement bearing inserts are stamped on the backs of the inserts. Measure the clearance as described in the previous steps.

(10) The clearance is measured with a pair of 0.0254 mm (0.001 inch) undersize bearing inserts installed. This will determine if two 0.0254 mm (0.001 inch) undersize inserts or another combination is needed to provide the correct clearance (refer to Connecting Rod Bearing Fitting Chart).

J9009-42

Fig. 32 Measuring Bearing Clearance with Plastigage

2 - COMPRESSED PLASTIGAGE

CONNECTING ROD BEARING FITTING CHART

CRANKSHAFT JOURNAL		CORRESPONDING CONNECTING ROD BEARING INSERT	
Color Code	Diameter	Upper Insert Size	Lower Insert Size
Yellow	53.2257-53.2079 mm (2.0955-2.0948 in.)	Yellow - Standard	Yellow - Standard
Orange	53.2079 - 53.1901 mm (2.0948 - 2.0941 in.) 0.0178 mm (0.0007 in.) Undersize	Yellow - Standard	Blue - Undersize 0.025 mm (0.001 in.)
Blue	53.1901 - 53.1724 mm (2.0941 - 2.0934 in.) 0.0356 mm (0.0014 in.) Undersize	Blue - Undersize 0.025 mm (0.001 in.)	Blue - Undersize 0.025 mm (0.001 in.)
Red	52.9717 - 52.9539 mm (2.0855 - 2.0848 in.) 0.254 mm (0.010 in.) Undersize	Red - Undersize 0.254 mm (0.010 in.)	Red - Undersize 0.254 mm (0.010 in.)

SERVICE PROCEDURES (Continued)

(11) **FOR EXAMPLE:** If the initial clearance was 0.0762 mm (0.003 inch), 0.025 mm (0.001 inch) undersize inserts would reduce the clearance by 0.025 mm (0.001 inch). The clearance would be 0.002 inch and within specification. A 0.051 mm (0.002 inch) undersize insert would reduce the initial clearance an additional 0.013 mm (0.0005 inch). The clearance would then be 0.038 mm (0.0015 inch).

(12) Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

(13) Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 45 N·m (33 ft. lbs.) torque.

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange (Fig. 33). Refer to Engine Specifications for the proper clearance. Replace the connecting rod if the side clearance is not within specification.

Fig. 33 Checking Connecting Rod Side Clearance—Typical

FITTING CRANKSHAFT MAIN BEARINGS

INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated (Fig. 34). In general the lower bearing half will have a heavier wear pattern.

NOTE: If any of the crankshaft journals are scored, remove the engine for crankshaft repair.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage. Replace all damaged or worn bearing inserts.

FITTING BEARINGS (CRANKSHAFT INSTALLED)

The main bearing caps, numbered (front to rear) from 1 through 5 have an arrow to indicate the for-

Fig. 34 Main Bearing Wear Patterns

- 1 - UPPER INSERT
- 2 - NO WEAR IN THIS AREA
- 3 - LOW AREA IN BEARING LINING
- 4 - LOWER INSERT

ward position. The upper main bearing inserts are grooved to provide oil channels while the lower inserts are smooth.

Each bearing insert pair is selectively fitted to its respective journal to obtain the specified operating clearance. In production, the select fit is obtained by using various-sized color-coded bearing insert pairs as listed in the Main Bearing Fitting Chart. The bearing color code appears on the edge of the insert. **The size is not stamped on bearing inserts used for engine production.**

The main bearing journal size (diameter) is identified by a color-coded paint mark on the adjacent cheek. The rear main journal, is identified by a color-coded paint mark on the crankshaft rear flange.

When required, upper and lower bearing inserts of different sizes may be used as a pair. A standard size insert is sometimes used in combination with a 0.025 mm (0.001 inch) undersize insert to reduce the clearance by 0.013 mm (0.0005 inch). **Never use a pair of bearing inserts with greater than a 0.025 mm (0.001 inch) difference in size. Refer to the Bearing Insert Pair Chart.**

BEARING INSERT PAIR CHART

INSERT	CORRECT	INCORRECT
UPPER	STANDARD	STANDARD
LOWER	0.025 mm (0.001 in.) UNDERSIZE	0.051 mm (0.002 in.) UNDERSIZE

SERVICE PROCEDURES (Continued)

NOTE: When replacing inserts, the odd size inserts must be either all on the top (in cylinder block) or all on the bottom (in main bearing cap).

Once the bearings have been properly fitted, proceed to Crankshaft Main Bearing—Installation.

BEARING-TO-JOURNAL CLEARANCE (CRANKSHAFT INSTALLED)

When using Plastigage, check only one bearing clearance at a time.

Install the grooved main bearings into the cylinder block and the non-grooved bearings into the bearing caps.

Install the crankshaft into the upper bearings dry.

Place a strip of Plastigage across full width of the crankshaft journal to be checked.

Install the bearing cap and tighten the bolts to 108 N·m (80 ft. lbs.) torque.

NOTE: DO NOT rotate the crankshaft. This will cause the Plastigage to shift, resulting in an inaccurate reading. Plastigage must not be permitted to crumble. If brittle, obtain fresh stock.

Remove the bearing cap. Determine the amount of clearance by measuring the width of the compressed Plastigage with the scale on the Plastigage envelope (Fig. 35). Refer to Engine Specifications for the proper clearance.

Fig. 35 Measuring Bearing Clearance with Plastigage

- 1 - PLASTIGAGE SCALE
- 2 - COMPRESSED PLASTIGAGE

Plastigage should indicate the same clearance across the entire width of the insert. If clearance varies, it may indicate a tapered journal or foreign material trapped behind the insert.

If the specified clearance is indicated and there are no abnormal wear patterns, replacement of the bear-

ing inserts is not necessary. Remove the Plastigage from the crankshaft journal and bearing insert. Proceed to Crankshaft Main Bearing—Installation.

If the clearance exceeds specification, install a pair of 0.025 mm (0.001 inch) undersize bearing inserts and measure the clearance as described in the previous steps.

The clearance indicated with the 0.025 mm (0.001 inch) undersize insert pair installed will determine if this insert size or some other combination will provide the specified clearance. **FOR EXAMPLE:** If the clearance was 0.0762 mm (0.003 inch) originally, a pair of 0.0254 mm (0.001 inch) undersize inserts would reduce the clearance by 0.0254 mm (0.001 inch). The clearance would then be 0.0508 mm (0.002 inch) and within the specification. A 0.051 mm (0.002 inch) undersize bearing insert and a 0.0254 mm (0.001 inch) undersize insert would reduce the original clearance an additional 0.0127 mm (0.0005 inch). The clearance would then be 0.0381 mm (0.0015 inch).

CAUTION: Never use a pair of inserts that differ more than one bearing size as a pair.

FOR EXAMPLE: DO NOT use a standard size upper insert and a 0.051 mm (0.002 inch) undersize lower insert.

If the clearance exceeds specification using a pair of 0.051 mm (0.002 inch) undersize bearing inserts, measure crankshaft journal diameter with a micrometer. If the journal diameter is correct, the crankshaft bore in the cylinder block may be misaligned, which requires cylinder block replacement or machining to true bore.

If journals 1 through 5 diameters are less than 63.4517 mm (2.4981 inches), replace crankshaft or grind crankshaft down to accept the appropriate undersize bearing inserts.

Once the proper clearances have been obtained, proceed to Crankshaft Main Bearing—Installation.

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Remove the crankshaft from the cylinder block (refer to Cylinder Block - Disassembly).

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper and out of round is 0.013 mm (0.0005 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

Once the proper clearances have been obtained, proceed to Crankshaft Main Bearing—Installation.

SERVICE PROCEDURES (Continued)

MAIN BEARING FITTING CHART

CRANKSHAFT JOURNALS		CORRESPONDING CRANKSHAFT BEARING INSERT	
Color Code	Diameter	Upper Insert Size	Lower Insert Size
Yellow	63.5025 - 63.4898 mm (2.5001 - 2.4996 in.)	Yellow - Standard	Yellow - Standard
Orange	63.4898 - 63.4771 mm (2.4996 - 2.4991 in.) 0.0127 mm (0.0005 in.) Undersize	Yellow - Standard	Blue- Undersize 0.025 mm (0.001 in.)
Blue	63.4771 - 63.4644 mm (2.4991 - 2.4986 in.) 0.0254 mm (0.001 in.) Undersize	Blue- Undersize 0.025 mm (0.001 in.)	Blue- Undersize 0.025 mm (0.001 in.)
Green	63.4644 - 63.4517 mm (2.4986 - 2.4981 in.) 0.0381 mm (0.0015 in.) Undersize	Blue - Undersize 0.025 mm (0.001 in.)	Green - Undersize 0.051 mm (0.002 in.)
Red	63.2485 - 63.2358 mm (2.4901 - 2.4896 in.) 0.254 mm (0.010 in.) Undersize	Red - Undersize 0.254 mm (0.010 in.)	Red - Undersize 0.254 mm (0.010 in.)

FORM-IN-PLACE GASKETS

There are several places where form-in-place gaskets are used on the engine. **DO NOT use form-in-place gasket material unless specified.** Care must be taken when applying form-in-place gaskets. Bead size, continuity and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over. A continuous bead of the proper width is essential to obtain a leak-free joint.

Two types of form-in-place gasket materials are used in the engine area (Mopar Silicone Rubber Adhesive Sealant and Mopar Gasket Maker). Each have different properties and cannot be used interchangeably.

MOPAR SILICONE RUBBER ADHESIVE SEALANT

Mopar Silicone Rubber Adhesive Sealant, normally black in color, is available in 3 ounce tubes. Moisture in the air causes the sealant material to cure. This material is normally used on flexible metal flanges. It has a shelf life of a year and will not properly cure if over aged. Always inspect the package for the expiration date before use.

MOPAR GASKET MAKER

Mopar Gasket Maker, normally red in color, is available in 6 cc tubes. This anaerobic type gasket material cures in the absence of air when squeezed between smooth machined metallic surfaces. It will not cure if left in the uncovered tube. DO NOT use on flexible metal flanges.

SURFACE PREPARATION

Parts assembled with form-in-place gaskets may be disassembled without unusual effort. In some instances, it may be necessary to lightly tap the part with a mallet or other suitable tool to break the seal between the mating surfaces. A flat gasket scraper may also be lightly tapped into the joint but care must be taken not to damage the mating surfaces.

Scrape or wire brush all gasket surfaces to remove all loose material. Inspect stamped parts to ensure gasket rails are flat. Flatten rails with a hammer on a flat plate, if required. Gasket surfaces must be free of oil and dirt. Make sure the old gasket material is removed from blind attaching holes.

GASKET APPLICATION

Assembling parts using a form-in-place gasket requires care.

SERVICE PROCEDURES (Continued)

Mopar Silicone Rubber Adhesive Sealant should be applied in a continuous bead approximately 3 mm (0.12 inch) in diameter. All mounting holes must be circled. For corner sealing, a 3 or 6 mm (1/8 or 1/4 inch) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The use of a locating dowel is recommended during assembly to prevent smearing the material off location.

Mopar Gasket Maker should be applied sparingly to one gasket surface. The sealant diameter should be 1.00 mm (0.04 inch) or less. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing the material off location.

ENGINE PERFORMANCE

It is important that the vehicle is operating to its optimum performance level to maintain fuel economy and the lowest emission levels. If vehicle is not operating to these standards, refer to Engine Diagnosis outlined in this section. The following procedures can assist in achieving the proper engine diagnosis.

(1) Test cranking amperage draw. Refer to Electrical Group 8B, Cold Cranking Test.

(2) Check intake manifold bolt torque; Refer to Group 11, Exhaust System and Intake Manifold.

(3) Perform cylinder compression test. Refer to Cylinder Compression Pressure Test in the Engine Diagnosis area of this section.

(4) Clean or replace spark plugs as necessary and adjust gap as specified in Electrical Group 8D. Tighten to specifications.

(5) Test resistance of spark plug cables. Refer to Electrical Group 8D, Spark Plug Cables.

(6) Inspect the primary wires. Test coil output voltage and primary resistance. Replace parts as necessary. Refer to Electrical Group 8D, for specifications.

(7) Test fuel pump for pressure. Refer to Group 14, Fuel System Specifications.

(8) The air filter elements should be replaced as specified in Lubrication and Maintenance, Group 0.

(9) Inspect crankcase ventilation system as outlined in Group 0, Lubrication and Maintenance. For emission controls see Group 25, Emission Controls for service procedures.

(10) Road test vehicle as a final test.

HONING CYLINDER BORES

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep

abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823 equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880 or a light honing oil available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 36).

J9209-12

Fig. 36 Cylinder Bore Crosshatch Pattern

- 1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush

SERVICE PROCEDURES (Continued)

to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

SERVICE ENGINE ASSEMBLY (SHORT BLOCK)

A service replacement engine assembly (short block) may be installed whenever the original cylinder block is defective or damaged beyond repair. It consists of the cylinder block, crankshaft, piston and rod assemblies. If needed, the camshaft must be procured separately and installed before the engine is installed in the vehicle.

A short block is identified with the letter "S" stamped on the same machined surface where the build date code is stamped for complete engine assemblies.

Installation includes the transfer of components from the defective or damaged original engine. Follow the appropriate procedures for cleaning, inspection and torque tightening.

HYDROSTATIC LOCK

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

- (1) Perform the Fuel Pressure Release Procedure (refer to Group 14, Fuel System).
- (2) Disconnect the negative cable from the battery.
- (3) Inspect air cleaner, induction system and intake manifold to ensure system is dry and clear of foreign material.
- (4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the plugs from the engine.

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

- (5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.
- (6) Identify the fluid in the cylinders (i.e. coolant, fuel, oil, etc.).

(7) Make sure all fluid has been removed from the cylinders.

(8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 37 N·m (27 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil (refer to Group 0, Lubrication and Maintenance).

(15) Connect the negative cable to the battery.

(16) Start the engine and check for any leaks.

ENGINE OIL SERVICE

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY.

ENGINE OIL SPECIFICATION

CAUTION: Do not use non-detergent or straight mineral oil when adding or changing crankcase lubricant. Engine failure can result.

API SERVICE GRADE CERTIFIED

In gasoline engines, use an engine oil that is API Service Grade Certified (Fig. 37).

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 37).

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. SAE 10W-30 specifies a multiple viscosity engine oil.

When choosing an engine oil, consider the range of temperatures the vehicle will be operated in before the next oil change. Select an engine oil that is best

SERVICE PROCEDURES (Continued)

9400-9

Fig. 37 Engine Oil Container Standard Notations

suited to your area's particular ambient temperature range and variation (Fig. 38).

**Fig. 38 Temperature/Engine Oil Viscosity****ENERGY CONSERVING OIL**

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

The engine oil level indicator (Dipstick) is located at the right rear of the 2.5L engine. Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick (Fig. 39).

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.
- (4) Install dipstick and verify it is seated in the tube.

(5) Remove dipstick, with handle held above the tip, note oil level reading (Fig. 39).

(6) Add oil only if level is below the ADD mark on dipstick.

**Fig. 39 Engine Oil Dipstick—2.5L Engine**

- 1 - DIPSTICK
- 2 - SAFE
- 3 - ADD

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

(1) Position the vehicle on a level surface and turn engine off.

(2) Hoist and support vehicle on safety stands.

(3) Remove oil fill cap.

(4) Place a suitable drain pan under crankcase drain.

(5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.

(6) Install drain plug in crankcase.

(7) Lower vehicle and fill crankcase with specified type and amount of engine oil described in this section.

(8) Install oil fill cap.

(9) Start engine and inspect for leaks.

(10) Stop engine and inspect oil level.

SERVICE PROCEDURES (Continued)

ENGINE OIL FILTER CHANGE

FILTER SPECIFICATION

CAUTION: Do not use oil filter with metric threads. The proper oil filter has SAE type 3/4 X 16 threads. An oil filter with metric threads can result in oil leaks and engine failure.

All Jeep engines are equipped with a high quality full-flow, throw-away type oil filter. Chrysler Corporation recommends a Mopar or equivalent oil filter be used.

OIL FILTER REMOVAL

- (1) Position a drain pan under the oil filter.
- (2) Using a suitable oil filter wrench loosen filter.
- (3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss (Fig. 40).

Fig. 40 Oil Filter—2.5L Engine

1 - OIL FILTER

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) With a wiping cloth, clean the gasket sealing surface (Fig. 41) of oil and grime.

OIL FILTER INSTALLATION

(1) Lightly lubricate oil filter gasket with engine oil or chassis grease.

(2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 41) hand tighten filter one full turn, do not over tighten.

(3) Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

Fig. 41 Oil Filter Sealing Surface—Typical

- 1 - SEALING SURFACE
- 2 - RUBBER GASKET
- 3 - OIL FILTER

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this section.

REMOVAL AND INSTALLATION

ENGINE MOUNTS—FRONT

The front mounts support the engine at each side. These supports are made of resilient rubber.

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Raise the vehicle.
- (3) Support the engine.
- (4) Remove through bolt nut (Fig. 42). DO NOT remove the through bolt.
- (5) Remove the retaining bolts and nuts from the support cushions (Fig. 42).
- (6) Remove the through bolt.
- (7) Remove the support cushions.

INSTALLATION

(1) If the engine support bracket was removed, position the LEFT bracket (Fig. 42) and the RIGHT bracket (Fig. 43) onto the cylinder block. Install the bolts and stud nuts.

(a) RIGHT SIDE (Fig. 43) —Tighten the bolts to 61 N·m (45 ft. lbs.) torque. Tighten the stud nuts to 46 N·m (34 ft. lbs.) torque.

(b) LEFT SIDE (Fig. 42) —Tighten the bolts to 61 N·m (45 ft. lbs.) torque.

(2) If the support cushion brackets were removed, position the brackets onto the lower front sill (Fig. 42) (Fig. 44). Install the bolts and stud nuts. Tighten the bolts to 54 N·m (40 ft. lbs.) torque and the stud nuts to 41 N·m (30 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

**Fig. 42 Front Mounts**

- 5 - ATTACHING BOLT
- 6 - SUPPORT CUSHION
- 7 - THROUGH BOLT
- 8 - ENGINE SUPPORT BRACKET
- 9 - SUPPORT CUSHION BRACKET
- 10 - SILL

(3) Place the support cushions onto the support cushion brackets (Fig. 42). Tighten the right support cushion nuts to 65 N·m (48 ft. lbs.) torque. Tighten the left support cushion bolt and nut to 41 N·m (30 ft. lbs.) torque.

(4) Install the through bolt and the retaining nut (Fig. 42). Tighten the through bolt nut to 65 N·m (48 ft. lbs.) torque.

(5) Remove the engine support.

(6) Lower the vehicle.

(7) Connect negative cable to battery.

ENGINE MOUNT—REAR

A resilient rubber cushion supports the transmission at the rear between the transmission extension housing and the rear support crossmember or skid plate.

**Fig. 43 Engine Support Bracket—Right Side**

- 1 - ENGINE SUPPORT BRACKET

**Fig. 44 Support Cushion Bracket—Left Side**

- 1 - LOWER FRONT SILL
- 2 - TRACK BAR MOUNTING PLATE
- 3 - SUPPORT CUSHION BRACKET

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Raise the vehicle and support the transmission.
- (3) Remove the nuts holding the support cushion to the crossmember (Fig. 45) (Fig. 46). Remove the crossmember.

MANUAL TRANSMISSION:

- a. Remove the support cushion nuts and remove the cushion.
- b. If necessary, remove the bolts holding the transmission support bracket to the transmission (Fig. 45). Remove the bracket.

REMOVAL AND INSTALLATION (Continued)

J9409-44

Fig. 45 Rear Mount (Manual Transmission)

- 1 - TRANSMISSION SUPPORT BRACKET
2 - SUPPORT CUSHION

AUTOMATIC TRANSMISSION:

- a. Remove the support cushion bolts and remove the cushion and the transmission support bracket.
- b. If necessary on 2WD vehicles, remove the bolts holding the transmission support adaptor bracket to the transmission (Fig. 46). Remove the adaptor bracket.

INSTALLATION**MANUAL TRANSMISSION:**

- a. If removed, position the transmission support bracket to the transmission and install the bolts. Tighten the bolts to 43 N·m (32 ft. lbs.) torque.
- b. Position the support cushion onto the transmission support bracket. Install and tighten the nuts to 46 N·m (34 ft. lbs.) torque.

AUTOMATIC TRANSMISSION:

- a. If removed, position the transmission support adaptor bracket (2WD vehicles) to the transmission and install the bolts. Tighten the bolts to 75 N·m (55 ft. lbs.) torque.
- b. Position the transmission support bracket and support cushion to the transmission and install the bolts. Tighten the bolts to 75 N·m (55 ft. lbs.) torque.
- (1) Position the crossmember onto the support cushion studs and install the nuts. Tighten the nuts to 22 N·m (192 in. lbs.) torque.
- (2) Install the crossmember to sill bolts and tighten to 41 N·m (30 ft. lbs.) torque.
- (3) Remove the transmission support.
- (4) Lower the vehicle.
- (5) Connect negative cable to battery.

J9409-45

6 - TRANSMISSION SUPPORT BRACKET

ENGINE**REMOVAL**

- (1) Disconnect the battery cables. Remove the battery.
- (2) Mark the hinge locations on the hood panel for alignment reference during installation. Remove the engine compartment lamp. Remove the hood.

WARNING: THE COOLANT IN A RECENTLY OPERATED ENGINE IS HOT AND PRESSURIZED. USE CARE TO PREVENT SCALDING BY HOT COOLANT. CAREFULLY RELEASE THE PRESSURE BEFORE REMOVING THE RADIATOR DRAIN COCK AND CAP.

- (3) Loosen the radiator drain cock and radiator cap to drain the coolant. DO NOT waste usable coolant. If the solution is clean, drain the coolant into a clean container for reuse.
- (4) Remove the air cleaner assembly (Fig. 47).
- (5) Remove the lower radiator hose.

REMOVAL AND INSTALLATION (Continued)

80bcea63

Fig. 47 Air Cleaner and Resonator Removal and Installation

- 1 - AIR CLEANER ASSEMBLY
- 2 - NUT AND WASHER
- 3 - RESONATOR ASSEMBLY
- 4 - AIR INLET HOSE

(6) Remove the upper radiator hose and coolant recovery hose (Fig. 48).

(7) Remove the fan shroud (Fig. 48).

Fig. 48 Upper Radiator Hose, Coolant Recovery Hose & Fan Shroud

- 1 - UPPER RADIATOR HOSE
- 2 - FAN SHROUD
- 3 - COOLANT RECOVERY HOSE

(8) Remove the radiator/condenser (if equipped with air conditioning).

(9) Remove fan assembly and install a 5/16 x 1/2-inch SAE capscrew through fan pulley into water pump flange. This will maintain the pulley and water pump in alignment when crankshaft is rotated.

(10) Disconnect the heater hoses.

(11) Disconnect the throttle cable, speed control cable (if equipped) and transmission cable (if equipped).

(12) Disconnect the body ground at the firewall.

(13) Disconnect the wires from the starter motor solenoid.

(14) Disconnect all fuel injection harness connections.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE TURNED OFF). BEFORE DISCONNECTING FUEL LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED.

(15) Perform fuel pressure release procedure. (refer to Group 14, Fuel System for the proper procedure).

(16) Remove latch clip and disconnect the quick-connect fuel line at the fuel rail

(17) Recover refrigerant (if equipped with A/C). (Refer to group 24, Heating and Air Conditioning for proper procedures.)

(18) Disconnect suction/discharge hose from A/C compressor and cap off ports to prevent intrusion of foreign material or refrigerant oil loss.

(19) Remove the power brake vacuum check valve from the booster, if equipped.

(20) If equipped with power steering :

(a) Disconnect the power steering hoses from the fittings at the steering gear.

(b) Drain the pump reservoir.

(c) Cap the fittings on the hoses and steering gear to prevent foreign material from entering the system.

(21) Identify, tag and disconnect all necessary wire connectors and vacuum hoses.

(22) Raise the vehicle.

(23) Remove the oil filter.

(24) Remove the starter motor.

(25) Disconnect the exhaust pipe from the exhaust manifold.

(26) Remove the flywheel housing access cover.

(27) Remove the upper flywheel and converter housing bolts and loosen the bottom bolts.

(28) Remove the engine support cushion-to-engine compartment bracket bolts.

(29) Remove the engine shock damper bracket from the sill.

(30) Lower the vehicle.

(31) Attach a lifting device to the engine.

REMOVAL AND INSTALLATION (Continued)

(32) Raise the engine slightly off the front supports.

(33) Place a support stand under the converter or flywheel housing.

(34) Lift the engine out of the engine compartment and install on an engine stand.

(35) Install the oil filter to keep foreign material out of the engine.

INSTALLATION

(1) Remove the oil filter.

(2) Lift the engine off the stand and lower it into the engine compartment. For easier installation, it may be useful to remove the engine support cushions from the engine support brackets as an aide for alignment of the engine-to-transmission.

(3) Insert the transmission shaft into the clutch spline. (M/T models)

(4) Align the flywheel housing with the engine.

(5) Install and tighten the flywheel housing lower bolts.

(6) Install the engine support cushions (if removed).

(7) Lower the engine and engine support cushions onto the engine compartment brackets.

(8) Remove the engine lifting device.

(9) Raise the vehicle.

(10) Install the converter-housing access cover.

(11) Install the exhaust pipe support.

(12) Install the starter motor and connect the cable. Tighten the bolts to 45 N·m (33 ft. lbs.) torque.

(13) Tighten the engine support cushion through-bolt nuts.

(14) Connect the exhaust pipe to the manifold.

(15) Install the oil filter.

(16) Lower the vehicle.

(17) Connect the coolant hoses and tighten the clamps.

(18) If equipped with power steering:

(a) Remove the protective caps

(b) Connect the hoses to the fittings at the steering gear. Tighten the nut to 52 N·m (38 ft. lbs.) torque.

(c) Fill the pump reservoir with fluid.

(19) Remove the pulley-to-water pump flange alignment capscrew and install the fan assembly.

(20) Install the fan shroud and radiator and condenser (if equipped with air conditioning).

(21) Connect the radiator hoses.

(22) Connect the oxygen sensor wire connector.

(23) Connect the throttle cable and install the rod. Connect the transmission and speed control cables (if equipped)

(24) Connect the fuel supply line to the injector rail. push until a "click" is heard. Re-install latch clip.

(25) Connect all the vacuum hoses and wire connectors.

(26) Connect suction/discharge hose to compressor. (if equipped)

(27) Fill the power steering reservoir.

(28) Connect the battery cables.

(29) Install the air cleaner (Fig. 47).

(30) Install the hood.

(31) Add engine oil and coolant.

(32) Start the engine and inspect for leaks.

(33) Stop the engine and check the fluid levels.

Add fluid, as required.

(34) Recharge air conditioning (Refer to group 24, Heating and Air Conditioning for proper procedures).

INTAKE MANIFOLD

REMOVAL

(1) Disconnect the battery negative cable.

(2) Remove the air inlet hose and resonator from the throttle body and air cleaner (Fig. 49).

80bcea63

Fig. 49 Air Cleaner, Resonator and air Inlet Hose Removal and Installation

1 - AIR CLEANER ASSEMBLY

2 - NUT AND WASHER

3 - RESONATOR ASSEMBLY

4 - AIR INLET HOSE

(3) Loosen the accessory drive belt tension and remove the belt from the power steering pump (refer to Group 07, Cooling Systems for proper procedures).

(4) Remove the power steering pump and brackets from the water pump and intake manifold. Secure power steering pump and bracket out of the way.

REMOVAL AND INSTALLATION (Continued)

(5) Perform fuel system pressure release procedure (refer to Group 14, Fuel System for correct procedure).

(6) Disconnect fuel supply tube from the fuel rail. Some fuel lines require a special tool for removal/installation (refer to Group 14, Fuel System - Quick Connect Fittings).

(7) Disconnect the accelerator cable, the cruise control cable (if equipped), and the transmission line pressure cable (if equipped) from the throttle body and remove them from the cable bracket.

CAUTION: When disconnecting the cruise control connector at the throttle body, **DO NOT** pry the connector off with pliers or screwdriver. Use finger pressure only. Prying the connector off could break it.

(8) Disconnect the electrical connectors. Pull the harnesses away from the manifold and secure them so they do not interfere with the manifold removal and installation process.

- The throttle position sensor.
- The idle air control motor.
- The coolant temperature sensor at the thermostat.
- The manifold air temperature sensor at the intake manifold.
- The fuel injectors.
- The oxygen sensor.

(9) Disconnect the crankcase ventilation (CCV) vacuum hose and manifold absolute pressure (MAP) sensor vacuum hose connector at the intake manifold.

(10) Disconnect vacuum hose from vacuum port on the intake manifold.

(11) Disconnect CCV hose at the cylinder head cover (Fig. 50).

(12) Remove the molded vacuum harness.

(13) Disconnect the vacuum brake booster hose at the intake manifold.

(14) Remove bolts 2 through 5 securing the intake manifold to the cylinder head (Fig. 51). Slightly loosen bolt No.1 and nuts 6 and 7.

(15) Remove the intake manifold and gaskets. Drain the coolant from the manifold.

INSTALLATION

(1) Clean the intake manifold and cylinder head mating surfaces. **DO NOT allow foreign material to enter either the intake manifold or the ports in the cylinder head.**

(2) Install the new intake manifold gasket over the locating dowels.

(3) Position the manifold in place and finger tighten the mounting bolts.

8056d9f4

Fig. 50 Crankcase Ventilation (CCV) Hose—2.5L Engine

- 1 - AIR INLET FITTING
- 2 - AIR FILTER COVER
- 3 - FIXED ORIFICE FITTING

(4) Tighten the fasteners in sequence and to the specified torque (Fig. 51).

- Fastener No.1—Tighten to 41 N·m (30 ft. lbs.) torque.
- Fasteners Nos.2 through 5—Tighten to 31 N·m (23 ft. lbs.) torque.
- Fasteners Nos.6 and 7—Tighten to 23 N·m (17 ft. lbs.) torque.

(5) Connect fuel supply tube to the fuel rail inlet. Push tube until a "click" is heard. **Before connecting the fuel line to the fuel rail replace the O-rings at the quick-connect fuel line coupling.**

(6) Pull out on the fuel supply tube to ensure that it is locked in place.

(7) Connect the molded vacuum hoses to the vacuum port on the intake manifold and the cylinder head cover.

(8) Connect the electrical connectors.

- The throttle position sensor.
- The idle air control motor.
- The coolant temperature sensor at the thermostat housing.
- The fuel injectors.
- The air manifold temperature sensor.
- The oxygen sensor.

(9) Connect the CCV vacuum hose and MAP sensor vacuum hose connectors to the throttle body.

REMOVAL AND INSTALLATION (Continued)

(10) Install the power steering pump and bracket assembly to the water pump and intake manifold. Hand start the three (3) tensioner bracket to p/s pump to intake manifold bolts and the two (2) tensioner bracket to water pump bolts.

(11) Tighten the power steering pump bolts to 28 N·m (21 ft. lbs.) Tighten the tensioner bracket to water pump bolts to 28 N·m (21 ft. lbs.).

(12) Connect the accelerator cable, cruise control cable (if equipped), and the transmission line pressure cable (if equipped) to the hold-down bracket and the throttle lever.

(13) Install and tension the accessory drive belt. Refer to Group 7, Cooling System for the proper procedure.

CAUTION: Ensure that the accessory drive belt is routed correctly. Failure to do so can cause the water pump to turn in the opposite direction resulting in engine overheating. Refer to Group 7, Cooling System for the proper procedure.

(14) Connect the air inlet hose and resonator to the throttle body and the air cleaner.

(15) Connect the battery negative cable.

(16) Start the engine and check for leaks.

EXHAUST MANIFOLD

REMOVAL

- (1) Disconnect the battery negative cable.
- (2) Raise the vehicle.
- (3) Disconnect the exhaust pipe from the engine exhaust manifold.
- (4) Lower the vehicle.
- (5) Remove intake manifold (refer to procedure in this section)
- (6) Remove fasteners 2 through 5 and remove the intake manifold (Fig. 51).
- (7) Remove fasteners 1, 6 and 7 and remove the engine exhaust manifold (Fig. 51).

INSTALLATION

- (1) Clean the intake and engine exhaust manifolds and cylinder head mating surfaces. **DO NOT allow foreign material to enter either the intake manifold or the ports in the cylinder head.**
- (2) Install a new intake manifold gasket over the alignment dowels on the cylinder head.
- (3) Install the engine exhaust manifold assembly. **Exhaust manifold must be centrally located over the end studs and spacer (Fig. 51).**
- (4) Tighten bolt No.1 to 41 N·m (30 ft. lbs.) torque (Fig. 51).
- (5) Install the intake manifold on the cylinder head dowels (Fig. 51).

J9211-5

Fig. 51 Intake/Exhaust Manifold Removal/Installation—2.5L Engine

(6) Install bolts 2 through 5 (Fig. 51). Tighten these bolts to 31 N·m (23 ft. lbs.) torque.

(7) Install new engine exhaust manifold spacers over the engine exhaust manifold mounting studs in the cylinder head (Fig. 51).

(8) Tighten nuts 6 and 7 to 23 N·m (17 ft. lbs.) torque (Fig. 51).

(9) Install all components to the intake manifold.

(10) Raise the vehicle.

(11) Connect the exhaust pipe to the engine exhaust manifold. Tighten the bolts to 31 N·m (23 ft. lbs.) torque.

(12) Lower the vehicle.

(13) Connect the battery negative cable.

(14) Start the engine and check for leaks.

CYLINDER HEAD COVER

A cured gasket is part of the engine cylinder head cover.

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Disconnect the Crankcase Ventilation (CCV) vacuum hose from engine cylinder head cover (Fig. 52).
- (3) Remove the air inlet hose and resonator from the air cleaner and throttle body.
- (4) Remove the engine cylinder head cover mounting bolts.
- (5) Remove the engine cylinder head cover (Fig. 52).
- (6) Remove any original sealer from the cover sealing surface of the engine cylinder head and clean the surface using a fabric cleaner.
- (7) Remove all residue from the sealing surface using a clean, dry cloth.

REMOVAL AND INSTALLATION (Continued)

8056d9f4

Fig. 52 Engine Cylinder Head Cover

- 1 - AIR INLET FITTING
- 2 - AIR FILTER COVER
- 3 - FIXED ORIFICE FITTING

INSTALLATION

(1) Inspect the engine cylinder head cover for cracks. Replace the cover, if cracked.

NOTE: The original dark grey gasket material should NOT be removed. If sections of the gasket material are missing or are compressed, replace the engine cylinder head cover. However, sections with minor damage such as small cracks, cuts or chips may be repaired with a hand held applicator. The new material must be smoothed over to maintain gasket height. Allow the gasket material to cure prior to engine cylinder head cover installation.

(2) If a replacement cover is installed, transfer the CCV valve grommet the oil filler cap from the original cover to the replacement cover.

(3) Install engine cylinder head cover. Tighten the mounting bolts to 13 N·m (115 in. lbs.) torque.

(4) Connect the CCV hoses (Fig. 52).

(5) Connect negative cable to battery.

(6) Install the air inlet hose and resonator.

ROCKER ARMS AND PUSH RODS

This procedure can be done with the engine in or out of the vehicle.

REMOVAL

(1) Remove the engine cylinder head cover. (Refer to procedure in this section)

(2) Check for rocker arm bridges which are causing misalignment of the rocker arm to valve tip area.

(3) Remove the capscrews at each bridge and pivot assembly (Fig. 53). Alternately loosen the capscrews one turn at a time to avoid damaging the bridges.

(4) Remove the bridges, pivots and corresponding pairs of rocker arms (Fig. 53). Place them on a bench in the same order as removed.

(5) Remove the push rods and place them on a bench in the same order as removed.

J8909-8

Fig. 53 Rocker Arm Assembly

- 1 - CAPSCREWS
- 2 - BRIDGE
- 3 - PIVOT ASSEMBLY
- 4 - PUSH RODS
- 5 - ROCKER ARMS

(6) Clean all the components with cleaning solvent.

(7) Use compressed air to blow out the oil passages in the rocker arms and push rods.

INSTALLATION

(1) Lubricate the ball ends of the push rods with Mopar Engine Oil Supplement, or equivalent and install push rods in their original locations. Ensure that the bottom end of each push rod is centered in the tappet plunger cap seat.

(2) Using Mopar Engine Oil Supplement, or equivalent, lubricate the area of the rocker arm that the

REMOVAL AND INSTALLATION (Continued)

pivot contacts. Install rocker arms, pivots and bridge above each cylinder in their original position.

(3) Loosely install the capscrews through each bridge.

(4) At each bridge, tighten the capscrews alternately, one turn at a time, to avoid damaging the bridge. Tighten the capscrews to 28 N·m (21 ft. lbs.) torque.

(5) Install the engine cylinder head cover.

VALVE SPRING AND SEAL

This procedure can be done with the engine cylinder head installed on the block.

REMOVAL

Each valve spring is held in place by a retainer and a set of conical valve locks. The locks can be removed only by compressing the valve spring.

(1) Remove the engine cylinder head cover. Refer to procedure in this section.

(2) Remove cap screws, bridge and pivot assemblies and rocker arms for access to each valve spring to be removed.

(3) Remove push rods. **Retain the push rods, bridges, pivots and rocker arms in the same order and position as removed.**

(4) Inspect the springs and retainer for cracks and possible signs of weakening.

(5) Remove the spark plug(s) adjacent to the cylinder(s) below the valve springs to be removed.

(6) Install a 14 mm (1/2 inch) (thread size) air hose adaptor in the spark plug hole.

(7) Connect an air hose to the adapter and apply air pressure slowly. Maintain at least 621 kPa (90 psi) of air pressure in the cylinder to hold the valves against their seats. For vehicles equipped with an air conditioner, use a flexible air adaptor when servicing the No.1 cylinder.

(8) Tap the retainer or tip with a rawhide hammer to loosen the lock from the retainer. Use Valve Spring Compressor Tool MD-998772A to compress the spring and remove the locks (Fig. 54).

(9) Remove valve spring and retainer (Fig. 54).

(10) Remove valve stem oil seals (Fig. 54). Note the valve seals are different for intake and exhaust valves. The top of each seal is marked either INT (intake/black in color) or EXH (exhaust/brown in color). DO NOT mix the seals.

INSTALLATION

Inspect the valve stems, especially the grooves. An Arkansas smooth stone should be used to remove nicks and high spots.

80b7704b

Fig. 54 Valve and Valve Components

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

CAUTION: Install oil seals carefully to prevent damage from the sharp edges of the valve spring lock groove.

(1) Lightly push the valve seal over the valve stem and valve guide boss. Be sure the seal is completely seated on the valve guide boss.

(2) Install valve spring and retainer.

(3) Compress the valve spring with Valve Spring Compressor Tool MD-998772A and insert the valve locks. Release the spring tension and remove the tool. Tap the spring from side-to-side to ensure that the spring is seated properly on the engine cylinder head.

(4) Release air pressure and disconnect the air hose. Remove the adaptor from the spark plug hole and install the spark plug.

(5) Repeat the procedures for each remaining valve spring to be removed.

(6) Install the push rods. Ensure the bottom end of each rod is centered in the plunger cap seat of the hydraulic valve tappet.

(7) Install the rocker arms, pivots and bridge at their original location.

(8) Tighten the bridge cap screws alternately, one at a time, to avoid damaging the bridge. Tighten the cap screws to 28 N·m (21 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

- (9) Install the engine cylinder head cover.

CYLINDER HEAD

This procedure can be done with the engine in or out of the vehicle.

REMOVAL

- (1) Disconnect negative cable from battery.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAIN COCK WITH THE SYSTEM HOT AND PRESSURIZED BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

(2) Drain the coolant and disconnect the hoses at the engine thermostat housing. **DO NOT** waste reusable coolant. If the solution is clean and is being drained only to service the engine or cooling system, drain the coolant into a clean container for reuse.

- (3) Remove the air cleaner assembly.

(4) Remove the engine cylinder head cover. (Refer to procedure in this section)

(5) Remove the capscrews, bridge and pivot assemblies and rocker arms (Fig. 55).

(6) Remove the push rods (Fig. 55). **Retain the push rods, bridges, pivots and rocker arms in the same order as removed.**

(7) Loosen the accessory drive belt at the power steering pump bracket, if equipped or at the idler pulley bracket (refer to Group 7, Cooling System for the proper procedure).

(8) If equipped with air conditioning, perform the following:

- (a) Remove the bolts from the A/C compressor mounting bracket and set the compressor aside.

- (b) Remove the air conditioner compressor bracket bolts from the engine cylinder head.

- (c) Loosen the through bolt at the bottom of the bracket.

(9) If equipped, disconnect the power steering pump bracket. Set the pump and bracket aside. **DO NOT** disconnect the hoses.

(10) Perform fuel pressure release procedure (Refer to Group 14, fuel systems for proper procedures).

(11) Remove the latch clip and disconnect the fuel supply hose.

(12) Remove the intake and engine exhaust manifolds from the engine cylinder head (refer to Group 11, Exhaust System and Intake Manifold for the proper procedures).

(13) Number and disconnect the ignition wires and remove the spark plugs.

(14) Disconnect the coolant temperature sending unit connector.

- (15) Remove the engine cylinder head bolts.

J8909-8

Fig. 55 Rocker Arm Assembly

- 1 - CAPSCREWS
2 - BRIDGE
3 - PIVOT ASSEMBLY
4 - PUSH RODS
5 - ROCKER ARMS

(16) Remove the engine cylinder head and gasket (Fig. 56).

(17) If this was the first time the bolts were removed, put a paint dab on the top of the bolt. If the bolts have a paint dab on the top of the bolt or it isn't known if they were used before, discard the bolts.

(18) Stuff clean lint free shop towels into the cylinder bores.

NOTE: If valves, springs, or seals are to be inspected/replaced at this time, refer to Valves and Valve Springs later in this section for proper inspection procedures.

INSTALLATION

The engine cylinder head gasket is a composition gasket. The gasket is to be installed **DRY**. **DO NOT use a gasket sealing compound on the gasket.**

If the engine cylinder head is to be replaced and the original valves used, measure the valve stem diameter. Only standard size valves can be used with a service replacement engine cylinder head unless the replacement head valve stem guide bores are reamed to accommodate oversize valve stems. Remove all carbon buildup and reface the valves.

REMOVAL AND INSTALLATION (Continued)

Fig. 56 Engine Cylinder Head Assembly

- 1 - BRIDGE
- 2 - PIVOT ASM.
- 3 - ROCKER ARM
- 4 - CYLINDER HEAD
- 5 - HEAD GASKET
- 6 - PUSH ROD

(1) Fabricate two engine cylinder head alignment dowels from used head bolts (Fig. 57). Use the longest head bolt. Cut the head of the bolt off below the hex head. Then cut a slot in the top of the dowel to allow easier removal with a screwdriver.

Fig. 57 Fabricate Alignment Dowels

- 1 - USED CYLINDER HEAD BOLT
- 2 - SLOT

- (2) Install one dowel in bolt hole No.10 and the other dowel in bolt hole No.8 (Fig. 58).
- (3) Remove the shop towels from the cylinder bores. Coat the bores with clean engine oil.
- (4) Place the engine cylinder head gasket (with the numbers facing up) over the dowels.
- (5) Place the engine cylinder head over the dowels.

Fig. 58 Alignment Dowel Locations

- 1 - ALIGNMENT DOWEL
- 2 - ALIGNMENT DOWEL

CAUTION: Engine cylinder head bolts should be reused only once. Replace the head bolts if they were used before or if they have a paint dab on the top of the bolt.

- (6) Coat the threads of bolt No.7, only, with Loctite PST sealant or equivalent.
- (7) Install all head bolts, except No.8 and No.10.
- (8) Remove the dowels.
- (9) Install No.8 and No.10 head bolts.

CAUTION: During the final tightening sequence, bolt No.7 will be tightened to a lower torque than the rest of the bolts. **DO NOT** overtighten bolt No.7.

(10) Tighten the engine cylinder head bolts in sequence according to the following procedure (Fig. 59) :

- (a) Tighten all bolts in sequence (1 through 10) to 30 N·m (22 ft. lbs.) torque.
- (b) Tighten all bolts in sequence (1 through 10) to 61 N·m (45 ft. lbs.) torque.
- (c) Check all bolts to verify they are set to 61 N·m (45 ft. lbs.) torque.
- (d) Tighten bolts (in sequence):
 - Bolts 1 through 6 to 149 N·m (110 ft. lbs.) torque.
 - Bolt 7 to 136 N·m (100 ft. lbs.) torque.
 - Bolts 8 through 10 to 149 N·m (110 ft. lbs.) torque.

(e) Check all bolts in sequence to verify the correct torque.

(f) If not already done, clean and mark each bolt with a dab of paint after tightening. Should you encounter bolts which were painted in an earlier service operation, replace them.

(11) Connect the coolant temperature sending unit connector.

(12) Install the spark plugs and tighten to 37 N·m (27 ft. lbs.) torque. Connect the ignition wires.

REMOVAL AND INSTALLATION (Continued)

Fig. 59 Engine cylinder head Bolt Tightening Sequence

(13) Install the intake and exhaust manifolds (refer to Group 11, Exhaust System and Intake Manifold for the proper procedures).

(14) Install the fuel supply line. Push until a "click" is heard. Reinstall latch clip.

(15) If equipped, attach the power steering pump and bracket.

(16) Install the push rods, rocker arms, pivots and bridges in the order they were removed.

(17) Install the engine cylinder head cover.

(18) Attach the air conditioning compressor mounting bracket to the engine cylinder head and block. Tighten the bolts to 40 N·m (30 ft. lbs.) torque.

(19) Attach the air conditioning compressor to the bracket. Tighten the bolts to 27 N·m (20 ft. lbs.) torque.

CAUTION: The accessory drive belt must be routed correctly. Incorrect routing can cause the water pump to turn in the opposite direction causing the engine to overheat.

(20) Install the accessory drive belt and correctly tension the belt (refer to Group 7, Cooling System for the proper procedure).

(21) Install the air cleaner assembly.

(22) Connect the hoses to the thermostat housing and fill the cooling system to the specified level (refer to Group 7, Cooling Systems for the proper procedure).

(23) Install the coolant temperature sending unit connector.

(24) Connect negative cable to battery.

(25) Connect the upper radiator hose and heater hose at the thermostat housing.

(26) Fill the cooling system. Check for leaks.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT

LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(27) Operate the engine with the radiator cap off. Inspect for leaks and continue operating the engine until the thermostat opens. Add coolant, if required.

CYLINDER HEAD

DISASSEMBLY

(1) Use Valve Spring Compressor Tool MD-998772A and compress each valve spring.

(2) Remove the valve locks, retainers, springs and valve stem oil seals. Discard the oil seals.

(3) Use an Arkansas smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.

(4) Remove the valves, and place them in a rack in the same order as removed.

ASSEMBLY

(1) Thoroughly clean the valve stems and the valve guide bores.

(2) Lightly lubricate the stem.

(3) Install the valve in the original valve guide bore.

(4) Install the replacement valve stem oil seals on the valve stems. If the 0.381 mm (0.015 inch) over-size valve stems are used, oversize oil seals are required.

(5) Position the valve spring and retainer on the engine cylinder head and compress the valve spring with Valve Spring Compressor Tool MD-998772A.

(6) Install the valve locks and release the tool.

(7) Tap the valve spring from side to side with a hammer to ensure that the spring is properly seated at the engine cylinder head. Also tap the top of the retainer to seat the valve locks.

HYDRAULIC TAPPETS

REMOVAL

Retain all the components in the same order as removed.

(1) Remove the engine cylinder head cover (refer to procedure earlier in this section)

(2) Remove the bridge and pivot assemblies and rocker arms by removing the capscrews at each bridge. Alternately loosen each capscrew, one turn at a time, to avoid damaging the bridges.

(3) Remove the push rods.

(4) Remove the tappets through the push rod openings in the cylinder head with a Hydraulic Valve Tappet Removal/Installation Tool (Fig. 60).

REMOVAL AND INSTALLATION (Continued)

J8909-96

Fig. 60 Hydraulic Valve Tappet Removal/Installation Tool

1 - HYDRAULIC VALVE TAPPET REMOVAL/INSTALLATION TOOL

INSTALLATION

It is not necessary to charge the tappets with engine oil. They will charge themselves within a very short period of engine operation.

- (1) Dip each tappet in Mopar Engine Oil Supplement, or equivalent.
- (2) Use Hydraulic Valve Tappet Removal/Installation Tool to install each tappet in the same bore from where it was originally removed.
- (3) Install the push rods in their original locations.
- (4) Install the rocker arms and bridge and pivot assemblies at their original locations. Loosely install the capscrews at each bridge.
- (5) Tighten the capscrews alternately, one turn at a time, to avoid damaging the bridges. Tighten the capscrews to 28 N·m (21 ft. lbs.) torque.
- (6) Install the engine cylinder head cover.

VIBRATION DAMPER

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the serpentine drive belt and fan shroud.
- (3) Remove the vibration damper retaining bolt and washer.
- (4) Use Vibration Damper Removal Tool 7697 to remove the damper from the crankshaft (Fig. 61).

INSTALLATION

- (1) Apply Mopar Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key.

J9009-20

Fig. 61 Vibration Damper Removal Tool 7697

1 - VIBRATION DAMPER REMOVAL TOOL
2 - WRENCH

With the key in position, align the keyway on the vibration damper hub with the crankshaft key and tap the damper onto the crankshaft.

- (2) Install the vibration damper retaining bolt and washer.
- (3) Tighten the damper retaining bolt to 108 N·m (80 ft. lbs.) torque.
- (4) Install the serpentine drive belt and tighten to the specified tension (refer to Group 7, Cooling Systems for the proper specifications and procedures).
- (5) Connect negative cable to battery.

TIMING CASE COVER OIL SEAL

REMOVAL

This procedure is done with the timing case cover installed.

- (1) Disconnect negative cable from battery.
- (2) Remove the serpentine drive belt.
- (3) Remove the vibration damper.
- (4) Remove the radiator shroud.
- (5) Carefully remove the oil seal. Make sure seal bore is clean.

INSTALLATION

- (1) Position the replacement oil seal on Timing Case Cover Alignment and Seal Installation Tool 6139 with seal open end facing inward. Apply a light film of Perfect Seal, or equivalent, on the outside diameter of the seal. Lightly coat the crankshaft with engine oil.
- (2) Position the tool and seal over the end of the crankshaft and insert a draw screw tool into Seal Installation Tool 6139 (Fig. 62). Tighten the nut against the tool until it contacts the cover.

REMOVAL AND INSTALLATION (Continued)

**Fig. 62 Timing Case Cover Oil Seal Installation**

- 1 - SEAL INSTALLATION TOOL
2 - DRAW SCREW TOOL

(3) Remove the tools. Apply a light film of engine oil on the vibration damper hub contact surface of the seal.

(4) Apply Mopar Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key inserted in the keyway in the crankshaft, install the vibration damper, washer and bolt. Lubricate and tighten the bolt to 108 N·m (80 ft. lbs.) torque.

(5) Install the serpentine belt and tighten to the specified tension (refer to Group 7, Cooling Systems for the proper specifications and procedures).

(6) Install the radiator shroud.

(7) Connect negative cable to battery.

TIMING CASE COVER**REMOVAL**

(1) Disconnect battery negative cable.

(2) Remove accessory drive belt (Refer to Group 07, Cooling System for proper procedure)

(3) Remove the accessory drive brackets that are attached to the timing case cover.

(4) Remove the fan and hub assembly and remove the fan shroud.

(5) Remove the A/C compressor (if equipped) and generator bracket assembly from the engine cylinder head and move to one side.

(6) Remove the vibration damper (Fig. 63).

(7) Remove the oil pan-to-timing case cover bolts and timing case cover-to-cylinder block bolts.

(8) Remove the timing case cover and gasket from the engine.

(9) Pry the crankshaft oil seal from the front of the timing case cover (Fig. 63).

**Fig. 63 Timing Case Cover Components**

- 1 - TIMING CASE COVER
2 - OIL SLINGER
3 - CRANKSHAFT OIL SEAL
4 - VIBRATION DAMPER PULLEY

INSTALLATION

(1) Clean the timing case cover, oil pan and cylinder block gasket surfaces.

(2) Install a new crankshaft oil seal in the timing case cover. The open end of the seal should be toward the inside of the cover. Support the cover at the seal area while installing the seal. Force it into position with Seal Installation Tool 6139.

(3) Position the gasket on the cylinder block.

(4) Position the timing case cover on the oil pan gasket and the cylinder block.

(5) Insert Timing Case Cover Alignment and Seal Installation Tool 6139 in the crankshaft opening in the cover (Fig. 64).

**Fig. 64 Timing Case Cover Alignment and Seal Installation Tool 6139**

- 1 - TIMING CASE COVER ALIGNMENT AND SEAL INSTALLATION TOOL

REMOVAL AND INSTALLATION (Continued)

(6) Install the timing case cover-to-cylinder block and the oil pan-to-timing case cover bolts.

(7) Tighten the 1/4 inch cover-to-block bolts to 7 N·m (60 in. lbs.) torque. Tighten the 5/16 inch front cover-to-block bolts to 22 N·m (192 in. lbs.) torque. Tighten the oil pan-to-cover bolts to 9.5 N·m (84 in. lbs.) torque.

(8) Remove the cover alignment tool.

(9) Apply a light film of engine oil on the vibration damper hub contact surface of the seal.

(10) Apply Mopar Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key inserted in the keyway in the crankshaft, install the vibration damper, washer and bolt. Lubricate and tighten the bolt to 108 N·m (80 ft. lbs.) torque.

(11) Install the A/C compressor (if equipped) and generator bracket assembly.

(12) Install the engine fan and hub assembly and shroud.

(13) Install the accessory drive belt and tighten to obtain the specified tension.

(14) Connect negative cable to battery.

TIMING CHAIN AND SPROCKETS

The chain drive system is equipped with a timing chain tensioner which reduces noise and prolongs timing chain life. In addition, it compensates for wear and temperature changes on the valve train for proper engine operation.

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the fan and shroud.
- (3) Remove the serpentine drive belt.
- (4) Remove the crankshaft vibration damper.
- (5) Remove the timing case cover.
- (6) Rotate crankshaft until the "0" timing mark is closest to and on the center line with camshaft sprocket timing mark (Fig. 65).

(7) Remove the oil slinger from the crankshaft.

(8) Remove the camshaft retaining bolt and remove the sprockets and chain as an assembly (Fig. 66).

(9) To replace the timing chain tensioner, the oil pan must be removed.

INSTALLATION

(1) Turn the tensioner lever to the unlocked (down) position (Fig. 67).

(2) Pull the tensioner block toward the tensioner lever to compress the spring. Hold the block and turn the tensioner lever to the lock position (Fig. 67).

(3) Apply Mopar Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key in the crankshaft keyway, install the

Fig. 65 Crankshaft—Camshaft Alignment

Fig. 66 Camshaft and Crankshaft Sprockets and Chain

1 - CAMSHAFT SPROCKET
2 - CRANKSHAFT SPROCKET
3 - CHAIN

crankshaft, camshaft sprockets and timing chain. Ensure the timing marks on the sprockets are properly aligned (Fig. 65).

(4) Install the camshaft sprocket retaining bolt and washer. Tighten the bolt to 108 N·m (80 ft. lbs.) torque.

(5) To verify correct installation of the timing chain, turn the crankshaft to position the camshaft sprocket timing mark as shown in (Fig. 68). Count the number of chain pins between the timing marks of both sprockets. There must be 20 pins.

(6) Turn the chain tensioner lever to the unlocked (down) position (Fig. 67).

(7) Install the oil slinger.

(8) Replace the oil seal in the timing case cover.

(9) Install the timing case cover and gasket.

REMOVAL AND INSTALLATION (Continued)

(10) With the key inserted in the keyway in the crankshaft, install the vibration damper, washer and bolt. Lubricate and tighten the bolt to 108 N·m (80 ft. lbs.) torque.

- (11) Install the fan and shroud.
- (12) Connect negative cable to battery.

CAMSHAFT

REMOVAL

WARNING: THE COOLANT IN A RECENTLY OPERATED ENGINE IS HOT AND PRESSURIZED. RELEASE THE PRESSURE BEFORE REMOVING THE DRAIN COCK, CAP AND DRAIN PLUGS.

- (1) Disconnect negative cable from battery.
- (2) Drain the cooling system. DO NOT waste reusable coolant. If the solution is clean, drain it into a clean container for reuse.
- (3) Remove the radiator or radiator and condenser, if equipped with A/C.
- (4) Scribe a mark on the distributor housing in line with the lip of the rotor.
- (5) Scribe a mark on the distributor housing near the clamp and continue the scribe mark on the cylinder block in line with the distributor mark.
- (6) For ease of installation, note the position of the rotor and distributor housing in relation to adjacent engine components.
- (7) Remove the distributor and ignition wires.
- (8) Remove the engine cylinder head cover.
- (9) Remove the rocker arms, bridges and pivots.
- (10) Remove the push rods.
- (11) Remove the hydraulic valve tappets from the engine cylinder head.
- (12) Remove the vibration damper.
- (13) Remove the timing case cover.
- (14) Remove the timing chain and sprockets.
- (15) Remove the camshaft (Fig. 69).

J9009-31

Fig. 69 Camshaft

- 1 - CAMSHAFT
- 2 - CRANKSHAFT

INSTALLATION

- (1) Inspect the cam lobes for wear.

REMOVAL AND INSTALLATION (Continued)

(2) Inspect the bearing journals for uneven wear pattern or finish.

(3) Inspect the bearings for wear.

(4) Inspect the distributor drive gear for wear.

(5) If the camshaft appears to have been rubbing against the timing case cover, examine the oil pressure relief holes in the rear cam journal. The oil pressure relief holes must be free of debris.

(6) Lubricate the camshaft with Mopar Engine Oil Supplement, or equivalent.

(7) Carefully install the camshaft to prevent damage to the camshaft bearings (Fig. 69).

(8) Turn the tensioner lever to the unlocked (down) position (Fig. 70).

(9) Pull the tensioner block toward the tensioner lever to compress the spring. Hold the block and turn the tensioner lever to the lock position (Fig. 70).

(10) Install the timing chain, crankshaft sprocket and camshaft sprocket with the timing marks aligned.

(11) Install the camshaft sprocket retaining bolt and washer. Tighten the bolt to 108 N·m (80 ft. lbs.) torque.

(12) Release the timing chain tensioner by moving the lever to the unlock position (Fig. 70).

(13) Install the timing case cover with a replacement oil seal (Fig. 71). Refer to Timing Case Cover Installation.

(14) Install the vibration damper.

Fig. 70 Loading Timing Chain Tensioner

- 1 - LOCK
- 2 - UNLOCK
- 3 - TENSIONER BLOCK
- 4 - TENSIONER LEVER

(15) Install the hydraulic valve tappets.

(16) Install the push rods.

(17) Install the rocker arms, bridges and pivots.

(18) Install the engine cylinder head cover.

Fig. 71 Timing Case Cover

- 1 - TIMING CASE COVER
- 2 - CAMSHAFT
- 3 - CRANKSHAFT

(19) Position the oil pump gear. Refer to Distributor in the Component Removal/Installation section of Group 8D, Ignition Systems.

(20) Install the distributor and ignition wires. Refer to Distributor in the Component Removal/Installation section of Group 8D, Ignition Systems.

(21) Install the radiator or radiator and condenser, if equipped with A/C.

(22) Fill the cooling system.

(23) Connect negative cable to battery.

CAMSHAFT PIN REPLACEMENT

REMOVAL

WARNING: DO NOT LOOSEN THE RADIATOR DRAIN COCK WITH THE SYSTEM HOT AND PRESSURIZED BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

- (1) Disconnect negative cable from battery.
- (2) Drain the radiator. DO NOT waste reusable coolant. Drain the coolant into a clean container.
- (3) Remove the fan and shroud.
- (4) Disconnect the radiator overflow tube, radiator hoses, automatic transmission fluid cooler pipes (if equipped).
- (5) Remove the radiator.
- (6) If equipped with air conditioning:

CAUTION: DO NOT loosen or disconnect any air conditioner system fittings. Move the condenser and receiver/drier aside as a complete assembly.

REMOVAL AND INSTALLATION (Continued)

- (a) Remove the A/C compressor serpentine drive belt idler pulley.
- (b) Disconnect and remove the generator.
- (c) Remove the A/C condenser attaching bolts and move the condenser and receiver/drier assembly up and out of the way.
- (7) Remove the serpentine drive belt.
- (8) Remove the crankshaft vibration damper.
- (9) Remove the timing case cover. Clean the gasket material from the cover.
- (10) Rotate crankshaft until the crankshaft sprocket timing mark is closest to and on the center line with the camshaft sprocket timing mark (Fig. 72).

**Fig. 72 Timing Chain Alignment**

1 - TIMING MARKS

- (11) Remove camshaft sprocket retaining bolt.
- (12) Remove the crankshaft oil slinger.
- (13) Remove the sprockets and chain as an assembly (Fig. 73).

CAUTION: The following procedural step must be accomplished to prevent the camshaft from damaging the rear camshaft plug during pin installation.

- (14) Inspect the damaged camshaft pin.
- (15) If the pin is a spring-type pin, remove the broken pin by inserting a self-tapping screw into the pin and carefully pulling the pin from the camshaft.
- (16) If the pin is a dowel-type pin, center-punch it. Ensure the exact center is located when center-punching the pin.

CAUTION: Cover the opened oil pan area to prevent metal chips from entering the pan.

- (17) Drill into the pin center with a 4 mm (5/32 inch) drill bit.
- (18) Insert a self-tapping screw into the drilled pin and carefully pull the pin from the camshaft.

**Fig. 73 Camshaft and Crankshaft Sprocket and Chain**

- 1 - CAMSHAFT SPROCKET
- 2 - CRANKSHAFT SPROCKET
- 3 - CHAIN

INSTALLATION

- (1) Clean the camshaft pin hole.
- (2) Compress the center of the replacement spring pin with vise grips.
- (3) Carefully drive the pin into the camshaft pin hole until it is seated.
- (4) Install the camshaft sprocket, crankshaft sprocket and timing chain with the timing marks aligned (Fig. 72).
- (5) To verify correct installation of the timing chain, turn the crankshaft to position the camshaft sprocket timing mark as shown in (Fig. 74). Count the number of chain pins between the timing marks of both sprockets. There must be 20 pins.
- (6) Install the crankshaft oil slinger.
- (7) Tighten the camshaft sprocket bolt to 108 N·m (80 ft. lbs.) torque.
- (8) Check the valve timing.
- (9) Coat both sides of the replacement timing case cover gasket with gasket sealer. Apply a 3 mm (1/8 inch) bead of Mopar Silicone Rubber Adhesive Sealant, or equivalent to the joint formed at the timing case cover and cylinder block.
- (10) Position the timing case cover on the oil pan gasket and the cylinder block.
- (11) Place Timing Case Cover Alignment and Seal Installation Tool 6139 in the crankshaft opening of the cover (Fig. 75).
- (12) Install the timing case cover-to-cylinder block bolts. Install the oil pan-to-timing case cover bolts.
- (13) Tighten the 1/4 inch cover-to-block bolts to 7 N·m (60 in. lbs.) torque. Tighten the 5/16 inch front cover-to-block bolts to 22 N·m (192 in. lbs.) torque. Tighten the oil pan-to-cover 1/4 inch bolts to 14 N·m

REMOVAL AND INSTALLATION (Continued)

**Fig. 74 Verify Crankshaft—Camshaft Installation**

- 1 - CAMSHAFT SPROCKET
- 2 - 20 PINS
- 3 - CRANKSHAFT SPROCKET
- 4 - TIMING MARKS

**Fig. 75 Timing Case Cover Alignment and Seal Installation Tool 6139**

- 1 - TIMING CASE COVER ALIGNMENT AND SEAL INSTALLATION TOOL

(120 in. lbs.) torque. Tighten the oil pan-to-cover 5/16 inch bolts to 18 N·m (156 in. lbs.) torque.

(14) Remove the cover alignment tool and install a replacement oil seal into the cover.

(15) Install the vibration damper on the crankshaft.

(16) Lubricate and tighten the damper bolt to 108 N·m (80 ft. lbs.) torque.

(17) If equipped with air conditioning:

(a) Install the A/C compressor serpentine drive belt idler pulley.

(b) Install the generator.

(c) Install the A/C condenser and receiver/drier assembly.

(18) Install the serpentine drive belt on the pulleys and tighten (refer to Group 7, Cooling System for the specifications and procedures).

(19) Install the radiator. Connect the radiator hoses and automatic transmission fluid cooler pipes, if equipped. Fill the cooling system.

(20) Install the fan and shroud.

(21) Connect negative cable to battery.

CAMSHAFT BEARINGS

The camshaft rotates within four steel-shelled, babbitt-lined bearings that are pressed into the cylinder block and then line reamed. The camshaft bearing bores and bearing diameters are not the same size. They are stepped down in 0.254 mm (0.010 inch) increments from the front bearing (largest) to the rear bearing (smallest). This permits easier removal and installation of the camshaft. The camshaft bearings are pressure lubricated.

NOTE: It is not advisable to attempt to replace camshaft bearings unless special removal and installation tools are available, such as recommended tool 8544 Camshaft Bushing Remover Installer.

Camshaft end play is maintained by the load placed on the camshaft by the oil pump and distributor drive gear. The helical cut of the gear holds the camshaft sprocket thrust face against the cylinder block face.

CRANKSHAFT MAIN BEARINGS**REMOVAL**

(1) Disconnect negative cable from battery.

(2) Remove the spark plugs.

(3) Raise the vehicle.

(4) Remove the oil pan and oil pump.

(5) Remove only one main bearing cap and lower insert at a time (Fig. 76).

(6) Remove the lower insert from the bearing cap.

(7) Remove the upper insert by LOOSENING (DO NOT REMOVE) all of the other bearing caps. Now insert a small cotter pin tool in the crankshaft journal oil hole. Bend the cotter pin as illustrated to fabricate the tool (Fig. 77). With the cotter pin tool in place, rotate the crankshaft so that the upper bearing insert will rotate in the direction of its locking tab. Because there is no hole in the No.3 main journal, use a tongue depressor or similar soft-faced tool

REMOVAL AND INSTALLATION (Continued)

J8909-144

Fig. 76 Removing Main Bearing Caps and Lower Inserts

- 1 - CONNECTING ROD JOURNAL
2 - MAIN BEARING CAPS

J9009-49

Fig. 77 Removing Upper Inserts

- 1 - COTTER PIN
2 - FABRICATED TOOL
3 - BEARING INSERT
4 - TONGUE DEPRESSOR

to remove the bearing insert (Fig. 77). After moving the insert approximately 25 mm (1 inch), it can be removed by applying pressure under the tab.

(8) Using the same procedure described above, remove the remaining bearing inserts one at a time for inspection.

INSTALLATION

(1) Lubricate the bearing surface of each insert with engine oil.

(2) Loosen all the main bearing caps. Install the main bearing upper inserts.

(3) Install the lower bearing inserts into the main bearing caps.

(4) Install the main bearing cap(s) and lower insert(s).

(5) Clean the rear main bearing cap (No.5) mating surfaces.

(6) Apply Mopar® Gasket Maker, or equivalent on the rear bearing cap (Fig. 78). The bead should be 3 mm (0.125 in) thick. DO NOT apply Mopar® Gasket Maker, or equivalent to the lip of the seal.

(7) Install the rear main bearing cap. DO NOT strike the cap more than twice for proper engagement.

(8) Tighten the bolts of caps 1, 3, 4 and 5 to 54 N·m (40 ft. lbs.) torque. Now tighten these bolts to 95 N·m (70 ft. lbs.) torque. Finally, tighten these bolts to 108 N·m (80 ft. lbs.) torque.

J9509-90

Fig. 78 Location of Mopar® Gasket Maker

- 1 - MOPAR® GASKET MAKER (OR EQUIVALENT)
2 - 19 mm (.75 IN)
3 - 6 mm (0.025 IN)

REMOVAL AND INSTALLATION (Continued)

(9) Push the crankshaft forward and backward. Load the crankshaft front or rear and tighten cap bolt No.2 to 54 N·m (40 ft. lbs.) torque. Then tighten to 95 N·m (70 ft. lbs.) torque and finally tighten to 108 N·m (80 ft. lbs.) torque.

(10) Rotate the crankshaft after tightening each main bearing cap to ensure the crankshaft rotates freely.

(11) Check crankshaft end play. Crankshaft end play is controlled by the thrust bearing which is flange and installed at the No.2 main bearing position.

(a) Attach a magnetic base dial indicator to the cylinder block at either the front or rear of the engine.

(b) Position the dial indicator rod so that it is parallel to the center line of the crankshaft.

(c) Pry the crankshaft forward, position the dial indicator to zero.

(d) Pry the crankshaft forward and backward. Note the dial indicator readings. End play is the difference between the high and low measurements (Fig. 79). Correct end play is 0.038-0.165 mm (0.0015-0.0065 inch). The desired specifications are 0.051-0.064 mm (0.002-0.0025 inch).

(e) If end play is not within specification, inspect crankshaft thrust faces for wear. If no wear is apparent, replace the thrust bearing and measure end play. If end play is still not within specification, replace the crankshaft.

Fig. 79 Crankshaft End Play Measurement

- 1 - DIAL INDICATOR
2 - CRANKSHAFT

(12) If the crankshaft was removed, install the crankshaft into the cylinder block (refer to Cylinder Block - Assemble).

(13) Install the oil pan.

(14) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(15) Install new rearmain seal. Refer to Rear Main Seal in this section.

(16) Lower the vehicle.

(17) Install the spark plugs. Tighten the plugs to 37 N·m (27 ft. lbs.) torque.

(18) Fill the oil pan with engine oil to the safe mark on the dipstick level.

(19) Connect negative cable to battery.

OIL PAN

REMOVAL

(1) Disconnect negative cable from battery.

(2) Raise the vehicle.

(3) Remove the oil pan drain plug and drain the engine oil.

(4) Disconnect the exhaust pipe at the engine exhaust manifold.

(5) Disconnect the exhaust hanger at the catalytic converter and lower the pipe.

(6) Remove the engine starter motor.

(7) Remove the flywheel/torque converter housing access cover.

(8) Position a jack stand directly under the engine vibration damper.

(9) Place a piece of wood (2 x 2) between the jack stand and the engine vibration damper.

(10) Remove the engine mount through bolts.

(11) Using the jack stand, raise the engine until adequate clearance is obtained to remove the oil pan.

(12) If equipped, disconnect the transmission cooler lines and oxygen sensor harness from oil pan mounting studs.

(13) Remove the oil pan bolts and studs. Carefully remove the oil pan and gasket.

INSTALLATION

(1) Clean the block and pan gasket surfaces.

(2) Fabricate 4 alignment dowels from 1/4 x 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 80).

(3) Install two dowels in the timing case cover. Install the other two dowels in the cylinder block (Fig. 81).

(4) Apply Mopar® Silicone Adhesive Sealant onto the cylinder block in four location as shown (Fig. 82)

(5) Slide the one-piece gasket over the dowels and onto the block and timing case cover.

(6) Position the oil pan over the dowels and onto the gasket.

(7) Install the 1/4 inch oil pan bolts. Tighten these bolts to 9.5 N·m (84 in. lbs.) torque. Install the 5/16

REMOVAL AND INSTALLATION (Continued)

**Fig. 80 Fabrication of Alignment Dowels**

 2 - DOWEL HOLES
 3 - CYLINDER BLOCK
 4 - 5/16" HOLES

inch oil pan bolts (Fig. 83). Tighten these bolts to 15 N·m (132 in. lbs.) torque.

(8) Remove the dowels. Install the remaining 1/4 inch oil pan bolts. Tighten these bolts to 9.5 N·m (84 in. lbs.) torque.

(9) Lower the engine until it is properly located on the engine mounts.

(10) Install the through bolts and tighten the nuts.

(11) Lower the jack stand and remove the piece of wood.

(12) Install the flywheel and torque converter housing access cover.

(13) Install the engine starter motor.

(14) Connect the exhaust pipe to the hanger and to the engine exhaust manifold.

**Fig. 83 Position of 5/16 inch Oil Pan Bolts**

- 1 - OIL PAN
 2 - OIL PAN DRAIN PLUG

(15) Install the oil pan drain plug (Fig. 83). Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(16) Lower the vehicle.

(17) Connect negative cable to battery.

(18) Fill the oil pan with engine oil to the specified level.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(19) Start the engine and inspect for leaks.

OIL PUMP

The positive-displacement gear-type oil pump is driven by the distributor shaft, which is driven by a gear on the camshaft. Oil is siphoned into the pump

REMOVAL AND INSTALLATION (Continued)

through an inlet tube and strainer assembly that is pressed into the pump body.

The pump incorporates a nonadjustable pressure relief valve to limit maximum pressure to 517 kPa (75 psi). In the relief position, the valve permits oil to bypass through a passage in the pump body to the inlet side of the pump.

Oil pump removal or replacement will not affect the distributor timing because the distributor drive gear remains in mesh with the camshaft gear.

REMOVAL

- (1) Drain the engine oil.
- (2) Remove the oil pan.
- (3) Remove the pump-to-cylinder block attaching bolts. Remove the pump assembly with gasket (Fig. 84).

CAUTION: If the oil pump is not to be serviced, **DO NOT** disturb position of oil inlet tube and strainer assembly in pump body. If the tube is moved within the pump body, a replacement tube and strainer assembly must be installed to assure an airtight seal.

Fig. 84 Oil Pump Assembly

- 1 - OIL FILTER ADAPTOR
- 2 - BLOCK
- 3 - GASKET
- 4 - OIL INLET TUBE
- 5 - OIL PUMP
- 6 - STRAINER ASSEMBLY
- 7 - ATTACHING BOLTS

INSTALLATION

- (1) Install the oil pump on the cylinder block using a replacement gasket. Tighten the bolts to 23 N·m (17 ft. lbs.) torque.
- (2) Install the oil pan and gasket.
- (3) Fill the oil pan with oil to the specified level.

PISTON AND CONNECTING ROD

REMOVAL

- (1) Remove the engine cylinder head cover.
- (2) Remove the rocker arms, bridges and pivots.
- (3) Remove the push rods.
- (4) Remove the engine cylinder head.
- (5) Position the pistons one at a time near the bottom of the stroke. Use a ridge reamer to remove the ridge from the top end of the cylinder walls. Use a protective cloth to collect the cuttings.
- (6) Raise the vehicle.
- (7) Drain the engine oil.
- (8) Remove the oil pan and gasket.
- (9) Remove the connecting rod bearing caps and inserts. Mark the caps and rods with the cylinder bore location. The connecting rods and caps are stamped with a two letter combination (Fig. 85).

J9409-20

Fig. 85 Stamped Connecting Rods and Caps

- 1 - CONNECTING ROD CAP
- 2 - CONNECTING ROD

- (10) Lower the vehicle until it is about 2 feet from the floor.

CAUTION: Ensure that the connecting rod bolts **DO NOT** scratch the crankshaft journals or cylinder walls. Short pieces of rubber hose, slipped over the rod bolts will provide protection during removal.

- (11) Have an assistant push the piston and connecting rod assemblies up and through the top of the cylinder bores (Fig. 86).

REMOVAL AND INSTALLATION (Continued)

Fig. 86 Removal of Connecting Rod and Piston Assembly

- 1 - PISTON
2 - CONNECTING ROD
3 - CYLINDER BLOCK

INSTALLATION

(1) Clean the cylinder bores thoroughly. Apply a light film of clean engine oil to the bores with a clean lint-free cloth.

(2) Install the piston rings on the pistons if removed.

(3) Lubricate the piston and rings with clean engine oil.

CAUTION: Ensure that connecting rod bolts do not scratch the crankshaft journals or cylinder walls. Short pieces of rubber hose slipped over the connecting rod bolts will provide protection during installation.

(5) Use a piston ring compressor to install the connecting rod and piston assemblies through the top of the cylinder bores (Fig. 87).

(6) Ensure the arrow on the piston top points to the front of the engine (Fig. 87).

(7) Raise the vehicle.

(8) Each bearing insert is fitted to its respective journal to obtain the specified clearance between the bearing and the journal. In production, the select fit is obtained by using various-sized, color-coded bearing inserts as listed in the Connecting Rod Bearing Fitting Chart. The color code appears on the edge of

Fig. 87 Rod and Piston Assembly Installation

the bearing insert. The size is not stamped on inserts used for production of engines.

(9) The rod journal is identified during the engine production by a color-coded paint mark on the adjacent cheek or counterweight toward the flange (rear) end of the crankshaft. The color codes used to indicate journal sizes are listed in the Connecting Rod Bearing Fitting Chart.

(10) When required, upper and lower bearing inserts of different sizes may be used as a pair (refer to Connecting Rod Bearing Fitting Chart). A standard size insert is sometimes used in combination with a 0.025 mm (0.001 inch) undersize insert to reduce clearance 0.013 mm (0.0005 inch).

CAUTION: DO NOT intermix bearing caps. Each connecting rod and bearing cap are stamped with the cylinder number. The stamp is located on a machined surface adjacent to the oil squirt hole that faces the camshaft side of the cylinder block.

(11) Install the connecting rod bearing caps and inserts in the same positions as removed.

CAUTION: Verify that the oil squirt holes in the rods face the camshaft and that the arrows on the pistons face the front of the engine.

(13) Install the oil pan and gaskets as outlined in the installation procedure.

(14) Lower the vehicle.

(15) Install the engine cylinder head, push rods, rocker arms, bridges, pivots and engine cylinder head cover.

(16) Fill the crankcase with engine oil.

REAR MAIN OIL SEAL

REMOVAL

(1) Remove the flywheel or converter drive plate. Discard the old bolts.

REMOVAL AND INSTALLATION (Continued)

(2) Pry out the seal from around the crankshaft flange, making sure not to scratch or nick the crankshaft. (Fig. 88).

J8909-149

Fig. 88 Replacement of Rear Crankshaft Oil Seal

- 1 - CRANKSHAFT
2 - CRANKSHAFT OIL SEAL

INSTALLATION

(1) Wipe the seal surface area of the crankshaft until it is clean.

(2) Coat the outer lip of the replacement rear main bearing seal with engine oil.

(3) Carefully position the seal into place. Use rear main Seal Installer Tool 6271A to install the seal flush with the cylinder block.

CAUTION: The felt lip must be located inside the flywheel mounting surface. If the lip is not positioned correctly the flywheel could tear the seal.

(4) Install the flywheel or converter drive plate. New bolts **MUST** be used when installing the flywheel or converter plate. Tighten the new bolts to 68 N·m (50 ft. lbs.) torque. Turn the bolts an additional 60°.

DISASSEMBLY AND ASSEMBLY

CYLINDER BLOCK

DISASSEMBLY

(1) Drain the engine oil. Remove and discard the oil filter.

(2) Remove the water pump from the cylinder block.

(3) Remove the distributor from the cylinder block.

(4) Remove the vibration damper.

(5) Remove the timing case cover and lay the cover upside down.

(6) Position a drift punch into the slot in the back of the cover and tap the old seal out.

(7) Remove the timing chain bumper.

(8) Remove the oil slinger from crankshaft.

(9) Remove the camshaft retaining bolt and remove the sprockets and chain as an assembly.

(10) Remove the camshaft.

(11) Remove the oil pan and gasket.

(12) Remove the timing chain tensioner.

(13) Remove the front and rear oil galley plugs.

(14) Remove the connecting rods and the pistons. Remove the connecting rod and piston assemblies through the top of the cylinder bores.

(15) Remove the crankshaft.

ASSEMBLY

(1) Install the crankshaft.

(2) Install the connecting rods and the pistons through the top of the cylinder bores.

(3) Install the front and rear oil galley plugs.

(4) Install the timing chain tensioner.

(5) Install the camshaft.

(6) Install the sprockets and chain as an assembly.

(7) Install the oil slinger to the crankshaft.

(8) Install the timing chain bumper.

(9) Install the timing case cover seal.

(10) Install the timing case cover.

(11) Install the oil pan gasket and oil pan.

(12) Install the vibration damper.

(13) Install the water pump. Tighten the mounting bolts to 31 N·m (270 in. lbs.) torque.

(14) Remove the distributor from the cylinder block.

(15) Lubricate the oil filter seal with clean engine oil. Tighten oil filter to 18 N·m (13 ft. lbs.) torque.

(16) Install the engine into the vehicle.

(17) Fill the engine with clean lubrication oil.

(18) Fill the cooling system.

CLEANING AND INSPECTION

ROCKER ARMS AND PUSH RODS

CLEANING

Clean all the components with cleaning solvent.

Use compressed air to blow out the oil passages in the rocker arms and push rods.

INSPECTION

Inspect the pivot surface area of each rocker arm. Replace any that are scuffed, pitted, cracked or excessively worn.

CLEANING AND INSPECTION (Continued)

Inspect the valve stem tip contact surface of each rocker arm and replace any rocker arm that is deeply pitted.

Inspect each push rod end for excessive wear and replace as required. If any push rod is excessively worn because of lack of oil, replace it and inspect the corresponding hydraulic tappet for excessive wear.

Inspect the push rods for straightness by rolling them on a flat surface or by shining a light between the push rod and the flat surface.

A wear pattern along the length of the push rod is not normal. Inspect the engine cylinder head for obstruction if this condition exists.

ENGINE CYLINDER HEAD

CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and exhaust manifold and engine cylinder head mating surfaces. Remove all gasket material and carbon.

Check to ensure that no coolant or foreign material has fallen into the tappet bore area.

Remove the carbon deposits from the combustion chambers and top of the pistons.

INSPECTION

Use a straightedge and feeler gauge to check the flatness of the engine cylinder head and block mating surfaces.

CYLINDER BLOCK

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole, the filter bypass hole (Fig. 89).
- The front and rear oil galley holes (Fig. 90) (Fig. 91).
- The feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Mopar® Thread Sealant with Teflon to the threads of the front and rear oil galley plugs. Tighten the plugs to 41 N·m (30 ft. lbs.) torque.

INSPECTION

Inspect the cylinder bores for signs of scoring, pitting or cracks. If the cylinder bores are scorred or pitted the cylinder bores will require boring or honing to clean them up. Refer to Honing Cylinder Bores in this Section. If the cylinder bore(s) are cracked the cylinder block must be replaced.

Inspect the cylinder block to cylinder head mating surface for flatness and/or pitting.

DESCRIPTION AND OPERATION

ENGINE

DESCRIPTION

The 4.0 Liter (242 CID) six-cylinder engine is an In-line, lightweight, overhead valve engine.

This engine is designed for unleaded fuel. The engine cylinder head has dual quench-type combustion chambers that create turbulence and fast burning of the air/fuel mixture. This results in good fuel economy.

The cylinders are numbered 1 through 6 from front to rear. The firing order is 1-5-3-6-2-4 (Fig. 1).

FIRING ORDER:
1 5 3 6 2 4

80b770a2

Fig. 1 Engine Firing Order

The crankshaft rotation is clockwise, when viewed from the front of the engine. The crankshaft rotates within seven main bearings. The camshaft rotates within four bearings.

BUILD DATE CODE

The engine Build Date Code is located on a machined surface on the right side of the cylinder block between the No.2 and No.3 cylinders (Fig. 2).

The digits of the code identify:

- 1st Digit—The year (8 = 1998).
- 2nd & 3rd Digits—The month (01 - 12).
- 4th & 5th Digits—The engine type/fuel system/compression ratio (MX = A 4.0 Liter (242 CID) 8.7:1 compression ratio engine with a multi-point fuel injection system).
- 6th & 7th Digits—The day of engine build (01 - 31).

(1) **FOR EXAMPLE:** Code * 801MX12 * identifies a 4.0 Liter (242 CID) engine with a multi-point fuel injection system, 8.7:1 compression ratio and built on January 12, 1998.

LUBRICATION SYSTEM

DESCRIPTION

A gear-type positive displacement pump is mounted at the underside of the block opposite the No. 4 main bearing.

OPERATION

The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the drive and idler gears and pump body, then forced through the outlet to the block. An oil gallery in the block channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the main gallery which extends the entire length of the block.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals (except number 4 main bearing journal) to the connecting rod journals. Each connecting rod bearing cap has a small squirt hole, oil passes through the squirt hole and is thrown off as the rod rotates. This oil throwoff lubricates the camshaft lobes, distributor drive gear, cylinder walls, and piston pins.

The hydraulic valve tappets receive oil directly from the main oil gallery. Oil is provided to the camshaft bearing through galleries. The front camshaft bearing journal passes oil through the camshaft

DESCRIPTION AND OPERATION (Continued)

sprocket to the timing chain. Oil drains back to the oil pan under the number one main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets which pass oil through hollow push rods to a

hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components, then passes down through the push rod guide holes in the cylinder head past the valve tappet area, and returns to the oil pan.

DESCRIPTION AND OPERATION (Continued)

CYLINDER BLOCK

DESCRIPTION

The cylinder block is a cast iron inline six cylinder design. The cylinder block is drilled forming galleries for both oil and coolant (Fig. 3).

Fig. 3 4.0L Cylinder Block with Main Bearing Caps and Cap Brace

- 1 - BLOCK
- 2 - MAIN BEARING CAP BRACE

CYLINDER HEAD

DESCRIPTION

The cylinder head is made of cast iron containing twelve valves made of chrome plated heat resistant steel, valve stem seals, springs, retainers and keepers. The cylinder head and valve seats can be resurfaced for service purposes.

The valve guides are integral to the cylinder head. They are not replaceable. However, they are serviceable.

The cylinder head uses dual quench-type design combustion chambers which cause turbulence in the cylinders allowing faster burning of the air/fuel mixture, resulting in better fuel economy (Fig. 4).

Fig. 4 Cylinder Head 4.0L Engine

CRANKSHAFT

DESCRIPTION

The crankshaft is constructed of nodular cast iron. The crankshaft is a crossshaped four throw design with eight counterweights for balancing purposes. The crankshaft is supported by seven select main bearings with the number three serving as the thrust washer location. The main journals of the crankshaft are cross drilled to improve rod bearing lubrication. The select fit main bearing markings are located on the crankshaft counter weights. The crankshaft rear oil seal is a two piece design. The front oil seal is a one piece design retained in the timing chain cover (Fig. 5).

Fig. 5 Crankshaft with Select Fit Marking Location

- 1 - 1/4" LETTERS
- 2 - (ROD)
- 3 - (MAIN)

DESCRIPTION AND OPERATION (Continued)

PISTON AND CONNECTING ROD

DESCRIPTION

The pistons are made of a high strength aluminum alloy with an anodized top ring groove and crown. Piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The connecting rods are made of ductile iron. A pressed fit piston pin is used to attach the piston and connecting rod.

80bcea5c

Fig. 6 Piston and Connecting Rod Assembly

CAMSHAFT

DESCRIPTION

The camshaft is made of gray cast iron with twelve machined lobes and four bearing journals. When the camshaft rotates the lobes actuate the tappets and push rods, forcing upward on the rocker arms which applies downward force on the valves.

ROCKER ARM

DESCRIPTION

The rocker arms are made of stamped steel and have a operational ratio of 1.6:1. When the push rods are forced upward by the camshaft lobes the push rod presses upward on the rocker arms, the rocker arms pivot, forcing downward pressure on the valves forcing the valves to move downward and off from their seats (Fig. 8).

DESCRIPTION AND OPERATION (Continued)

VALVES

DESCRIPTION

The valves are made of heat resistant steel and have chrome plated stems to prevent scuffing. All valves use three bead locks to promote valve rotation (Fig. 9).

VALVE SPRING

DESCRIPTION

The valve springs are made of high strength silicon chrome spring steel. The springs are common for both intake and exhaust valves. (Fig. 9).

CYLINDER HEAD COVER

DESCRIPTION

The cylinder head cover (Fig. 10) is made of stamped steel and incorporates the Crankcase Ventilation (CCV) Hoses and the oil fill opening.

80bcea5b

Fig. 10 Cylinder Head Cover

HYDRAULIC TAPPET

DESCRIPTION

Valve lash is controlled by hydraulic tappets located inside the cylinder block, in tappet bores above the camshaft.

VALVE GUIDE

DESCRIPTION

The valve guides are integral to the cylinder head. They are not replaceable. However, they are serviceable.

OIL PAN

DESCRIPTION

The oil pan is made of stamped steel. The oil pan gasket is a one piece steel backbone silicone coated gasket.

VALVE STEM SEAL

DESCRIPTION

The valve stem seals are made of rubber and incorporate a garter spring to maintain consistent lubrication control (Fig. 9).

INTAKE MANIFOLD

DESCRIPTION

The intake manifold is made of cast aluminum and uses eleven bolts to mount to the cylinder head. This mounting style improves sealing and reduces the chance of leaks.

DESCRIPTION AND OPERATION (Continued)

**Fig. 11 Oil Pan**

- 1 - OIL PAN
2 - OIL PAN DRAIN PLUG

exhaust manifolds share a common gasket with the intake manifold. The exhaust manifolds also incorporate ball flange outlets for improved sealing and strain free connections.

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS—INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

Refer to the Service Diagnosis—Performance chart and the Service Diagnosis—Mechanical chart for possible causes and corrections of malfunctions. Refer to Group 14, Fuel System for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test.
- Cylinder Combustion Pressure Leakage Test.
- Engine Cylinder Head Gasket Failure Diagnosis.
- Intake Manifold Leakage Diagnosis.

**Fig. 12 Intake Manifold 4.0L Engine**

EXHAUST MANIFOLD

DESCRIPTION

The two exhaust manifolds are log style and are made of high silicon molybdenum cast iron. The

Refer to group 25, Emission Control System for correct operation 2. Repair or replace seal(s) 3. Hone cylinder bores. Install new rings 4. Hone cylinder bores and replace pistons as required 5. Remove rings and de-carbon piston 6. Inspect/replace valve guides as necessary 7. Remove rings and check ring end gap and side clearance. Replace if necessary

INTAKE MANIFOLD LEAKAGE DIAGNOSIS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

DIAGNOSIS AND TESTING (Continued)

- (1) Start the engine.
- (2) Spray a small stream of water at the suspected leak area.
- (3) If a change in RPM is observed the area of the suspected leak has been found.
- (4) Repair as required.

CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

- (1) Clean the spark plug recesses with compressed air.
- (2) Remove the spark plugs.
- (3) Secure the throttle in the wide-open position.
- (4) Disable the fuel system. (Refer to Group 14, Fuel System for the correct procedure)
- (5) Disconnect the ignition coil.
- (6) Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
- (7) Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

Refer to Engine Specifications for the correct engine compression pressures.

ENGINE CYLINDER HEAD GASKET FAILURE
DIAGNOSIS

A leaking engine cylinder head gasket usually results in loss of power, loss of coolant and engine misfiring.

An engine cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

- An engine cylinder head gasket leaking between adjacent cylinders is indicated by a loss of power and/or engine misfire.
- An engine cylinder head gasket leaking between a cylinder and an adjacent water jacket is indicated by coolant foaming or overheating and loss of coolant.

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders; follow the procedures outlined in Cylinder Compression Pressure Test. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50-70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

Remove the radiator cap.

Start the engine and allow it to warm up until the engine thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

If bubbles are not visible, install a radiator pressure tester and pressurize the coolant system.

If a cylinder is leaking combustion pressure into the water jacket, the tester pointer will pulsate with every combustion stroke of the cylinder.

CYLINDER COMBUSTION PRESSURE LEAKAGE
TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

(1) Check the coolant level and fill as required. DO NOT install the radiator cap.

(2) Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

(3) Remove the spark plugs.

(4) Remove the oil filler cap.

(5) Remove the air cleaner.

(6) Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.

(7) Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to the Cylinder Combustion Pressure Leakage Test Diagnosis chart.

DIAGNOSIS AND TESTING (Continued)

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

(1) Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.

(2) Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.

(3) Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.

(4) If dye is not observed, drive the vehicle at various speeds for approximately 24km (15 miles), and repeat inspection.

(4) **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method.

Air Leak Detection Test Method

(1) Disconnect the breather cap to air cleaner hose at the breather cap end. Cap or plug breather cap nipple.

(2) Remove the PCV valve from the cylinder head cover. Cap or plug the PCV valve grommet.

(3) Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

(4) Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.

(5) If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.

(6) If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and breather cap hose.

(7) Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

(1) Disconnect the battery.

(2) Raise the vehicle.

(3) Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:

(a) Circular spray pattern generally indicates seal leakage or crankshaft damage.

(b) Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil

DIAGNOSIS AND TESTING (Continued)

filter runoff, and main bearing cap to cylinder block mating surfaces.

(4) If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

CAUTION: Do not exceed 20.6 kPa (3 psi).

(5) If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

(6) For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

ENGINE OIL PRESSURE

(1) Disconnect connector and remove oil pressure sending unit.

(2) Install Oil Pressure Line and Gauge Tool C-3292 or equivalent. Start engine and record pressure. Refer to Oil Pressure in Engine Specifications for the correct pressures.

SERVICE PROCEDURES

VALVE TIMING

Disconnect the spark plug wires and remove the spark plugs.

Remove the engine cylinder head cover.

Remove the capscrews, bridge and pivot assembly, and rocker arms from above the No.1 cylinder.

Alternately loosen each capscrew, one turn at a time, to avoid damaging the bridge.

Rotate the crankshaft until the No.6 piston is at top dead center (TDC) on the compression stroke.

Rotate the crankshaft counterclockwise (viewed from the front of the engine) 90°.

Install a dial indicator on the end of the No.1 cylinder intake valve push rod. Use rubber tubing to secure the indicator stem on the push rod.

Set the dial indicator pointer at zero.

Rotate the crankshaft clockwise (viewed from the front of the engine) until the dial indicator pointer indicates 0.305 mm (0.012 inch) travel distance (lift).

The timing notch index on the vibration damper should be aligned with the TDC mark on the timing degree scale.

If the timing notch is more than 13 mm (1/2 inch) away from the TDC mark in either direction, the valve timing is incorrect.

If the valve timing is incorrect, the cause may be a broken camshaft pin. It is not necessary to replace the camshaft because of pin failure. A spring pin is available for service replacement.

VALVE SERVICE

Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

Clean all grime and gasket material from the engine cylinder head machined gasket surface.

Inspect for cracks in the combustion chambers and valve ports.

Inspect for cracks on the exhaust seat.

Inspect for cracks in the gasket surface at each coolant passage.

Inspect valves for burned, cracked or warped heads.

Inspect for scuffed or bent valve stems.

Replace valves displaying any damage.

VALVE REFACING

(1) Use a valve refacing machine to reface the intake and exhaust valves to the specified angle.

(2) After refacing, a margin of at least 0.787 mm (0.031 inch) must remain (Fig. 14). If the margin is less than 0.787 mm (0.031 inch), the valve must be replaced.

Fig. 14 Valve Facing Margin

- 1 - VALVE MARGIN
- 2 - NO MARGIN

SERVICE PROCEDURES (Continued)

VALVE SEAT REFACING

(1) Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.

(2) Use tapered stones to obtain the specified seat width when required.

(3) Control valve seat runout to a maximum of 0.0635 mm (0.0025 in.) (Fig. 15).

Fig. 15 Measurement of Valve Seat Runout

1 - DIAL INDICATOR

VALVE STEM OIL SEAL REPLACEMENT

Valve stem oil seals are installed on each valve stem to prevent rocker arm lubricating oil from entering the combustion chamber through the valve guide bores. One seal is marked INT (intake valve) and the other is marked EXH (exhaust valve).

Replace the oil seals whenever valve service is performed or if the seals have deteriorated.

VALVE GUIDES

The valve guides are an integral part of the engine cylinder head and are not replaceable.

When the valve stem guide clearance is excessive, the valve guide bores must be reamed oversize. Service valves with oversize stems are available in 0.076 mm (0.003 inch) and 0.381 mm (0.015 inch) increments.

Corresponding oversize valve stem seals are also available and must be used with valves having 0.381 mm (0.015 inch) oversize stems.

NOTE: If the valve guides are reamed oversize, the valve seats must be ground to ensure that the valve seat is concentric to the valve guide.

VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT

Valve stem-to-guide clearance may be measured by either of the following two methods.

PREFERRED METHOD

(1) Remove the valve from the head.

(2) Clean the valve stem guide bore with solvent and a bristle brush.

(3) Insert a telescoping gauge into the valve stem guide bore approximately 9.525 mm (.375 inch) from the valve spring side of the head (Fig. 16).

J9509-87

Fig. 16 Measurement of Valve Guide Bore Diameter

- 1 - GAUGE
- 2 - 9.525 MM (3/8 INCH)
- 3 - VALVE STEM GUIDE
- 4 - CYLINDER HEAD

(4) Remove and measure telescoping gauge with a micrometer.

(5) Repeat the measurement with contacts lengthwise to engine cylinder head.

(6) Compare the crosswise to lengthwise measurements to determine out-of-roundness. If the measurements differ by more than 0.0635 mm (0.0025 in.), ream the guide bore to accommodate an oversize valve stem.

(7) Compare the measured valve guide bore diameter with specifications (7.95-7.97 mm or 0.313-0.314 inch). If the measurement differs from specification by more than 0.076 mm (0.003 inch), ream the guide bore to accommodate an oversize valve stem.

SERVICE PROCEDURES (Continued)

ALTERNATIVE METHOD

(1) Use a dial indicator to measure the lateral movement of the valve stem (stem-to-guide clearance). This must be done with the valve installed in its guide and just off the valve seat (Fig. 17).

(2) Correct clearance is 0.025-0.0762 mm (0.001-0.003 inch). If indicated movement exceeds the specification ream the valve guide to accommodate an oversize valve stem.

NOTE: Valve seats must be ground after reaming the valve guides to ensure that the valve seat is concentric to the valve guide.

Fig. 17 Measurement of Lateral Movement of Valve Stem

1 - DIAL INDICATOR

VALVE SPRING TENSION TEST

Use a universal Valve Spring Tester and a torque wrench to test each valve spring for the specified tension value (Fig. 18).

Replace valve springs that are not within specifications.

PISTON FITTING

BORE GAGE METHOD

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

(2) Measure the inside diameter of the cylinder bore at a point 49.5 mm (1-15/16 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B (Fig. 20).

(3) The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. **The**

9509-79

Fig. 18 Valve Spring Tester

1 - TORQUE WRENCH

2 - VALVE SPRING TESTER

coated piston connecting rod assembly can be used to service previous built engines and MUST be replaced as complete sets. Tin coated pistons should not be used as replacements for coated pistons.

(4) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results (Fig. 19). Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.

(5) Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

PISTON RING—FITTING

(1) Carefully clean the carbon from all ring grooves. Oil drain openings in the oil ring groove and pin boss must be clear. **DO NOT** remove metal from the grooves or lands. This will change ring-to-groove clearances and will damage the ring-to-land seating.

(2) Be sure the piston ring grooves are free of nicks and burrs.

(3) Measure the ring side clearance with a feeler gauge fitted snugly between the ring land and ring (Fig. 21) (Fig. 22). Rotate the ring in the groove. It must move freely around circumference of the groove.

(4) Place ring in the cylinder bore and push down with inverted piston to position near lower end of the ring travel. Measure ring gap with a feeler gauge fitting snugly between ring ends (Fig. 23).

FITTING CONNECTING ROD BEARINGS**INSPECTION****BEARINGS**

Inspect the connecting rod bearings for scoring and bent alignment tabs (Fig. 29) (Fig. 30). Check the bearings for normal wear patterns, scoring, grooving, fatigue and pitting (Fig. 31). Replace any bearing that shows abnormal wear.

Inspect the connecting rod journals for signs of scoring, nicks and burrs.

CONNECTING RODS

Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod

SERVICE PROCEDURES (Continued)

Fig. 31 Scoring Caused by Insufficient Lubrication or by Damaged Crankshaft Pin Journal

alignment. Replace misaligned, bent or twisted connecting rods.

BEARING-TO-JOURNAL CLEARANCE

- (1) Wipe the oil from the connecting rod journal.
- (2) Use short rubber hose sections over rod bolts during installation.
- (3) Lubricate the upper bearing insert and install in connecting rod.
- (4) Use piston ring compressor to install the rod and piston assemblies. The oil squirt holes in the rods must face the camshaft. The arrow on the piston crown should point to the front of the engine (Fig. 32). Verify that the oil squirt holes in the rods face the camshaft and that the arrows on the pistons face the front of the engine.

Fig. 32 Rod and Piston Assembly Installation

- (5) Install the lower bearing insert in the bearing cap. The lower insert must be dry. Place strip of Plastigage across full width of the lower insert at the center of bearing cap. Plastigage must not crumble in use. If brittle, obtain fresh stock.

- (6) Install bearing cap and connecting rod on the journal and tighten nuts to 45 N·m (33 ft. lbs.) torque. DO NOT rotate crankshaft. Plastigage will smear, resulting in inaccurate indication.

- (7) Remove the bearing cap and determine amount of bearing-to-journal clearance by measuring the width of compressed Plastigage (Fig. 33). Refer to Engine Specifications for the proper clearance. **Plastigage should indicate the same clearance across the entire width of the insert. If the clearance varies, it may be caused by either a tapered journal, bent connecting rod or foreign material trapped between the insert and cap or rod.**

- (8) If the correct clearance is indicated, replacement of the bearing inserts is not necessary. Remove the Plastigage from crankshaft journal and bearing insert. Proceed with installation.

SERVICE PROCEDURES (Continued)

Fig. 33 Measuring Bearing Clearance with Plastigage

- 1 - PLASTIGAGE SCALE
2 - COMPRESSED PLASTIGAGE

(9) If bearing-to-journal clearance exceeds the specification, install a pair of 0.0254 mm (0.001 inch) undersize bearing inserts. All the odd size inserts must be on the bottom. The sizes of the service replacement bearing inserts are stamped on the backs of the inserts. Measure the clearance as described in the previous steps.

(10) The clearance is measured with a pair of 0.0254 mm (0.001 inch) undersize bearing inserts installed. This will determine if two 0.0254 mm (0.001 inch) undersize inserts or another combination is needed to provide the correct clearance (refer to Connecting Rod Bearing Fitting Chart).

CONNECTING ROD BEARING FITTING CHART

CRANKSHAFT JOURNAL		CORRESPONDING ROD BEARING INSERT	
Color Code	Diameter	Upper Insert Size	Lower Insert Size
Yellow	53.2257 - 53.2079 mm (2.0955 - 2.0948 in.)	Yellow - Standard	Yellow - Standard
Orange	53.2079 - 53.1901 mm (2.0948 - 2.0941 in.) 0.0178 mm (0.0007 in.) Undersize	Yellow - Standard	Blue - Undersize 0.025 mm (0.001 in.)
Blue	53.1901 - 53.1724 mm (2.0941 - 2.0934 in.) 0.0356 mm (0.0014 in.) Undersize	Blue - Undersize 0.025 mm (0.001 in.)	Blue - Undersize 0.025 mm (0.001 in.)
Red	52.9717 - 52.9539 mm (2.0855 - 2.0848 in.) 0.254 mm (0.010 in.) Undersize	Red - Undersize 0.254 mm (0.010 in.)	Red - Undersize 0.254 mm (0.010 in.)

(11) **FOR EXAMPLE:** If the initial clearance was 0.0762 mm (0.003 inch), 0.025 mm (0.001 inch) undersize inserts would reduce the clearance by 0.025 mm (0.001 inch). The clearance would be 0.051 mm (0.002 inch) and within specification. A 0.051 mm (0.002 inch) undersize insert would reduce the initial clearance an additional 0.013 mm (0.0005 inch). The clearance would then be 0.038 mm (0.0015 inch).

(12) Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

(13) Once you have selected the proper insert, install the insert and cap. Tighten the connecting rod bolts to 45 N·m (33 ft. lbs.) torque.

SIDE CLEARANCE MEASUREMENT

Slide snug-fitting feeler gauge between the connecting rod and crankshaft journal flange (Fig. 34). Refer to Engine Specifications for the proper clearance. Replace the connecting rod if the side clearance is not within specification.

SERVICE PROCEDURES (Continued)

Fig. 34 Checking Connecting Rod Side Clearance—Typical

FITTING CRANKSHAFT MAIN BEARINGS

INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated (Fig. 35). In general the lower bearing half will have a heavier wear pattern.

Fig. 35 Main Bearing Wear Patterns

- 1 - UPPER INSERT
- 2 - NO WEAR IN THIS AREA
- 3 - LOW AREA IN BEARING LINING
- 4 - LOWER INSERT

NOTE: If any of the crankshaft journals are scored, remove the engine for crankshaft repair.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

FITTING BEARINGS (CRANKSHAFT INSTALLED)

The main bearing caps, numbered (front to rear) from 1 through 7 have an arrow to indicate the forward position. The upper main bearing inserts are grooved to provide oil channels while the lower inserts are smooth.

Each bearing insert pair is selectively fitted to its respective journal to obtain the specified operating clearance. In production, the select fit is obtained by using various-sized color-coded bearing insert pairs as listed in the Main Bearing Fitting Chart. The bearing color code appears on the edge of the insert.

The size is not stamped on bearing inserts used for engine production.

The main bearing journal size (diameter) is identified by a color-coded paint mark (Fig. 36) on the adjacent cheek or counterweight towards the rear of the crankshaft (flange end). The rear main journal, is identified by a color-coded paint mark on the crankshaft rear flange.

When required, upper and lower bearing inserts of different sizes may be used as a pair. A standard size insert is sometimes used in combination with a 0.025 mm (0.001 inch) undersize insert to reduce the clearance by 0.013 mm (0.0005 inch). **Never use a pair of bearing inserts with greater than a 0.025 mm (0.001 inch) difference in size. Refer to the Bearing Insert Pair Chart.**

NOTE: When replacing inserts, the odd size inserts must be either all on the top (in cylinder block) or all on the bottom (in main bearing cap).

Once the bearings have been properly fitted, proceed to Crankshaft Main Bearing—Installation.

BEARING-TO-JOURNAL CLEARANCE (CRANKSHAFT INSTALLED)

When using Plastigage, check only one bearing clearance at a time.

Install the grooved main bearings into the cylinder block and the non-grooved bearings into the bearing caps.

Install the crankshaft into the upper bearings dry.

Place a strip of Plastigage across full width of the crankshaft journal to be checked.

Install the bearing cap and tighten the bolts to 108 N·m (80 ft. lbs.) torque.

NOTE: DO NOT rotate the crankshaft. This will cause the Plastigage to shift, resulting in an inaccurate reading. Plastigage must not be permitted to crumble. If brittle, obtain fresh stock.

Remove the bearing cap. Determine the amount of clearance by measuring the width of the compressed Plastigage with the scale on the Plastigage envelope

UPPER	STANDARD	STANDARD
LOWER	0.025 mm (0.001 in.) UNDERSIZE	0.051 mm (0.002 in.) UNDERSIZE

(Fig. 37). Refer to Engine Specifications for the proper clearance.

J9009-42

Fig. 37 Measuring Bearing Clearance with Plastigage

1 - PLASTIGAGE SCALE

2 - COMPRESSED PLASTIGAGE

Plastigage should indicate the same clearance across the entire width of the insert. If clearance varies, it may indicate a tapered journal or foreign material trapped behind the insert.

If the specified clearance is indicated and there are no abnormal wear patterns, replacement of the bearing inserts is not necessary. Remove the Plastigage from the crankshaft journal and bearing insert. Proceed to Crankshaft Main Bearing—Installation.

If the clearance exceeds specification, install a pair of 0.025 mm (0.001 inch) undersize bearing inserts and measure the clearance as described in the previous steps.

The clearance indicate with the 0.025 mm (0.001 inch) undersize insert pair installed will determine if this insert size or some other combination will provide the specified clearance. **FOR EXAMPLE:** If the clearance was 0.0762 mm (0.003 inch) originally, a pair of 0.0254 mm (0.001 inch) undersize inserts would reduce the clearance by 0.0254 mm (0.001 inch). The clearance would then be 0.0508 mm (0.002 inch) and within the specification. A 0.051 mm (0.002 inch) undersize bearing insert and a 0.0254 mm (0.001 inch) undersize insert would reduce the original clearance an additional 0.0127 mm (0.0005 inch). The clearance would then be 0.0381 mm (0.0015 inch).

CAUTION: Never use a pair of inserts that differ more than one bearing size as a pair.

FOR EXAMPLE: DO NOT use a standard size upper insert and a 0.051 mm (0.002 inch) undersize lower insert.

SERVICE PROCEDURES (Continued)

If the clearance exceeds specification using a pair of 0.051 mm (0.002 inch) undersize bearing inserts, measure crankshaft journal diameter with a micrometer. If the journal diameter is correct, the crankshaft bore in the cylinder block may be misaligned, which requires cylinder block replacement or machining to true bore.

Replace the crankshaft or grind to accept the appropriate undersize bearing inserts if:

- Journal diameters 1 through 6 are less than 63.4517 mm (2.4981 inches)
- Journal 7 diameter is less than 63.4365 mm (2.4975 inches).

Once the proper clearances have been obtained, proceed to Crankshaft Main Bearing—Installation.

**MAIN BEARING JOURNAL DIAMETER
(CRANKSHAFT REMOVED)**

Remove the crankshaft from the cylinder block (refer to Cylinder Block - Disassemble).

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper and out of round is 0.013 mm (0.0005 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

Install the crankshaft into the cylinder block (refer to Cylinder Block - Assemble and Crankshaft Main Bearings - Installation).

MAIN BEARING FITTING CHART

Crankshaft Journals #1-6		Corresponding Crankshaft Bearing Insert	
Color Code	Diameter	Upper Insert Size	Lower Insert Size
Yellow	63.5025 - 63.4898 mm (2.5001 - 2.4996 in.)	Yellow - Standard	Yellow - Standard

FORM-IN-PLACE GASKETS

There are several places where form-in-place gaskets are used on the engine. **DO NOT use form-in-place gasket material unless specified.** Care must be taken when applying form-in-place gaskets. Bead size, continuity and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over. A continuous bead of the proper width is essential to obtain a leak-free joint.

Two types of form-in-place gasket materials are used in the engine area (Mopar Silicone Rubber Adhesive Sealant and Mopar Gasket Maker). Each have different properties and cannot be used interchangeably.

MOPAR SILICONE RUBBER ADHESIVE SEALANT

Mopar Silicone Rubber Adhesive Sealant, normally black in color, is available in 3 ounce tubes. Moisture in the air causes the sealant material to cure. This material is normally used on flexible metal flanges. It has a shelf life of a year and will not properly cure if over aged. Always inspect the package for the expiration date before use.

MOPAR GASKET MAKER

Mopar Gasket Maker, normally red in color, is available in 6 cc tubes. This anaerobic type gasket

material cures in the absence of air when squeezed between smooth machined metallic surfaces. It will not cure if left in the uncovered tube. **DO NOT** use on flexible metal flanges.

SURFACE PREPARATION

Parts assembled with form-in-place gaskets may be disassembled without unusual effort. In some instances, it may be necessary to lightly tap the part with a mallet or other suitable tool to break the seal between the mating surfaces. A flat gasket scraper may also be lightly tapped into the joint but care must be taken not to damage the mating surfaces.

Scrape or wire brush all gasket surfaces to remove all loose material. Inspect stamped parts to ensure gasket rails are flat. Flatten rails with a hammer on a flat plate, if required. Gasket surfaces must be free of oil and dirt. Make sure the old gasket material is removed from blind attaching holes.

GASKET APPLICATION

Assembling parts using a form-in-place gasket requires care.

Mopar Silicone Rubber Adhesive Sealant should be applied in a continuous bead approximately 3 mm (0.12 inch) in diameter. All mounting holes must be circled. For corner sealing, a 3 or 6 mm (1/8 or 1/4 inch) drop is placed in the center of the gasket con-

SERVICE PROCEDURES (Continued)

tact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The use of a locating dowel is recommended during assembly to prevent smearing the material off location.

Mopar Gasket Maker should be applied sparingly to one gasket surface. The sealant diameter should be 1.00 mm (0.04 inch) or less. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing the material off location.

ENGINE PERFORMANCE

It is important that the vehicle is operating to its optimum performance level to maintain fuel economy and the lowest emission levels. If vehicle is not operating to these standards, refer to Engine Diagnosis outlined in this section. The following procedures can assist in achieving the proper engine diagnosis.

- (1) Test cranking amperage draw. Refer to Electrical Group 8B, Cold Cranking Test.
- (2) Check intake manifold bolt torque; Refer to Group 11, Exhaust System and Intake Manifold.
- (3) Perform cylinder compression test. Refer to Cylinder Compression Pressure Test in the Engine Diagnosis area of this section.
- (4) Clean or replace spark plugs as necessary and adjust gap as specified in Electrical Group 8D. Tighten to specifications.
- (5) Test resistance of spark plug cables. Refer to Electrical Group 8D, Spark Plug Cables.
- (6) Inspect the primary wires. Test coil output voltage and primary resistance. Replace parts as necessary. Refer to Electrical Group 8D, for specifications.
- (7) Test fuel pump for pressure. Refer to Group 14, Fuel System Specifications.
- (8) The air filter elements should be replaced as specified in Lubrication and Maintenance, Group 0.
- (9) Inspect crankcase ventilation system as outlined in Group 0, Lubrication and Maintenance. For emission controls see Group 25, Emission Controls for service procedures.
- (10) Road test vehicle as a final test.

HONING CYLINDER BORES

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

(1) Used carefully, the Cylinder Bore Sizing Hone C-823 equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round as well as removing light

scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

(2) Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use a cylinder surfacing hone, Honing Tool C-3501, equipped with 280 grit stones (C-3501-3810). 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Using honing oil C-3501-3880 or a light honing oil available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits or kerosene.

(3) Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings (Fig. 38).

Fig. 38 Cylinder Bore Crosshatch Pattern

- 1 - CROSSHATCH PATTERN
2 - INTERSECT ANGLE

(4) A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle. The number of up and down strokes per minute can be regulated to get the desired 50° to 60° angle. Faster up and down strokes increase the crosshatch angle.

(5) After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

SERVICE PROCEDURES (Continued)

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

SERVICE ENGINE ASSEMBLY (SHORT BLOCK)

A service replacement engine assembly (short block) may be installed whenever the original cylinder block is defective or damaged beyond repair. It consists of the cylinder block, crankshaft, piston and rod assemblies. If needed, the camshaft must be procured separately and installed before the engine is installed in the vehicle.

A short block is identified with the letter "S" stamped on the same machined surface where the build date code is stamped for complete engine assemblies.

Installation includes the transfer of components from the defective or damaged original engine. Follow the appropriate procedures for cleaning, inspection and torque tightening.

HYDROSTATIC LOCK

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

- (1) Perform the Fuel Pressure Release Procedure (refer to Group 14, Fuel System).
- (2) Disconnect the negative cable from the battery.
- (3) Inspect air cleaner, induction system and intake manifold to ensure system is dry and clear of foreign material.
- (4) Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the plugs from the engine.

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

- (5) With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.
- (6) Identify the fluid in the cylinders (i.e. coolant, fuel, oil, etc.).
- (7) Make sure all fluid has been removed from the cylinders.
- (8) Repair engine or components as necessary to prevent this problem from occurring again.

(9) Squirt engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.

(10) Install new spark plugs. Tighten the spark plugs to 37 N·m (27 ft. lbs.) torque.

(11) Drain engine oil. Remove and discard the oil filter.

(12) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(13) Install a new oil filter.

(14) Fill engine crankcase with the specified amount and grade of oil (refer to Group 0, Lubrication and Maintenance).

(15) Connect the negative cable to the battery.

(16) Start the engine and check for any leaks.

ENGINE OIL SERVICE

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY.

ENGINE OIL SPECIFICATION

CAUTION: Do not use non-detergent or straight mineral oil when adding or changing crankcase lubricant. Engine failure can result.

API SERVICE GRADE CERTIFIED

Use an engine oil that is API Service Grade Certified. MOPAR provides engine oils that conform to the latest recommended service grades.

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans (Fig. 39).

Fig. 39 Engine Oil Container Standard Notations

SERVICE PROCEDURES (Continued)

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. SAE 10W-30 specifies a multiple viscosity engine oil. Engine oils also have multiple viscosities. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation (Fig. 40).

Fig. 40 Temperature/Engine Oil Viscosity

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

The engine oil level indicator (Dipstick) is located at the right rear of the 4.0L engine. Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick (Fig. 41).

- (1) Position vehicle on level surface.
- (2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
- (3) Wipe dipstick clean.
- (4) Install dipstick and verify it is seated in the tube.
- (5) Remove dipstick, with handle held above the tip, take oil level reading (Fig. 41).
- (6) Add oil only if level is below the ADD mark on dipstick.

Fig. 41 Engine Oil Dipstick—4.0L Engine

- 1 - DIPSTICK
- 2 - ADD
- 3 - SAFE

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules.

Run engine until achieving normal operating temperature.

- (1) Position the vehicle on a level surface and turn engine off.
- (2) Hoist and support vehicle on safety stands.
- (3) Remove oil fill cap.
- (4) Place a suitable drain pan under crankcase drain.
- (5) Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
- (6) Install drain plug in crankcase.
- (7) Lower vehicle and fill crankcase with specified type and amount of engine oil described in this section.
- (8) Install oil fill cap.
- (9) Start engine and inspect for leaks.
- (10) Stop engine and inspect oil level.

ENGINE OIL FILTER CHANGE

FILTER SPECIFICATION

CAUTION: Do not use oil filter with metric threads. The proper oil filter has SAE type 3/4 X 16 threads. An oil filter with metric threads can result in oil leaks and engine failure.

All Jeep engines are equipped with a high quality full-flow, throw-away type oil filter. DaimlerChrysler

SERVICE PROCEDURES (Continued)

Corporation recommends a Mopar or equivalent oil filter be used.

OIL FILTER REMOVAL

- (1) Position a drain pan under the oil filter.
- (2) Using a suitable oil filter wrench loosen filter.
- (3) Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss or filter adapter housing (Fig. 42).

Fig. 42 Oil Filter—4.0L Engine

- 1 - CYLINDER BLOCK
- 2 - ADAPTER
- 3 - OIL FILTER

(4) When filter separates from adapter nipple, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

(5) Make sure old gasket comes off with oil filter. With a wiping cloth, clean the gasket sealing surface (Fig. 43) of oil and grime.

OIL FILTER INSTALLATION

- (1) Lightly lubricate oil filter gasket with engine oil or chassis grease.
- (2) Thread filter onto adapter nipple. When gasket makes contact with sealing surface, (Fig. 43) hand tighten filter one full turn, do not over tighten.
- (3) Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this section.

Fig. 43 Oil Filter Sealing Surface—Typical

- 1 - SEALING SURFACE
- 2 - RUBBER GASKET
- 3 - OIL FILTER

REMOVAL AND INSTALLATION

ENGINE MOUNTS—FRONT

The front mounts support the engine at each side. These supports are made of resilient rubber.

REMOVAL

- (1) Disconnect negative cable from battery.
 - (2) Raise the vehicle.
 - (3) Support the engine.
 - (4) Remove the nut from the through bolt (Fig. 44).
- DO NOT remove the through bolt.
- (5) Remove the retaining bolts and nuts from the support cushions (Fig. 44).
 - (6) Remove the through bolt.
 - (7) Remove the support cushions.

INSTALLATION

(1) If the engine support bracket was removed, position the bracket onto the block and install the attaching bolts (Fig. 44). Tighten the engine support bracket bolts to 61 N·m (45 ft. lbs.) torque.

(2) If the support cushion bracket was removed, position the bracket onto the lower front sill (Fig. 45). Install support cushion bracket bolts and nuts. Tighten the bolts to 54 N·m (40 ft. lbs.) torque. Tighten the nuts to 41 N·m (30 ft. lbs.) torque.

(3) Place the support cushion into position on the support cushion bracket (Fig. 44). Install and tighten the bolts and nuts to 41 N·m (30 ft. lbs.) torque.

(4) Install the through bolt and the retaining nut (Fig. 44). Tighten the through bolt nut to 65 N·m (48 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

Fig. 44 Front Mounts

- 7 - SUPPORT CUSHION BRACKET
- 8 - SUPPORT CUSHION

- (5) Remove the engine support.
- (6) Lower the vehicle.
- (7) Connect negative cable to battery.

ENGINE MOUNT—REAR

A resilient rubber cushion supports the transmission at the rear between the transmission extension housing and the rear support crossmember or skid plate.

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Raise the vehicle and support the transmission.
- (3) Remove the nuts holding the support cushion to the crossmember (Fig. 46) (Fig. 47). Remove the crossmember.

Fig. 45 Support Cushion Bracket

- 1 - SUPPORT CUSHION BRACKET
- 2 - SUPPORT CUSHION BRACKET

MANUAL TRANSMISSION

(Fig. 46)

- a. Remove the support cushion nuts and remove the cushion.
- b. Remove the transmission support bracket bolts and remove the bracket from the transmission.

AUTOMATIC TRANSMISSION

(Fig. 47)

- a. Remove the support cushion bolts and remove the cushion and the support bracket from the transmission (4WD) or from the adaptor bracket (2WD).
- b. On 2WD vehicles, remove the bolts holding the transmission support adaptor bracket to the transmission (Fig. 47). Remove the adaptor bracket.

INSTALLATION

MANUAL TRANSMISSION:

- a. Install the transmission support bracket to the transmission. Install the bolts and tighten to 46 N·m (34 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

J9409-48

Fig. 46 Rear Mount(Manual Transmission)

- 1 - TRANSMISSION SUPPORT BRACKET
- 2 - SUPPORT CUSHION
- 3 - CROSSMEMBER ASSEMBLY

b. Install the support cushion to the support bracket. Install the nuts and tighten to 75 N·m (55 ft. lbs.) torque.

AUTOMATIC TRANSMISSION:

a. On 2WD vehicles, position the transmission support adaptor bracket to the transmission. Install the bolts and tighten to 75 N·m (55 ft. lbs.) torque.

b. Position the transmission support bracket and support cushion to the adaptor bracket (2WD) or the transmission (4WD). Install the bolts and tighten to 75 N·m (55 ft. lbs.) torque.

(1) Position the crossmember onto the support cushion studs. Install the stud nuts and tighten to 22 N·m (192 in. lbs) torque.

(2) Install crossmember-to-sill bolts and tighten to 41 N·m (30 ft. lbs.) torque.

(3) Remove the transmission support.

(4) Lower the vehicle.

(5) Connect negative cable to battery.

ENGINE ASSEMBLY**REMOVAL**

(1) Disconnect the battery cables. Remove the battery.

(2) Mark the hinge locations on the hood panel for alignment reference during installation. Remove the engine compartment lamp. Remove the hood.

J9409-45

WARNING: THE COOLANT IN A RECENTLY OPERATED ENGINE IS HOT AND PRESSURIZED. USE CARE TO PREVENT SCALDING BY HOT COOLANT. CAREFULLY RELEASE THE PRESSURE BEFORE REMOVING THE RADIATOR DRAIN COCK AND CAP.

(3) Remove the air cleaner assembly.

(4) Loosen the radiator drain cock and radiator cap to drain the coolant. DO NOT waste usable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

(5) Remove the lower radiator hose.

(6) Remove the upper radiator hose and coolant recovery hose (Fig. 48).

(7) Remove upper radiator support retaining bolts and remove radiator support.

(8) Remove the fan shroud (Fig. 48) and electric cooling fan.

(9) Disconnect the transmission fluid cooler tubing (automatic transmission).

REMOVAL AND INSTALLATION (Continued)

(10) Disconnect radiator fan switch wire connector.

(11) **Vehicles with Air Conditioning:**

(a) Discharge A/C system (refer to group 24, Heating and Air Conditioning for proper procedures)

(b) Disconnect the suction/discharge hose and cap off compressor ports to prevent foreign material and refrigerant oil loss.

(12) Remove the radiator or radiator and condenser (if equipped with A/C).

(13) Remove the fan assembly from the idler pulley.

(14) Disconnect the heater hoses at the engine thermostat housing and water pump (Fig. 48) (Fig. 49).

Fig. 48 Upper Radiator Hose, Coolant Recovery Hose, Fan Shroud & Heater hoses

- 1 - UPPER RADIATOR HOSE
- 2 - HEATER HOSES
- 3 - FAN SHROUDS
- 4 - COOLANT RECOVERY HOSE

(15) Disconnect the throttle cable.

(16) Disconnect the speed control cable (if equipped).

(17) Disconnect the line pressure cable (if equipped with automatic transmission).

(18) Disconnect the fuel injector harness at the injectors.

(19) Disconnect the distributor electrical connection and the oil pressure switch connector.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE TURNED OFF). BEFORE DISCONNECTING FUEL LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED.

(20) Perform the Fuel System Pressure Release procedure (refer to Group 14, Fuel System).

Fig. 49 Heater Hoses (RH Drive Vehicle)

- 1 - HEATER HOSES

(21) Remove the latch clip and disconnect fuel supply line.

(22) Remove the power brake vacuum check valve from the booster, if equipped.

(23) If equipped with power steering :

(a) Disconnect the hoses from the fittings at the steering gear.

(b) Drain the pump reservoir.

(c) Cap the fittings on the hoses and steering gear to prevent foreign objects from entering the system.

(24) Identify, tag and disconnect all necessary wire connectors and vacuum hoses.

(25) Raise and support the vehicle.

(26) Disconnect the wires from the starter motor solenoid.

(27) Remove the starter motor.

(28) Disconnect the exhaust pipe from the manifold.

(29) Disconnect the engine speed sensor wire connection.

(30) Remove the exhaust pipe support.

(31) Remove the flywheel and converter housing access cover.

(32) **Vehicles with Automatic Transmission:**

(a) Mark the converter and drive plate location.

(b) Remove the converter-to-drive plate bolts.

(33) Remove the upper flywheel and converter housing bolts and loosen the bottom bolts.

(34) Remove the engine mount cushion-to-engine compartment bracket bolts.

(35) Lower the vehicle.

(36) Attach a lifting device to the engine.

(37) Raise the engine off the front supports.

(38) Place a support or floor jack under the converter (or flywheel) housing.

REMOVAL AND INSTALLATION (Continued)

(39) Remove the remaining converter (or flywheel) housing bolts.

(40) Lift the engine out of the engine compartment.

INSTALLATION

CAUTION: When installing the engine into a vehicle equipped with an automatic transmission, be careful not to damage the trigger wheel on the flywheel.

(1) Attach a lifting device to the engine and lower the engine into the engine compartment. For easier installation, it may be necessary to remove the engine mount cushions from the engine mount bracket as an aide in alignment of the engine to the transmission.

(2) **Vehicles with Manual Transmission:**

(a) Insert the transmission shaft into the clutch spline.

(b) Align the flywheel housing with the engine.

(c) Install and tighten the flywheel housing lower bolts finger tight.

(3) **Vehicles with Automatic Transmission:**

(a) Align the transmission torque converter housing with the engine.

(b) Loosely install the converter housing lower bolts and install the next higher bolt and nut on each side.

(c) Tighten all 4 bolts finger tight.

(4) Install the engine mount cushions (if removed).

(5) Lower the engine and engine mount cushions onto the engine compartment brackets. Install the bolts and finger tighten the nuts.

(6) Remove the engine lifting device.

(7) Raise and support the vehicle.

(8) Install the remaining flywheel and converter housing bolts. Tighten all bolts to 38 N·m (28 ft. lbs.) torque.

(9) **Vehicles with Automatic Transmission:**

(a) Install the converter-to-drive plate bolts.

(b) Ensure the installation reference marks are aligned.

(10) Install the flywheel and converter housing access cover.

(11) Install the exhaust pipe support and tighten the screw.

(12) Tighten the engine mount-to-bracket bolts.

(13) Connect the engine speed sensor wire connections and tighten the screws.

(14) Connect the exhaust pipe to the manifold.

(15) Install the starter motor and connect the cable.

(16) Connect the wires to the starter motor solenoid.

(17) Lower the vehicle.

(18) Connect all the vacuum hoses and wire connectors identified during engine removal.

(19) **Vehicles with Power Steering:**

(a) Remove the protective caps

(b) Connect the hoses to the fittings at the steering gear. Tighten the nut to 52 N·m (38 ft. lbs.) torque.

(c) Fill the pump reservoir with fluid.

(20) Install the power brake vacuum check valve to the booster, if equipped.

(21) Connect the fuel supply hose the fuel rail. Push until a "click" is heard. Install latch clip

(22) Connect the fuel injector harness to the injectors.

(23) Connect the distributor electrical connector and oil pressure switch connector.

(24) Connect the line pressure cable (if equipped with automatic transmission).

(25) Connect the speed control cable, if equipped.

(26) Connect the throttle cable.

(27) Connect the heater hoses at the engine thermostat housing and water pump.

(28) Install the fan assembly to the idler pulley.

(29) Connect the suction/discharge hose to the compressor.

(30) Connect automatic transmission fluid cooler lines, if equipped.

(31) Install the fan shroud, electric cooling fan and radiator and condenser (if equipped with A/C).

(32) Connect the electric fan connector.

(33) Install upper radiator support.

(34) Connect the upper radiator hose.

(35) Connect the lower radiator hose.

(36) Align the hood to the scribe marks. Install the hood.

(37) Install the air cleaner assembly.

(38) Install the battery and connect the battery cable.

(39) Add the proper amount of engine oil and coolant.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(40) Start the engine, inspect for leaks and correct the fluid levels, as necessary.

(41) Charge the air conditioning system (refer to Group 24, Heating and Air Conditioning for proper procedures).

REMOVAL AND INSTALLATION (Continued)

INTAKE AND EXHAUST MANIFOLD

REMOVAL

NOTE: THE ENGINE INTAKE AND EXHAUST MANIFOLD MUST BE REMOVED AND INSTALLED TOGETHER. THE MANIFOLDS USE A COMMON GASKET AT THE CYLINDER HEAD.

- (1) Disconnect the battery negative cable.
- (2) Remove air cleaner inlet hose from the resonator assembly.
- (3) Remove the air cleaner assembly.
- (4) Remove the throttle cable, vehicle speed control cable (if equipped) and the transmission line pressure cable.
- (5) Disconnect the following electrical connections and secure their harness out of the way:
 - Throttle Position Sensor
 - Idle Air Control Motor
 - Coolant Temperature Sensor (at thermostat housing)
 - Intake Air Temperature Sensor
 - Oxygen Sensor
 - Crank Position Sensor
 - Six (6) Fuel Injector Connectors
 - Manifold Absolute Pressure (MAP) Sensor.
- (6) Disconnect HVAC, and Brake Booster vacuum supply hoses at the intake manifold.
- (7) Perform the fuel pressure release procedure. (Refer to Group 14, Fuel Systems for correct procedure)
- (8) Disconnect and remove the fuel system supply line from the fuel rail assembly. (Refer to Group 14, Quick Connect Fittings for correct procedures)
- (9) Remove the accessory drive belt (refer to Group 7, Cooling System). Loosen the tensioner.
- (10) Remove the power steering pump from the intake manifold and set aside.
- (11) Raise the vehicle.
- (12) Disconnect the exhaust pipes from the engine exhaust manifolds.
- (13) Lower the vehicle.
- (14) Remove the intake manifold and engine exhaust manifolds.

INSTALLATION

If the manifold is being replaced, ensure all the fitting, etc. are transferred to the replacement manifold.

- (1) Install a new engine exhaust/intake manifold gasket over the alignment dowels on the cylinder head.
- (2) Position the engine exhaust manifolds to the cylinder head. Install fastener Number 3 and finger tighten at this time (Fig. 50).

(3) Install intake manifold on the cylinder head dowels.

(4) Install washer and fastener Numbers 1, 2, 4, 5, 8, 9, 10 and 11 (Fig. 50).

(5) Install washer and fastener Numbers 6 and 7 (Fig. 50).

(6) Tighten the fasteners in sequence and to the specified torque (Fig. 50).

• Fastener Numbers 1 through 5—Tighten to 33 N·m (24 ft. lbs.) torque.

• Fastener Numbers 6 and 7—Tighten to 31 N·m (23 ft. lbs.) torque.

• Fastener Numbers 8 through 11—Tighten to 33 N·m (24 ft. lbs.) torque.

Fig. 50 Intake and Exhaust Manifolds—4.0L

(7) Install the power steering pump to the intake manifold.

(8) Install the accessory drive belt. (Refer to Group 7, Cooling System for the correct procedures)

(9) Install the fuel system supply line to the fuel rail assembly. **Before connecting the fuel supply line to the fuel rail inspect the O-rings and replace if necessary. Refer to Group 14, Fuel System for the correct procedure.**

(10) Connect all electrical connections on the intake manifold.

(11) Connect the vacuum hoses previously removed.

(12) Install throttle cable, vehicle speed control cable (if equipped).

(13) Install the transmission line pressure cable (if equipped). Refer to Group 21, Transmission for the adjustment procedures.

(14) Install air cleaner assembly.

(15) Connect air inlet hose to the resonator assembly.

(16) Raise the vehicle.

(17) Connect the exhaust pipes to the engine exhaust manifolds. Tighten the bolts to 31 N·m (23 ft. lbs.)

REMOVAL AND INSTALLATION (Continued)

- (18) Lower the vehicle.
- (19) Connect the battery negative cable.
- (20) Start the engine and check for leaks.

EXHAUST MANIFOLD—4.0L ENGINE

The intake and engine exhaust manifolds on the 4.0L engine must be removed and installed together. The manifolds use a common gasket at the cylinder head.

Refer to Intake Manifold—4.0L Engine in this section for the proper removal and installation procedures.

CYLINDER HEAD COVER

The cylinder head cover is isolated from the cylinder head via grommets and a reusable molded rubber gasket. The grommet and limiter are retained in the cylinder head cover.

There are two cylinder head bolts that have a pin to locate the cylinder head cover gasket, they are located at position 8 and 9 (Fig. 52)

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Disconnect the Crankcase Ventilation (CCV) vacuum hose from engine cylinder head cover.
- (3) Disconnect the fresh air inlet hose from the engine cylinder head cover.
- (4) Disconnect the accelerator, transmission, and speed (if equipped) control cables from the throttle body (Fig. 51).
- (5) Remove the three bolts that fasten the control cable bracket to the intake manifold.
- (6) Remove control cables from cylinder head cover clip.
- (7) Position control cables and bracket away from cylinder head cover secure with tie straps.
- (8) Remove the engine cylinder head cover mounting bolts.
- (9) Remove the engine cylinder head cover and gasket.

INSTALLATION

- (1) If a replacement cover is installed, transfer the CCV valve grommet and oil filler cap from the original cover to the replacement cover.
- (2) Install cylinder head cover and gasket. Tighten the mounting bolts to 10 N·m (85 in. lbs.) torque.
- (3) Connect the CCV hoses.
- (4) Install control cables and bracket on intake manifold and tighten bolts to 8.7 N·m (77 in. lbs.) torque.
- (5) Connect control cables to throttle body linkage.
- (6) Snap control cables into cylinder head cover clip.
- (7) Connect negative cable to battery.

80a7e396

Fig. 51 Engine Cylinder Head Cover

- 1 - TRANS CONTROL CABLE
- 2 - ACCELERATOR CABLE
- 3 - CONTROL CABLE BRACKET
- 4 - CYLINDER HEAD COVER

J9209-38

Fig. 52 Cylinder Head Cover Gasket Locator Pins at #8 & #9

ROCKER ARMS AND PUSH RODS

This procedure can be done with the engine in or out of the vehicle.

REMOVAL

- (1) Remove the engine cylinder head cover.
- (2) Check for rocker arm bridges which are causing misalignment of the rocker arm to valve tip area.
- (3) Remove the capscrews at each bridge and pivot assembly (Fig. 53). Alternately loosen the capscrews one turn at a time to avoid damaging the bridges.
- (4) Remove the bridges, pivots and corresponding pairs of rocker arms (Fig. 53). Place them on a bench in the same order as removed.
- (5) Remove the push rods and place them on a bench in the same order as removed.

INSTALLATION

- (1) Lubricate the ball ends of the push rods with Mopar Engine Oil Supplement, or equivalent and install push rods in their original locations. Ensure

REMOVAL AND INSTALLATION (Continued)

J8909-8

Fig. 53 Rocker Arm Assembly

- 1 - CAPSCREWS
- 2 - BRIDGE
- 3 - PIVOT ASSEMBLY
- 4 - PUSH RODS
- 5 - ROCKER ARMS

that the bottom end of each push rod is centered in the tappet plunger cap seat.

(2) Using Mopar Engine Oil Supplement, or equivalent, lubricate the area of the rocker arm that the pivot contacts. Install rocker arms, pivots and bridge above each cylinder in their originally position.

(3) Loosely install the capscrews through each bridge.

(4) At each bridge, tighten the capscrews alternately, one turn at a time, to avoid damaging the bridge. Tighten the capscrews to 28 N·m (21 ft. lbs.) torque.

(5) Install the engine cylinder head cover.

VALVE SPRINGS AND OIL SEALS

This procedure can be done with the engine cylinder head installed on the block.

REMOVAL

Inspect the valve stems, especially the grooves. An Arkansas smooth stone should be used to remove nicks and high spots.

Each valve spring is held in place by a retainer and a set of conical valve locks. The locks can be removed only by compressing the valve spring.

(1) Remove the engine cylinder head cover.

(2) Remove cap screws, bridge and pivot assemblies and rocker arms for access to each valve spring to be removed.

(3) Remove push rods. **Retain the push rods, bridges, pivots and rocker arms in the same order and position as removed.**

(4) Inspect the springs and retainer for cracks and possible signs of weakening.

(5) Remove the spark plug(s) adjacent to the cylinder(s) below the valve springs to be removed.

(6) Connect an air hose to the adapter and apply air pressure slowly. Maintain at least 621 kPa (90 psi) of air pressure in the cylinder to hold the valves against their seats. For vehicles equipped with an air conditioner, use a flexible air adaptor when servicing the No.1 cylinder.

(7) Tap the retainer or tip with a rawhide hammer to loosen the lock from the retainer. Use Valve Spring Compressor Tool MD-998772A to compress the spring and remove the locks (Fig. 54).

(8) Remove valve spring and retainer (Fig. 54).

(9) Remove valve stem oil seals (Fig. 54). Note the valve seals are different for intake and exhaust valves. The top of each seal is marked either INT (intake/black in color) or EXH (exhaust/brown in color). DO NOT mix the seals.

80b7704b

Fig. 54 Valve and Valve Components

- 1 - VALVE LOCKS (3-BEAD)
- 2 - RETAINER
- 3 - VALVE STEM OIL SEAL
- 4 - INTAKE VALVE
- 5 - EXHAUST VALVE
- 6 - VALVE SPRING

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

CAUTION: Install oil seals carefully to prevent damage from the sharp edges of the valve spring lock grove.

(1) Lightly push the valve seal over the valve stem and valve guide boss. Be sure the seal is completely seated on the valve guide boss.

(2) Install valve spring and retainer.

(3) Compress the valve spring with Valve Spring Compressor Tool MD-998772A and insert the valve locks. Release the spring tension and remove the tool. Tap the spring from side-to-side to ensure that the spring is seated properly on the engine cylinder head.

(4) Release air pressure and disconnect the air hose. Remove the adaptor from the spark plug hole and install the spark plug.

(5) Repeat the procedures for each remaining valve spring to be removed.

(6) Install the push rods. Ensure the bottom end of each rod is centered in the plunger cap seat of the hydraulic valve tappet.

(7) Install the rocker arms, pivots and bridge at their original location.

(8) Tighten the bridge cap screws alternately, one at a time, to avoid damaging the bridge. Tighten the cap screws to 28 N·m (21 ft. lbs.) torque.

(9) Install the engine cylinder head cover.

CYLINDER HEAD

This procedure can be done with the engine in or out of the vehicle.

REMOVAL

(1) Disconnect the battery negative cable.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAIN COCK WITH THE SYSTEM HOT AND PRESSURIZED BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

(2) Drain the coolant and disconnect the hoses at the engine thermostat housing and the water pump inlet. DO NOT waste reusable coolant. If the solution is clean and is being drained only to service the engine or cooling system, drain the coolant into a clean container for reuse.

(3) Remove the air cleaner assembly.

(4) Remove the engine cylinder head cover.

(5) Remove the capscrews, bridge and pivot assemblies and rocker arms.

(6) Remove the push rods. **Retain the push rods, bridges, pivots and rocker arms in the same order as removed.**

(7) Loosen the accessory drive belt at the power steering pump. (Refer to Group 7, Cooling System for the correct procedure). Slip the belt off of the power steering pulley.

(8) Remove the A/C compressor mounting bolts and secure the compressor to the side.

(9) Remove the power steering pump and bracket from the intake manifold and water pump. Set the pump and bracket aside. DO NOT disconnect the hoses.

(10) Perform the Fuel System Pressure Release procedure. (Refer to Group 14, Fuel System)

(11) Disconnect the fuel supply line at the fuel rail. (Refer to Group 14, Quick-Connect Fittings for the correct procedures)

(12) Remove the intake and engine exhaust manifolds from the engine cylinder head. (Refer to Group 11, Exhaust System and Intake Manifold for the proper procedures)

(13) Disconnect the coil rail electrical connectors and remove the coil rail.

(14) Remove spark plugs.

(15) Disconnect the temperature sending unit wire connector.

(16) Remove the engine cylinder head bolts. Bolt No.14 cannot be removed until the head is moved forward (Fig. 55). Pull bolt No.14 out as far as it will go and then suspend the bolt in this position (tape around the bolt).

(17) Remove the engine cylinder head and gasket (Fig. 55).

(18) If this was the first time the bolts were removed, put a paint dab on the top of the bolt. If the bolts have a paint dab on the top of the bolt or it isn't known if they were used before, discard the bolts.

(19) Stuff clean lint free shop towels into the cylinder bores.

NOTE: If the valves, springs, or seals are to be inspected/replaced at this time, refer to Valves and Valve Springs in this section for proper inspection procedures.

INSTALLATION

The engine cylinder head gasket is a composition gasket. The gasket is to be installed DRY. **DO NOT use a gasket sealing compound on the gasket.**

If the engine cylinder head is to be replaced and the original valves used, measure the valve stem diameter. Only standard size valves can be used with a service replacement engine cylinder head unless the replacement head valve stem guide bores are reamed to accommodate oversize valve stems. Remove all carbon buildup and reface the valves.

REMOVAL AND INSTALLATION (Continued)

80a534a1

Fig. 55 Engine Cylinder Head Assembly

- 1 - CYLINDER HEAD BOLTS
- 2 - CYLINDER HEAD GASKET
- 3 - CYLINDER HEAD

(1) Remove the shop towels from the cylinder bores. Coat the bores with clean engine oil.

(2) Position the engine cylinder head gasket (with the numbers facing up) using the alignment dowels in the cylinder block, to position the gasket.

CAUTION: Engine cylinder head bolts should be reused only once. Replace the head bolts if they were used before or if they have a paint dab on the top of the bolt.

(3) With bolt No.14 held in place (tape around bolt), install the engine cylinder head over the same dowels used to locate the gasket. Remove the tape from bolt No.14.

(4) Coat the threads of stud bolt No.11 with Loc-tite 592 sealant, or equivalent.

(5) Tighten the engine cylinder head bolts in sequence according to the following procedure (Fig. 56).

CAUTION: During the final tightening sequence, bolt No.11 will be tightened to a lower torque than the rest of the bolts. **DO NOT** overtighten bolt No.11.

- (a) Tighten all bolts in sequence (1 through 14) to 30 N·m (22 ft. lbs.) torque.
- (b) Tighten all bolts in sequence (1 through 14) to 61 N·m (45 ft. lbs.) torque.
- (c) Check all bolts to verify they are set to 61 N·m (45 ft. lbs.) torque.
- (d) Tighten bolts in sequence:
 - Bolts 1 through 10 to 149 N·m (110 ft. lbs.) torque.
 - Bolt 11 to 135 N·m (100 ft. lbs.) torque.

- Bolts 12 through 14 to 149 N·m (110 ft. lbs.) torque.

CYLINDER HEAD BOLTS

POSITION	DESCRIPTION
1,4,5,12,13	1/2 in.-13 BOLT
8,9	1/2 in.-13 BOLT WITH DOWEL POINT
2,3,6,7,10,11,14	1/2 in.-13 WITH 7/16 in.-14 STUD END
All bolts are 12 point drives for rocker cover clearance	

(e) Check all bolts in sequence to verify the correct torque.

(f) If not already done, clean and mark each bolt with a dab of paint after tightening. Should you encounter bolts which were painted in an earlier service operation, replace them.

Fig. 56 Engine Cylinder Head Bolt Tightening Sequence

(6) Install the spark plugs and tighten to 37 N·m (27 ft. lbs.) torque.

(7) Connect the temperature sending unit wire connector.

(8) Install the ignition coil rail and coil rail electrical connectors.

(9) Install the intake and engine exhaust manifolds (refer to procedures in this section).

(10) Install the fuel line and the vacuum advance hose.

(11) Attach the power steering pump and bracket.

(12) Install the push rods, rocker arms, pivots and bridges in the order they were removed (refer to Rocker Arms and Push Rods in this section).

(13) Install the engine cylinder head cover.

(14) Attach the air conditioner compressor mounting bracket to the engine cylinder head and block. Tighten the bolts to 40 N·m (30 ft. lbs.) torque.

(15) Attach the air conditioning compressor to the bracket. Tighten the bolts to 27 N·m (20 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

CAUTION: The serpentine drive belt must be routed correctly. Incorrect routing can cause the water pump to turn in the opposite direction causing the engine to overheat.

(16) Install the serpentine drive belt. (refer to Group 7, Cooling System for the proper procedure).

(17) Install the air cleaner and ducting.

(18) Connect the hoses to the engine thermostat housing and fill the cooling system to the specified level (refer to Group 7, Cooling Systems for the proper procedure).

(19) The automatic transmission throttle linkage and cable must be adjusted after completing the engine cylinder head installation (refer to Group 21, Transmissions for the proper procedures).

(20) Install the temperature sending unit and connect the wire connector.

(21) If equipped with air conditioning, install A/C compressor and charge A/C system (refer to Group 24 Heating and Air Conditioning).

(22) Connect negative cable to battery.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(23) Operate the engine with the radiator cap off. Inspect for leaks and continue operating the engine until the engine thermostat opens. Add coolant, if required.

VALVES AND VALVE SPRINGS

This procedure is done with the engine cylinder head removed from the block.

REMOVAL

(1) Remove the engine cylinder head from the cylinder block.

(2) Use Valve Spring Compressor Tool MD-998772A and compress each valve spring.

(3) Remove the valve locks, retainers, springs and valve stem oil seals. Discard the oil seals.

(4) Use a smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.

(5) Remove the valves, and place them in a rack in the same order as removed.

INSTALLATION

(1) Thoroughly clean the valve stems and the valve guide bores.

(2) Lightly lubricate the stem.

(3) Install the valve in the original valve guide bore.

(4) Install the replacement valve stem oil seals on the valve stems. If the 0.381 mm (0.015 inch) over-size valve stems are used, oversize oil seals are required.

(5) Position the valve spring and retainer on the engine cylinder head and compress the valve spring with Valve Spring Compressor Tool MD-998772A.

(6) Install the valve locks and release the tool.

(7) Tap the valve spring from side to side with a hammer to ensure that the spring is properly seated at the engine cylinder head. Also tap the top of the retainer to seat the valve locks.

(8) Install the engine cylinder head.

HYDRAULIC TAPPETS

Retain all the components in the same order as removed.

REMOVAL

(1) Remove the engine cylinder head (Refer to cylinder head r&i in this section).

(2) Remove the push rods.

(3) Remove the tappets through the push rod openings in the cylinder block with a Hydraulic Valve Tappet Removal/Installation Tool (Fig. 57).

**Fig. 57 Hydraulic Valve Tappet Removal—
Installation Tool**

1 - HYDRAULIC TAPPET REMOVAL TOOL
2 - CYLINDER BLOCK

INSTALLATION

It is not necessary to charge the tappets with engine oil. They will charge themselves within a very short period of engine operation.

(1) Dip each tappet in Mopar Engine Oil Supplement, or equivalent.

(2) Use Hydraulic Valve Tappet Removal/Installation Tool to install each tappet in the same bore from where it was originally removed.

(3) Install the cylinder head assy (Refer to cylinder head r&i in this section).

(4) Install the push rods in their original locations.

REMOVAL AND INSTALLATION (Continued)

(5) Install the rocker arms and bridge and pivot assemblies at their original locations. Loosely install the capscrews at each bridge.

(6) Tighten the capscrews alternately, one turn at a time, to avoid damaging the bridges. Tighten the capscrews to 28 N·m (21 ft. lbs.) torque.

(7) Pour the remaining Mopar Engine Oil Supplement, or equivalent over the entire valve actuating assembly. The Mopar Engine Oil Supplement, or equivalent must remain with the engine oil for at least 1 609 km (1,000 miles). The oil supplement need not be drained until the next scheduled oil change.

(8) Install the engine cylinder head cover.

VIBRATION DAMPER

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the serpentine drive belt and fan shroud. Refer to Group 7, Cooling Systems for the procedures.
- (3) Remove the vibration damper retaining bolt and washer.
- (4) Use Vibration Damper Removal Tool 7697 to remove the damper from the crankshaft (Fig. 58).

Fig. 58 Vibration Damper Removal Tool 7697

- 1 - VIBRATION DAMPER REMOVAL TOOL
2 - WRENCH

INSTALLATION

(1) Apply Mopar Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key in position, align the keyway on the vibration damper hub with the crankshaft key and tap the damper onto the crankshaft.

(2) Install the vibration damper retaining bolt and washer.

(3) Tighten the damper retaining bolt to 108 N·m (80 ft. lbs.) torque.

(4) Install the serpentine drive belt. (Refer to Group 7, Cooling Systems for the proper specifications and procedures).

(5) Connect negative cable to battery.

TIMING CASE COVER

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the vibration damper.
- (3) Remove the fan and hub assembly and remove the fan shroud.
- (4) Remove the accessory drive brackets that are attached to the timing case cover.
- (5) Remove the A/C compressor (if equipped) and generator bracket assembly from the engine cylinder head and move to one side.
- (6) Remove the oil pan-to-timing case cover bolts and timing case cover-to-cylinder block bolts.
- (7) Remove the timing case cover and gasket from the engine.
- (8) Pry the crankshaft oil seal from the front of the timing case cover (Fig. 59).

Fig. 59 Timing Case Cover Components

- 1 - TIMING CASE COVER
2 - OIL SLINGER
3 - CRANKSHAFT OIL SEAL
4 - VIBRATION DAMPER PULLEY

INSTALLATION

Clean the timing case cover, oil pan and cylinder block gasket surfaces.

(1) Install a new crankshaft oil seal in the timing case cover. The open end of the seal should be toward the inside of the cover. Support the cover at the seal area while installing the seal. Force it into position with Seal Installation Tool 6139.

(2) Position the gasket on the cylinder block.

REMOVAL AND INSTALLATION (Continued)

(3) Position the timing case cover on the oil pan gasket and the cylinder block.

(4) Insert Timing Case Cover Alignment and Seal Installation Tool 6139 in the crankshaft opening in the cover (Fig. 60).

J9009-23

Fig. 60 Timing Case Cover Alignment and Seal Installation Tool 6139

1 - TIMING CASE COVER ALIGNMENT AND SEAL INSTALLATION TOOL

(5) Install the timing case cover-to-cylinder block and the oil pan-to-timing case cover bolts.

(6) Tighten the 1/4 inch cover-to-block bolts to 7 N·m (60 in. lbs.) torque. Tighten the 5/16 inch front cover-to-block bolts to 22 N·m (192 in. lbs.) torque. Tighten the oil pan-to-cover 1/4 inch bolts to 9.5 N·m (84 in. lbs.) torque.

(7) Remove the cover alignment tool.

(8) Apply a light film of engine oil on the vibration damper hub contact surface of the seal.

(9) Apply Mopar Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key inserted in the keyway in the crankshaft, install the vibration damper, washer and bolt. Lubricate and tighten the bolt to 108 N·m (80 ft. lbs.) torque.

(10) Install the A/C compressor (if equipped) and generator bracket assembly.

(11) Install the engine fan and hub assembly and shroud.

(12) Install the serpentine drive belt.

(13) Connect negative cable to battery.

TIMING CHAIN AND SPROCKETS

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the fan and shroud.
- (3) Remove the serpentine drive belt.
- (4) Remove the crankshaft vibration damper.
- (5) Remove the timing case cover.

(6) Rotate crankshaft until the "0" timing mark is closest to and on the center line with camshaft sprocket timing mark (Fig. 61).

80bfe0fa

Fig. 61 Crankshaft—Camshaft Alignment

- 1 - CAMSHAFT SPROCKET
- 2 - TIMING MARKS
- 3 - CRANKSHAFT SPROCKET

(7) Remove the oil slinger from the crankshaft.

(8) Remove the camshaft sprocket bolt and washer (Fig. 62).

80ble167

Fig. 62 Camshaft Sprocket and Thrust Plate

- 1 - CAMSHAFT
- 2 - CAMSHAFT SPROCKET W/INTEGRAL KEY
- 3 - BOLT & CUP WASHER
- 4 - THRUST PLATE

(9) Remove the crankshaft sprocket, camshaft sprocket and timing chain as an assembly.

REMOVAL AND INSTALLATION (Continued)

(10) Installation of the timing chain with the timing marks on the crankshaft and camshaft sprockets properly aligned ensures correct valve timing. A worn or stretched timing chain will adversely affect valve timing. If the timing chain deflects more than 12.7 mm (1/2 inch) replace it.

INSTALLATION

Assemble the timing chain, crankshaft sprocket and camshaft sprocket with the timing marks aligned (Fig. 61).

(1) Apply Mopar Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key in the keyway on the crankshaft, install the assembly on the crankshaft and camshaft.

(2) Install the camshaft sprocket bolt and washer (Fig. 62). Tighten the bolt to 68 N·m (50 ft. lbs.) torque.

(3) To verify correct installation of the timing chain, rotate the crankshaft 2 revolutions. The camshaft and crankshaft sprocket timing mark should align (Fig. 61).

(4) Install the crankshaft oil slinger.

(5) Replace the oil seal in the timing case cover.

(6) Install the timing case cover and gasket.

(7) With the key installed in the crankshaft keyway, install the vibration damper, washer and bolt. Lubricate and tighten the bolt to 108 N·m (80 ft. lbs.) torque.

(8) Install the serpentine drive belt. (refer to Group 7, Cooling System for the proper procedure).

(9) Install the fan and hub assembly. Install the shroud.

(10) Connect negative cable to battery.

CAMSHAFT

REMOVAL

WARNING: THE COOLANT IN A RECENTLY OPERATED ENGINE IS HOT AND PRESSURIZED. RELEASE THE PRESSURE BEFORE REMOVING THE DRAIN COCK, CAP AND DRAIN PLUGS.

(1) Disconnect negative cable from battery.

(2) Drain the cooling system. DO NOT waste reusable coolant. If the solution is clean, drain it into a clean container for reuse.

(3) Remove the radiator or radiator and condenser, if equipped with A/C (refer to Group 7, Cooling System for the proper procedure).

(4) Remove the engine cylinder head cover.

(5) Remove the rocker arms, bridges and pivots.

(6) Remove the push rods.

(7) Remove the engine cylinder head and gasket.

(8) Remove the hydraulic valve tappets from the engine cylinder block.

(9) Remove the vibration damper.

(10) Remove the timing case cover.

(11) Rotate the crankshaft until the crankshaft sprocket timing mark is aligned on centerline with the camshaft sprocket timing mark (Fig. 64).

(12) Remove the timing chain and sprockets.

(13) Remove the front bumper and/or grille, as required.

(14) Remove the two thrust plate retaining screws, thrust plate and camshaft (Fig. 63).

80bfe168

Fig. 63 Camshaft

1 - CAMSHAFT
2 - CRANKSHAFT

INSTALLATION

(1) Inspect the cam lobes for wear.

(2) Inspect the bearing journals for uneven wear pattern or finish.

(3) Inspect the bearings for wear.

(4) Inspect the distributor drive gear for wear.

(5) If the camshaft appears to have been rubbing against the thrust washer, examine the oil pressure relief holes in the rear cam journal. The oil pressure relief holes must be free of debris.

(6) Lubricate the camshaft with Mopar Engine Oil Supplement, or equivalent.

(7) Carefully install the camshaft to prevent damage to the camshaft bearings (Fig. 63).

(8) Position thrust plate and install retaining screws. Tighten screws to 24 N·m (18 ft. lbs.).

(9) Install the timing chain, crankshaft sprocket and camshaft sprocket with the timing marks aligned.

(10) Install the camshaft sprocket bolt/cup washer. Tighten the bolt to 68 N·m (50 ft. lbs.).

REMOVAL AND INSTALLATION (Continued)

80bfe0fa

Fig. 64 Crankshaft / Camshaft Sprocket Timing Mark Alignment

- 1 - CAMSHAFT SPROCKET

- 4 - VIBRATION DAMPER PULLEY

(13) Install the hydraulic valve tappets.

(14) Install the cylinder head gasket with the numbers facing up.

(15) Install the cylinder head and head bolts (Refer to cylinder head R&I in this section for torque values and tightening sequence).

(16) Install the push rods.

(17) Install the rocker arms and pivot and bridge assemblies. Tighten each of the capscrews for each bridge alternately, one turn at a time, to avoid damaging the bridge (Refer to Rocker Arms and Push Rods in this section).

(18) Install the engine cylinder head cover.

(19) Install the serpentine drive belt. (refer to Group 7, Cooling System for the proper procedure).

NOTE: During installation, lubricate the hydraulic valve tappets and all valve components with Mopar Engine Oil Supplement, or equivalent. The Mopar Engine Oil Supplement, or equivalent must remain with the engine oil for at least 1609 km (1,000 miles). The oil supplement need not be drained until the next scheduled oil change.

(20) Install the radiator, connect the hoses and fill the cooling system to the specified level (refer to Group 7, Cooling System for the proper procedure).

(21) Check the ignition timing and adjust as necessary.

(22) Install the grille and bumper, if removed.

(23) Connect negative cable to battery.

CAMSHAFT BEARINGS

REMOVAL

The camshaft rotates within four steel-shelled, bab-bitt-lined bearings that are pressed into the cylinder block and then line reamed. The camshaft bearing bores and bearing diameters are not the same size. They are stepped down in 0.254 mm (0.010 inch) increments from the front bearing (largest) to the rear bearing (smallest). This permits easier removal and installation of the camshaft. The camshaft bearings are pressure lubricated. Camshaft end play is maintained by the thrust plate.

(1) Remove the camshaft. Refer to Camshaft in this section for procedure.

NOTE: It is not advisable to attempt to replace camshaft bearings unless special removal and installation tools are available, such as recommended tool 8544 Camshaft Bushing Remover Installer.

(2) Using Special tool, remove the camshaft bearings.

INSTALLATION

(1) Inspect the camshaft bearing journals for uneven wear pattern or finish.

(2) Inspect the camshaft lobes and distributor gear for wear.

REMOVAL AND INSTALLATION (Continued)

(3) Inspect the camshaft thrust plate for wear. If the plate shows excessive wear inspect the camshaft oil pressure relief holes in the rear cam journal. The relief holes must be clean and free of debris.

CAUTION: Make sure outside diameter of number 1 bearing is clean. Make sure that the bearing is properly installed in the engine block, align the oil hole in the bearing with the oil gallery in the bearing bore. Failure to do so will cause inadequate oil supply for the sprockets and timing chain.

(4) Using special tool, install new camshaft bearings.

(5) Lubricate the camshaft with Mopar® engine oil supplement, or equivalent.

(6) Carefully install the camshaft to prevent damage to the camshaft bearings

(7) Position the thrust plate and install the two retaining screws. Tighten screws to 24 N·m (18 ft. lbs.).

(8) Install the camshaft sprocket, crankshaft sprocket and timing chain with the timing marks aligned. Install the sprocket bolt.

(9) Tighten the camshaft sprocket bolt and washer to 68 N·m (50 ft. lbs.).

(10) To verify correct installation of the timing chain, turn the crankshaft two full revolutions then position the camshaft sprocket timing mark as shown in (Fig. 66).

(11) Install the timing chain cover refer to the procedure in this section.

80bfe0fa

Fig. 66 Crankshaft / Camshaft Chain Drive Installation—Typical

- 1 - CAMSHAFT SPROCKET
- 2 - TIMING MARKS
- 3 - CRANKSHAFT SPROCKET

CRANKSHAFT MAIN BEARINGS

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the spark plugs.
- (3) Raise the vehicle.
- (4) Remove the oil pan and oil pump.
- (5) Remove main bearing cap brace (Fig. 67).
- (6) Remove only one main bearing cap and lower insert at a time (Fig. 68).
- (7) Remove the lower insert from the bearing cap.
- (8) Remove the upper insert by LOOSENING (DO NOT REMOVE) all of the other bearing caps. Now insert a small cotter pin tool in the crankshaft journal oil hole. Bend the cotter pin as illustrated to fabricate the tool (Fig. 69). With the cotter pin tool in place, rotate the crankshaft so that the upper bearing insert will rotate in the direction of its locking tab. Because there is no hole in the No.3 main journal, use a tongue depressor or similar soft-faced tool to remove the bearing insert (Fig. 69). After moving the insert approximately 25 mm (1 inch), it can be removed by applying pressure under the tab.

80a534e2

Fig. 67 Main Bearing Caps and Brace.

- 1 - BLOCK
- 2 - MAIN BEARING CAP BRACE

(9) Using the same procedure described above, remove the remaining bearing inserts one at a time for inspection.

REMOVAL AND INSTALLATION (Continued)

80a534e3

Fig. 68 Removing Main Bearing Caps and Lower Inserts

- 1 - CONNECTING ROD JOURNAL
2 - MAIN BEARING CAPS

80a534e4

Fig. 69 Removing Upper Inserts

- 1 - COTTER PIN
2 - BEARING INSERT
3 - TONGUE DEPRESSOR

INSTALLATION

(1) Lubricate the bearing surface of each insert with engine oil.

(2) Loosen all the main bearing caps. Install the main bearing upper inserts.

(3) Install the lower bearing inserts into the main bearing caps.

(4) On the rear main cap, apply Mopar® Gasket Maker sealer on both sides of cylinder block as shown in (Fig. 70). The dab of sealer should be 3 mm (0.125 in.) in diameter.

(5) Apply Mopar® Gasket Maker on the rear bearing cap. The bead should be 2.3 mm (0.09 in.) in diameter. DO NOT apply sealer to the lip of the seal.

80bfe13c

Fig. 70 Location of Sealer

- 1 - DOWEL
2 - SEALER LOCATIONS
3 - CYLINDER BLOCK
4 - HALFWAY BETWEEN
5 - REAR FACE OF CYLINDER BLOCK
6 - 3mm (0.125 in.)

(6) Install the main bearing cap(s) and lower insert(s).

(7) Tighten the bolts of caps 1, 2, 4, 5, 6, and 7 to 54 N·m (40 ft. lbs.) torque. Now tighten these bolts to 95 N·m (70 ft. lbs.) torque. Finally, tighten these bolts to 108 N·m (80 ft. lbs.) torque.

(8) Push the crankshaft forward and backward. Load the crankshaft front or rear and tighten cap bolt No.3 to 54 N·m (40 ft. lbs.) torque. Then tighten to 95 N·m (70 ft. lbs.) torque and finally tighten to 108 N·m (80 ft. lbs.) torque.

(9) Rotate the crankshaft after tightening each main bearing cap to ensure the crankshaft rotates freely.

(10) Check crankshaft end play. Crankshaft end play is controlled by the thrust bearing which is flange and installed at the No.2 main bearing position.

REMOVAL AND INSTALLATION (Continued)

(a) Attach a magnetic base dial indicator to the cylinder block at either the front or rear of the engine.

(b) Position the dial indicator rod so that it is parallel to the center line of the crankshaft.

(c) Pry the crankshaft forward, position the dial indicator to zero.

(d) Pry the crankshaft forward and backward. Note the dial indicator readings. End play is the difference between the high and low measurements (Fig. 71). Correct end play is 0.038-0.165 mm (0.0015-0.0065 inch). The desired specifications are 0.051-0.064 mm (0.002-0.0025 inch).

(e) If end play is not within specification, inspect crankshaft thrust faces for wear. If no wear is apparent, replace the thrust bearing and measure end play. If end play is still not within specification, replace the crankshaft.

Fig. 71 Crankshaft End Play Measurement

- 1 - DIAL INDICATOR
2 - CRANKSHAFT

(11) If the crankshaft was removed, install the crankshaft into the cylinder block (refer to Cylinder Block - Assemble).

(12) Install main bearing cap brace tighten nuts to 47 N·m (35 ft. lbs.) torque.

(13) Install oil pump assy. and tighten attaching bolts to 23 N·m (17 ft. lbs.)

(14) Install the oil pan.

(15) Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(16) Lower the vehicle.

(17) Install the spark plugs. Tighten the plugs to 37 N·m (27 ft. lbs.) torque.

(18) Fill the oil pan with engine oil to the full mark on the dipstick level.

(19) Connect negative cable to battery.

OIL PAN

REMOVAL

(1) Disconnect negative cable from battery.

(2) Raise the vehicle.

(3) Remove the oil pan drain plug and drain the engine oil.

(4) Disconnect the exhaust pipe at the exhaust manifold.

(5) Disconnect the exhaust hanger at the catalytic converter and lower the pipe.

(6) Remove the starter motor.

(7) Remove the engine flywheel and transmission torque converter housing access cover.

(8) If equipped with an oil level sensor, disconnect the sensor.

(9) Position a jack stand directly under the engine vibration damper.

(10) Place a piece of wood (2 x 2) between the jack stand and the engine vibration damper.

(11) Remove the engine mount through bolts.

(12) Using the jack stand, raise the engine until adequate clearance is obtained to remove the oil pan.

(13) Remove transmission oil cooling lines (if equipped) and oxygen sensor wiring supports that are attached to the oil pan studs.

(14) Remove the oil pan bolts and studs. Carefully slide the oil pan and gasket to the rear. If equipped with an oil level sensor, take care not to damage the sensor.

INSTALLATION

(1) Clean the block and pan gasket surfaces.

(2) Fabricate 4 alignment dowels from 1 1/2 x 1/4 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 72).

Fig. 72 Fabrication of Alignment Dowels

- 1 - 1/4" x 1 1/2" BOLT
2 - DOWEL
3 - SLOT

REMOVAL AND INSTALLATION (Continued)

(3) Install two dowels in the timing case cover. Install the other two dowels in the cylinder block (Fig. 73).

J9209-17

Fig. 73 Position of Dowels in Cylinder Block

- 1 - DOWEL HOLES
- 2 - CYLINDER BLOCK
- 3 - 5/16" HOLES
- 4 - 5/16" HOLES

(4) Apply Mopar® Silicone Rubber Adhesive Sealant on cylinder block to rear main bearing cap corners and cylinder block to front cover joints (four places) (Fig. 74).

(5) Slide the one-piece gasket over the dowels and onto the block and timing case cover.

(6) Position the oil pan over the dowels and onto the gasket. If equipped with an oil level sensor, take care not to damage the sensor.

(7) Install the 1/4 inch oil pan bolts. Tighten these bolts to 9.5 N·m (84 in. lbs.) torque. Install the 5/16 inch oil pan bolts (Fig. 75). Tighten these bolts to 15 N·m (132 in. lbs.) torque.

80b897d9

- 1 - SEALER LOCATIONS

80abd2b4

Fig. 75 Position of 5/16 inch Oil Pan Bolts

- 1 - OIL PAN
- 2 - OIL PAN DRAIN PLUG

(8) Remove the dowels. Install the remaining 1/4 inch oil pan bolts. Tighten these bolts to 9.5 N·m (84 in. lbs.) torque.

(9) Lower the engine until it is properly located on the engine mounts.

(10) Install the through bolts and tighten the nuts.

(11) Lower the jack stand and remove the piece of wood.

(12) Install the engine flywheel and transmission torque converter housing access cover.

(13) Install the engine starter motor.

(14) Connect the exhaust pipe to the hanger and to the engine exhaust manifold.

(15) Install transmission oil cooling lines (if equipped) and oxygen sensor wiring supports that attach to the oil pan studs.

(16) Install the oil pan drain plug (Fig. 75). Tighten the plug to 34 N·m (25 ft. lbs.) torque.

(17) Lower the vehicle.

(18) Connect negative cable to battery.

(19) Fill the oil pan with engine oil to the specified level.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(20) Start the engine and inspect for leaks.

PISTONS AND CONNECTING RODS

REMOVAL

- (1) Remove the engine cylinder head cover.
- (2) Remove the rocker arms, bridges and pivots.
- (3) Remove the push rods.
- (4) Remove the engine cylinder head.
- (5) Position the pistons one at a time near the bottom of the stroke. Use a ridge reamer to remove the

REMOVAL AND INSTALLATION (Continued)

ridge from the top end of the cylinder walls. Use a protective cloth to collect the cuttings.

- (6) Raise the vehicle.
- (7) Drain the engine oil.
- (8) Remove the oil pan and gasket.
- (9) Remove main bearing cap brace (Fig. 76).

Fig. 76 Main Bearings Caps and Brace

- 1 - BLOCK
- 2 - MAIN BEARING CAP BRACE

(10) Remove the connecting rod bearing caps and inserts. Mark the caps and rods with the cylinder bore location. The connecting rods and caps are stamped with a two letter combination (Fig. 77).

Fig. 77 Stamped Connecting Rods and Caps

- 1 - CONNECTING ROD CAP
- 2 - CONNECTING ROD

(11) Lower the vehicle until it is about 2 feet from the floor.

CAUTION: Ensure that the connecting rod bolts **DO NOT** scratch the crankshaft journals or cylinder walls. Short pieces of rubber hose, slipped over the rod bolts will provide protection during removal.

(12) Have an assistant push the piston and connecting rod assemblies up and through the top of the cylinder bores (Fig. 78).

Fig. 78 Removal of Connecting Rod and Piston Assembly

- 1 - PISTON
- 2 - CONNECTING ROD
- 3 - BLOCK

INSTALLATION

(1) Clean the cylinder bores thoroughly. Apply a light film of clean engine oil to the bores with a clean lint-free cloth.

(2) Install the piston rings on the pistons if removed.

(3) Lubricate the piston and rings with clean engine oil.

CAUTION: Ensure that connecting rod bolts **DO NOT** scratch the crankshaft journals or cylinder walls. Short pieces of rubber hose slipped over the connecting rod bolts will provide protection during installation.

REMOVAL AND INSTALLATION (Continued)

(4) Use a piston ring compressor to install the connecting rod and piston assemblies through the top of the cylinder bores (Fig. 79).

(5) Ensure the arrow on the piston top points to the front of the engine (Fig. 79).

Fig. 79 Rod and Piston Assembly Installation

(6) Raise the vehicle.

(7) Each bearing insert is fitted to its respective journal to obtain the specified clearance between the bearing and the journal. In production, the select fit is obtained by using various-sized, color-coded bearing inserts as listed in the Connecting Rod Bearing Fitting Chart. The color code appears on the edge of the bearing insert. The size is not stamped on inserts used for production of engines.

(8) The rod journal is identified during the engine production by a color-coded paint mark on the adjacent cheek or counterweight toward the flange (rear) end of the crankshaft. The color codes used to indicate journal sizes are listed in the Connecting Rod Bearing Fitting Chart.

(9) When required, upper and lower bearing inserts of different sizes may be used as a pair (refer to Connecting Rod Bearing Fitting Chart). A standard size insert is sometimes used in combination with a 0.025 mm (0.001 inch) undersize insert to reduce clearance 0.013 mm (0.0005 inch).

CAUTION: DO NOT intermix bearing caps. Each connecting rod and bearing cap are stamped with the cylinder number. The stamp is located on a machined surface adjacent to the oil squirt hole that faces the camshaft side of the cylinder block.

(10) Install the connecting rod bearing caps and inserts in the same positions as removed.

CAUTION: Verify that the oil squirt holes in the rods face the camshaft and that the arrows on the pistons face the front of the engine.

(11) Install main bearing cap brace (Fig. 76). Tighten nuts to 47 N·m (35 ft. lbs.).

(12) Install the oil pan and gaskets as outlined in the installation procedure.

(13) Lower the vehicle.

(14) Install the engine cylinder head, push rods, rocker arms, bridges, pivots and engine cylinder head cover.

(15) Fill the crankcase with engine oil.

CRANKSHAFT OIL SEALS—REAR

The crankshaft rear main bearing oil seal consists of two half pieces of viton with a single lip that effectively seals the rear of the crankshaft. Replace the upper and lower seal halves as a unit to ensure leak-free operation.

REMOVAL

(1) Remove transmission inspection cover.

(2) Remove oil pan. Refer to procedure in this section

(3) Remove main bearing cap brace.

(4) Remove rear main bearing cap (No.7).

(5) Push upper seal out of the groove. Ensure that the crankshaft and seal groove are not damaged.

(6) Remove lower half of the seal from the bearing cap.

INSTALLATION

(1) Wipe the seal surface area of the crankshaft until it is clean.

(2) Apply a thin coat of engine oil.

(3) Coat lip of the seal with engine oil.

(4) Carefully position the upper seal into the groove in the cylinder block. The lip of the seal faces toward the front of the engine.

(5) Apply Mopar® Gasket Maker sealer on both sides of cylinder block as shown in (Fig. 80). The dab of sealer should be 3 mm (0.125 in.) in diameter.

(6) Apply Mopar® Gasket Maker on the rear bearing cap (Fig. 80). The bead should be 2.3 mm (0.09 in.) in diameter. DO NOT apply sealer to the lip of the seal.

(7) Position the lower seal into the bearing cap recess and seat it firmly. Be sure the seal is flush with the cylinder block pan rail.

(8) Coat the outer curved surface of the lower seal with soap and the lip of the seal with engine oil.

(9) Install the rear main bearing cap. DO NOT strike the cap more than twice for proper engagement.

(10) Tighten all main bearing bolts to 108 N·m (80 ft. lbs.) torque.

(11) Install the main bearing cap brace. Tighten nuts to 47 N·m (35 ft. lbs.).

(12) Install the oil pan gasket and oil pan. Tighten 1/4 – 20 screws to 14 N·m (120 in. lbs.). Tighten 5/16 – 18 screws to 18 N·m (156 in. lbs.).

REMOVAL AND INSTALLATION (Continued)

(13) Apply Mopar® Silicone Rubber Adhesive Sealant on cylinder block to rear main bearing cap corners and cylinder block to front cover joints (four places) (Fig. 81)

80b897d9

Fig. 81 Oil Pan Sealer Location

- 1 - SEALER LOCATIONS

(14) Install transmission inspection cover.

OIL PUMP

A gear-type oil pump is mounted at the underside of the cylinder block opposite the No.4 main bearing.

The pump incorporates a nonadjustable pressure relief valve to limit maximum pressure to 517 kPa (75 psi). In the relief position, the valve permits oil to bypass through a passage in the pump body to the inlet side of the pump.

Oil pump removal or replacement will not affect the distributor timing because the distributor drive gear remains in mesh with the camshaft gear.

REMOVAL

- (1) Drain the engine oil.
- (2) Remove the oil pan.
- (3) Remove the pump-to-cylinder block attaching bolts. Remove the pump assembly with gasket (Fig. 82).

CAUTION: If the oil pump is not to be serviced, **DO NOT** disturb position of oil inlet tube and strainer assembly in pump body. If the tube is moved within the pump body, a replacement tube and strainer assembly must be installed to assure an airtight seal.

J9509-85

Fig. 82 Oil Pump Assembly

- 1 - OIL FILTER ADAPTOR
- 2 - BLOCK
- 3 - GASKET
- 4 - OIL INLET TUBE
- 5 - OIL PUMP
- 6 - STRAINER ASSEMBLY
- 7 - ATTACHING BOLTS

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

- (1) Install the oil pump on the cylinder block using a replacement gasket. Tighten the bolts to 23 N·m (17 ft. lbs.) torque.
- (2) Install the oil pan.
- (3) Fill the oil pan with oil to the specified level.

TIMING CASE COVER OIL SEAL

This procedure is done with the timing case cover installed.

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Remove the serpentine drive belt.
- (3) Remove the vibration damper.
- (4) Remove the radiator shroud.
- (5) Carefully remove the oil seal. Make sure seal bore is clean.

INSTALLATION

- (1) Position the replacement oil seal on Timing Case Cover Alignment and Seal Installation Tool 6139 with seal open end facing inward. Apply a light film of Perfect Seal, or equivalent, on the outside diameter of the seal. Lightly coat the crankshaft with engine oil.
- (2) Position the tool and seal over the end of the crankshaft and insert a draw screw tool into Seal Installation Tool 6139 (Fig. 83). Tighten the nut against the tool until it contacts the cover.

Fig. 83 Timing Case Cover Oil Seal Installation

- 1 - SEAL INSTALLATION TOOL
2 - DRAW SCREW TOOL

- (3) Remove the tools. Apply a light film of engine oil on the vibration damper hub contact surface of the seal.

- (4) Apply Mopar Silicone Rubber Adhesive Sealant to the keyway in the crankshaft and insert the key. With the key inserted in the keyway in the crankshaft, install the vibration damper, washer and bolt. Lubricate and tighten the bolt to 108 N·m (80 ft. lbs.) torque.

- (5) Install the serpentine belt and tighten to the specified tension (refer to Group 7, Cooling Systems for the proper specifications and procedures).

- (6) Install the radiator shroud.
- (7) Connect negative cable to battery.

DISASSEMBLY AND ASSEMBLY

CYLINDER BLOCK

DISASSEMBLY

Refer to the applicable sections for detailed instructions.

- (1) Drain the engine oil. Remove and discard the oil filter.
- (2) Remove the water pump from the cylinder block.
- (3) Remove the vibration damper.
- (4) Remove the timing case cover and lay the cover upside down.
- (5) Position a drift punch into the slot in the back of the cover and tap the old seal out.
- (6) Remove the oil slinger from crankshaft.
- (7) Remove the camshaft retaining bolt and remove the sprockets and chain as an assembly.
- (8) Remove the camshaft.
- (9) Remove the oil pan and gasket.
- (10) Remove the front and rear oil galley plugs.
- (11) Remove the oil pump.
- (12) Remove the connecting rods and the pistons. Remove the connecting rod and piston assemblies through the top of the cylinder bores.
- (13) Remove the crankshaft.

ASSEMBLY

Refer to the applicable sections for detailed instructions.

- (1) Install the crankshaft.
- (2) Install the connecting rods and the pistons through the top of the cylinder bores.
- (3) Install the oil pump.
- (4) Install the oil pan and gasket.
- (5) Install the camshaft.
- (6) Install the sprockets and chain as an assembly.
- (7) Install the oil slinger from the crankshaft.
- (8) Install the timing case cover seal.
- (9) Install the timing case cover.
- (10) Install the vibration damper.
- (11) Install the water pump. Tighten the mounting bolts to 31 N·m (23 ft. lbs.) torque.

DISASSEMBLY AND ASSEMBLY (Continued)

- (12) Lubricate the oil filter seal with clean engine oil. Tighten oil filter to 18 N·m (156 in. lbs.) torque.
- (13) Install the engine into the vehicle.
- (14) Fill the engine with clean lubrication oil (refer to Group 0, Lubrication and Maintenance).
- (15) Fill the cooling system.

CLEANING AND INSPECTION

CYLINDER HEAD

CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and engine exhaust manifold and engine cylinder head mating surfaces. Remove all gasket material and carbon.

Check to ensure that no coolant or foreign material has fallen into the tappet bore area.

Remove the carbon deposits from the combustion chambers and top of the pistons.

INSPECTION

Use a straightedge and feeler gauge to check the flatness of the engine cylinder head and block mating surfaces.

CYLINDER HEAD COVER

CLEANING

Remove any original sealer from the cover sealing surface of the engine cylinder head and clean the surface using a fabric cleaner.

Remove all residue from the sealing surface using a clean, dry cloth.

INSPECTION

Inspect the engine cylinder head cover for cracks. Replace the cover, if cracked.

The original dark grey gasket material should NOT be removed. If sections of the gasket material are missing or are compressed, replace the engine cylinder head cover. However, sections with minor damage such as small cracks, cuts or chips may be repaired with a hand held applicator. The new material must be smoothed over to maintain gasket height. Allow the gasket material to cure prior to engine cylinder head cover installation.

ROCKER ARMS AND PUSH RODS

CLEANING

Clean all the components with cleaning solvent.

Use compressed air to blow out the oil passages in the rocker arms and push rods.

INSPECTION

Inspect the pivot surface area of each rocker arm. Replace any that are scuffed, pitted, cracked or excessively worn.

Inspect the valve stem tip contact surface of each rocker arm and replace any rocker arm that is deeply pitted.

Inspect each push rod end for excessive wear and replace as required. If any push rod is excessively worn because of lack of oil, replace it and inspect the corresponding hydraulic tappet for excessive wear.

Inspect the push rods for straightness by rolling them on a flat surface or by shining a light between the push rod and the flat surface.

A wear pattern along the length of the push rod is not normal. Inspect the engine cylinder head for obstruction if this condition exists.

HYDRAULIC TAPPETS

CLEANING

Clean each tappet assembly in cleaning solvent to remove all varnish, gum and sludge deposits.

INSPECTION

Inspect for indications of scuffing on the side and base of each tappet body.

Inspect each tappet base for concave wear with a straightedge positioned across the base. If the base is concave, the corresponding lobe on the camshaft is also worn. Replace the camshaft and defective tappets.

After cleaning and inspection, test each tappet for specified leak-down rate tolerance to ensure zero-lash operation (Fig. 84).

Swing the weighted arm of the hydraulic valve tappet tester away from the ram of the Leak-Down Tester.

(1) Place a 7.925-7.950 mm (0.312-0.313 inch) diameter ball bearing on the plunger cap of the tappet.

(2) Lift the ram and position the tappet (with the ball bearing) inside the tester cup.

(3) Lower the ram, then adjust the nose of the ram until it contacts the ball bearing. DO NOT tighten the hex nut on the ram.

(4) Fill the tester cup with hydraulic valve tappet test oil until the tappet is completely submerged.

(5) Swing the weighted arm onto the push rod and pump the tappet plunger up and down to remove air. When the air bubbles cease, swing the weighted arm away and allow the plunger to rise to the normal position.

(6) Adjust the nose of the ram to align the pointer with the SET mark on the scale of the tester and tighten the hex nut.

CLEANING AND INSPECTION (Continued)

(7) Slowly swing the weighted arm onto the push rod.

(8) Rotate the cup by turning the handle at the base of the tester clockwise one revolution every 2 seconds.

(9) Observe the leak-down time interval from the instant the pointer aligns with the START mark on the scale until the pointer aligns with the 0.125 mark. A normally functioning tappet will require 20-110 seconds to leak-down. Discard tappets with leak-down time interval not within this specification.

Fig. 84 Leak-Down Tester

- 1 - POINTER
- 2 - WEIGHTED ARM
- 3 - RAM
- 4 - CUP
- 5 - HANDLE
- 6 - PUSH ROD

CYLINDER BLOCK

CLEANING

Thoroughly clean the oil pan and engine block gas-
ket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the plugs to 34 N·m (25 ft. lbs.) torque.

INSPECTION

(1) It is mandatory to use a dial bore gauge to measure each cylinder bore diameter (Fig. 85). To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.

Fig. 85 Cylinder Bore Measurement

(2) Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.

(3) Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.

(4) Determine taper by subtracting the smaller diameter from the larger diameter.

(5) Rotate measuring device 90° and repeat steps above.

(6) Determine out-of-roundness by comparing the difference between each measurement.

(7) If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds these maximum limits, the cylinder must be bored and then honed to accept an oversize piston. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	SPECIFICATION
Flatness Max.	0.20 mm - max. for total length (0.008 in. max. for total length)
ROCKER ARMS, PUSH RODS & TAPPETS	
Rocker Arm Ratio	1.6:1
Push Rod Length (Pink)	244.856 to 245.364 mm (9.640 to 9.660 in.)
Push Rod Diameter	7.92 to 8.00 mm (0.312 to 0.315 in.)
Hydraulic Tappet Diameter	22.962 to 22.974 mm (0.904 to 0.9045 in.)
Tappet-to-Bore Clearance	0.025 to 0.063 mm (0.001 to 0.0025 in.)
VALVES	
Valve Length (Overall)	
Intake	122.479 to 122.860 mm (4.822 to 4.837 in.)
Exhaust	122.860 to 123.241 mm (4.837 to 4.852 in.)
Valve Stem Diameter	7.899 to 7.925 mm (0.311 to 0.312 in.)
Stem-to-Guide Clearance	0.025 to 0.076 mm (0.001 to 0.003 in.)
Valve Head Diameter	
Intake	48.387 to 48.641 mm (1.905 to 1.915 in.)
Exhaust	37.973 to 38.227 mm (1.495 to 1.505 in.)
Valve Face Angle	
Intake	46.5°
Exhaust	46.5°
Tip Refinishing (Max. Allowable)	0.25 mm (0.010 in.)

DESCRIPTION	SPECIFICATION
VALVE SPRINGS	
Free Length (Approx.) Spring Load	47.65 mm (1.876 in.)
Valve Closed	316 to 351 N @ 41.656 mm (71 to 79 lbf. @ 1.64 in.)
Valve Open	898.6 to 969.7 N @ 30.89 mm (202 to 218 lbf @ 1.216 in.)
Inside Diameter	21.0 mm to 21.51 mm (0.827 to 0.847 in.)
Installed Height	41.656 mm (1.64 in.)
PISTONS	
Weight (Less Pin)	417 to 429 grams (14.7 to 15.1 oz.)
Piston Pin Bore (Centerline to Piston Top)	40.61 to 40.72 mm (1.599 to 1.603 in.)
Piston-to-Bore Clearance	0.018 to 0.038 mm (0.0008 to 0.0015 in.)
Ring Gap Clearance	
Top Compression Ring	0.229 to 0.610 mm (0.0090 to 0.0240 in.)
2nd Compression Ring	0.483 to 0.965 mm (0.0190 to 0.0380 in.)
Oil Control Steel Rails	0.254 to 1.500 mm (0.010 to 0.060 in.)
Ring Side Clearance	
Compression Rings	0.042 to 0.084 mm (0.0017 to 0.0033 in.)
Oil Control Rings	0.06 to 0.21 mm (0.0024 to 0.0083 in.)
Piston Ring Groove Height	
Compression Rings	1.530 to 1.555 mm (0.0602 to 0.0612 in.)
Oil Control Ring	4.035 to 4.060 mm (0.1589 to 0.1598 in.)

SPECIFICATIONS (Continued)

DESCRIPTION	SPECIFICATION
Piston Ring Groove Diameter	
No.1 Compression Ring	88.39 to 88.65 mm (3.48 to 3.49 in.)
No.2 Compression Ring	87.63 to 87.88 mm (3.45 to 3.46 in.)
Oil Control Ring	89.66 to 89.92 mm (3.53 to 3.54 in.)
Piston Pin Bore Diameter	23.650 to 23.658 mm (0.9312 to 0.9315 in.)
Piston Pin Diameter	23.637 to 23.640 mm (0.9306 to 0.9307 in.)
Piston-to-Pin Clearance	0.0102 to 0.0208 mm (0.0005 to 0.0009 in.)
Piston-to-Pin Connecting Rod (Press Fit)	8.9 kN (2000 lbf.)
OIL PUMP	
Gear-to-Body Clearance	0.051 to 0.102 mm
(Radial)	(0.002 to 0.004 in.)
Gear-to-Body Clearance (Radial) Preferred	0.051 mm (0.002 in.)
Gear End Clearance Plastigage	0.051 to 0.152 mm (0.002 to 0.006 in.)
Gear End Clearance Plastigage (Preferred)	0.051 mm (0.002 in.)
Gear End Clearance Feeler Gauge	0.1016 to 0.2032 mm (0.004 to 0.008 in.)
Gear End Clearance Feeler Gauge (Preferred)	0.1778 mm (0.007 in.)
Oil Pressure	
At Idle Speed	89.6 kPa (13 psi)
At 1600 rpm & Higher	255 to 517 kPa (37 to 75 psi)
Oil Pressure Relief	517 kPa (75 psi)

DESCRIPTION AND OPERATION

ENGINE IDENTIFICATION

DESCRIPTION

The engine model code and serial number are stamped on the left side of the engine block, just below the oil dipstick tube (Fig. 1). The engine code on the XJ 2.5L is DD85C followed by a 5 digit serial number.

Fig. 1 Engine Code Location

DIAGNOSIS AND TESTING (Continued)

Displacement	2.5L (2499 cc)
Bore	92.00
Stroke	94.00
Compression Ratio	21:1
Vacuum at idle	600 mm/Hg (23.6 In/Hg)
Belt Tension	400/500 N Automatic Tensioner
Thermostat Opening . . .	80°C ± 2°C
Generator Rating	Denso 12V—95A
Cooling System Capacity.	9.5 Liter
P/S Capacity	0.75 Liter
Engine Oil Capacity . . .	7.2L w/filter change
Timing System	Pushrod operated overhead valves, with gear-driven camshaft in crankcase.
Air Intake	Dry filter.
Fuel Feed	Vane pump incorporated in injection pump.
Fuel System	Indirect fuel injection (precumbustion chamber).
Combustion Cycle	4 stroke
Cooling System	Water cooling.
Injection Pump	Rotary pump and electronically managed.
Lubrication	Pressure lubrication by rotary pump, full-flow filtration.
Engine Rotation	Clockwise viewed from front cover.

Engine Description

DIAGNOSIS AND TESTING

SERVICE DIAGNOSIS—DIESEL—
PERFORMANCE

CONDITION	POSSIBLE CAUSES	CORRECTION
ENGINE WILL NOT CRANK OR CRANKS SLOWLY	<ol style="list-style-type: none"> Starting motor operating, but not cranking the engine. Crankshaft rotation restricted. Starting circuit connections loose or corroded. Neutral safety switch or starter relay inoperative. Battery charge low. 	<ol style="list-style-type: none"> Remove the starter motor. Check for broken flywheel teeth or a broken starting motor spring. Rotate the engine to check for rotational resistance. Clean and tighten connections. Check starter relay supply voltage and proper operation of neutral safety switch (if equipped). Replace defective parts. Check battery voltage. Replace battery if a charge cannot be held.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
	6. No voltage to starter solenoid. 7. Solenoid or starter motor inoperative.	6. Check voltage to solenoid. If necessary, replace the solenoid. 7. Replace starter motor.
ENGINE CRANKS, BUT WILL NOT START NO SMOKE	1. No fuel in supply tank. 2. Electrical fuel shutdown solenoid not operating. 3. Exhaust plugged. 4. Fuel filter plugged. 5. Excessive fuel inlet restriction. 6. Injection pump not getting fuel or fuel is aerated. 7. Worn or inoperative injection pump.	1. Fill fuel supply. 2. Check for loose wires and verify that the fuel shutdown solenoid and fuel shutdown solenoid relay is functioning. 3. Remove the obstruction. 4. Drain fuel/water separator and replace fuel filter. 5. Check fuel inlet restriction. Correct cause. 6. Check fuel flow/bleed fuel system. 7. Visually check delivery with externally connected injector to one of the pump outlets. Repair or replace the pump if fuel is not being delivered.
ENGINE HARD TO START, OR WILL NOT START SMOKE FROM EXHAUST	1. Incorrect starting procedure. 2. Cranking speed too slow. 3. Cylinder heads heater plugs relay defective. 4. One or more cylinder head heater plugs defective. 5. Insufficient intake air.	1. The fuel shutoff solenoid control must be in the run position. Ensure proper procedure is being used. 2. (A) Verify that the transmission is not engaged. (B) Check the battery, starting motor and look for loose or corroded wiring connections. 3. Verify system is working. Repair/replace inoperative parts. 4. Verify system is working. Repair/replace inoperative parts. 5. Inspect or replace filter and check for obstruction to the air supply tube.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
ENGINE HARD TO START, OR WILL NOT START SMOKE FROM EXHAUST (CONT.)	<p>6. Air in fuel system or the fuel supply is inadequate.</p> <p>7. Contaminated fuel.</p> <p>8. Fuel screen plugged.</p> <p>9. One or more injectors worn or not operating properly.</p> <p>10. Worn or inoperative injection pump.</p> <p>11. Injection pump out of time.</p> <p>12. Engine compression low.</p> <p>13. Camshaft out of time.</p>	<p>6. Check the flow through the filter and bleed the system. Locate and eliminate the air source.</p> <p>7. Verify by operating the engine with clean fuel from a temporary tank. Check for presence of gasoline. Drain and flush fuel supply tank. Replace fuel/water separator filter.</p> <p>8. Check fuel screen.</p> <p>9. Check/replace improperly operating injectors.</p> <p>10. Visually check fuel delivery with an externally connected injector to one of the pump outlets. Repair or replace the pump if fuel is not being delivered.</p> <p>11. Check/Time the pump (refer to Group 14, Fuel System).</p> <p>12. Check compression to identify the problem.</p> <p>13. Check camshaft timing.</p>
ENGINE STARTS, BUT WILL NOT KEEP RUNNING	<p>1. Cylinder heads heater plugs relay defective.</p> <p>2. One or more cylinder head heater plugs defective.</p> <p>3. Intake air or exhaust system restricted.</p> <p>4. Air in the fuel supply system or the fuel supply is inadequate.</p> <p>5. Fuel waxing due to extremely cold weather.</p> <p>6. Contaminated fuel.</p>	<p>1. Verify system is working. Repair/replace inoperative parts.</p> <p>2. Verify system is working. Repair/replace inoperative parts.</p> <p>3. Visually check for exhaust restriction and inspect the air intake.</p> <p>4. Check flow through the filter and bleed the system. Locate and eliminate the air source.</p> <p>5. Verify by inspecting the fuel filter. Clean the system and use climatized fuel. Replace fuel/water separator filter. Check fuel heater for proper operation.</p> <p>6. Verify by operating the engine with clean fuel from a temporary supply tank. Check for presence of gasoline. Replace fuel/water separator filter.</p>
SURGING (SPEED CHANGE)	<p>1. If the condition occurs at idle, the idle speed is set too low for the accessories.</p> <p>2. High pressure fuel leak.</p> <p>3. One or more injectors worn or not operating properly.</p> <p>4. Improperly operating injection pump.</p>	<p>1. Adjust the idle speed.</p> <p>2. Inspect/correct leaks in the high pressure lines. Fitting and delivery valve sealing washers.</p> <p>3. Check/replace the inoperative injectors.</p> <p>4. Replace the injector pump.</p>

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
ROUGH IDLE (IRREGULARLY FIRING OR ENGINE SHAKING)	<ol style="list-style-type: none"> 1. If engine is cold, glow plug relay or glow plug(s) defective. 2. Engine mounts damaged or loose. 3. High pressure fuel leaks. 4. Air in the fuel system. 5. Sticking needle valve in an injector. 	<ol style="list-style-type: none"> 1. Refer to troubleshooting for cylinder head heater plugs (see Group 14, Fuel system). 2. Repair or replace mounts. 3. Correct leaks in the high pressure lines, fittings or delivery valves. 4. Bleed the fuel system and eliminate the source of the air. 5. Check and replace the injector with the sticking needle valve.
ENGINE RUNS ROUGH	<ol style="list-style-type: none"> 1. Fuel injection lines leaking. 2. Air in the fuel or the fuel supply is inadequate. 3. Contaminated fuel. 4. Incorrect valve operation. 5. Injection pump timing incorrect. 6. Improperly operating injectors. 7. Defective injection pump (delivery valve). 8. Camshaft out of time. 9. Damaged camshaft or tappets. 10. Automatic timing advance not operating. 	<ol style="list-style-type: none"> 1. Correct leaks in the high pressure lines, fittings, injectors sealing washers or delivery valves. 2. Check the flow through the filter and bleed the system. Locate and eliminate the air source. 3. Verify by operating the engine with clean fuel from a temporary supply tank. Check for presence of gasoline. Replace fuel/water separator filter. 4. Check for a bent push rod and adjust valves. Replace push rod, if necessary. 5. Check/time pump (refer to Group 14, Fuel System). 6. Replace inoperative injectors. 7. Repair or replace injection pump. 8. Check/correct gear train timing alignment. 9. Inspect camshaft valve lift. Replace camshaft and tappets. 10. Check injection pump. Check fuel injector sensor at number 1 cylinder injector.
ENGINE RPM WILL NOT REACH RATED SPEED	<ol style="list-style-type: none"> 1. Engine overload. 2. Improperly operating tachometer. 3. Inadequate fuel supply. 4. Air/fuel controls leak. 	<ol style="list-style-type: none"> 1. Verify high idle speed without load. Investigate operation to be sure correct gear is being used. 2. Verify engine speed with hand tachometer, correct as required. 3. Check the fuel flow through the system to locate the reason for inadequate fuel supply, correct as required. 4. Check and repair leak. Check AFC tubing for obstruction.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
ENGINE RPM WILL NOT REACH RATED SPEED (CONT.)	6. Improperly operating injection pump.	6. Repair or replace injection pump.
LOW POWER	1. Fuel control lever not moving to full throttle. 2. High oil level. 3. Engine overloaded. 4. Slow throttle response caused by leaking or obstructed air control tube or improperly operating control in the pump. 5. Inadequate intake air flow. 6. Inadequate fuel supply. Air in the fuel. 7. Excessive exhaust restriction. 8. High fuel temperature. 9. Poor quality fuel or fuel contaminated with gasoline. 10. Air leak between the turbocharger and the intake manifold. 11. Exhaust leak at the manifold or turbocharger. 12. Improperly operating turbocharger. 13. Wastegate operation. 14. Valve not operating. 15. Worn or improperly operating injectors. 16. Incorrect injection pump timing. 17. Improperly operating injection pump.	1. Check/correct for stop-to-stop travel. 2. Check/correct oil level. 3. Check for added loading from accessories or driven units, brakes dragging and other changes in vehicle loading. Repair/replace as needed. 4. Check for leaks and obstructions. Tighten the fittings. Repair or replace the pump if the controls are not functioning. 5. Inspect/replace air cleaner element. Look for other restrictions. 6. Check the flow through the filter to locate the source of the restriction. Check fuel pressure and inlet restriction. 7. Check/correct the restriction in the exhaust system. 8. Verify that fuel heater is off when engine is warm. Check for restricted fuel drain tubes. Repair/replace as needed. 9. Verify by operating from a temporary tank with good fuel. Check for presence of gasoline. Replace fuel/water separator filter. 10. Check/correct leaks in hoses, gaskets, charge air cooler and around mounting capscrews or through holes in the manifold cover. 11. Check/correct leaks in the manifold or turbocharger gaskets. If manifold is cracked, replace manifold. 12. Inspect/replace turbocharger. 13. Check wastegate operation. 14. Check for bent push rod, replace if necessary. 15. Check/replace injectors. 16. Verify injection pump timing (see Group 14, Fuel System). 17. Repair or replace injection pump.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE EXHAUST SMOKE	<ol style="list-style-type: none"> 1. Engine running too cold (white smoke). 2. Improper starting procedure (white smoke). 3. Fuel supply inadequate. 4. Injection pump timing. 5. Inadequate intake air. 6. Air leak between turbocharger and intake manifold. 7. Exhaust leak at the manifold or turbocharger. 8. Improperly operating turbocharger. 9. Improperly operating injectors. 10. Improperly operating or overfueled injector pump. 11. Piston rings not sealing (blue smoke). 	<ol style="list-style-type: none"> 1. Refer to troubleshooting for coolant temperature below normal (refer to Group 7, Cooling System). Inspect cylinder head heater plugs for proper operation. 2. Use proper starting procedures. 3. Check fuel supply pressure and inlet restriction. 4. Check and time pump (refer to Group 14, Fuel System). 5. Inspect/change air filter. Look for other restriction. Check charge air cooler for obstructions. 6. Check/correct leaks in the air crossover tube, hoses, gaskets, mounting capscrews or through holes in the manifold cover. 7. Check/correct leaks in the manifold or turbocharger gaskets. If cracked replace manifold. 8. Inspect/replace turbocharger. 9. Check and replace inoperative injectors. 10. Repair or replace injection pump. 11. Perform blow-by check. Correct as required.
ENGINE WILL NOT SHUT-OFF	<ol style="list-style-type: none"> 1. Fuel shutoff solenoid inoperative. 2. Engine running on fumes drawn into the air intake. 3. Fuel injection pump malfunction 	<ol style="list-style-type: none"> 1. Check/replace fuel shutoff solenoid. 2. Check the air intake ducts for the source of fumes. WARNING: In case of engine runaway due to flammable fumes from gasoline spills or turbocharger oil leaks being sucked into the engine, shut off engine ignition switch first then use a CO2 fire extinguisher and direct the spray under the front bumper to remove oxygen supply. The engine air intake is on the passenger side behind the bumper. The fire extinguisher must be directed at this location for emergency shutdown conditions. 3. Repair or replace fuel injection pump.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
COOLANT TEMPERATURE ABOVE NORMAL	<ol style="list-style-type: none"> 1. Low coolant level. 2. Incorrect/improperly operating pressure cap. 3. Loose drive belt on water pump/fan. 4. Inadequate air flow to the radiator. 5. Radiator fins plugged. 6. Collapsed radiator hose. 7. Improperly operating temperature sensor/gauge. 8. Improperly operating, incorrect or no thermostat. 9. Air in the cooling system. 10. Inoperative water pump. 11. Incorrect injection pump timing. 12. Overfueled injection pump. 13. Plugged cooling passages in radiator, head, head gasket or block. 14. Engine overloaded. 	<ol style="list-style-type: none"> 1. Check coolant level. Add coolant, if necessary. Locate and correct the source of the coolant loss, (refer to Group 7, Cooling). 2. Replace cap with the correct rating for the system. 3. Check/replace belt or belt tensioner. 4. Check/repair radiator core, fan shroud and viscous fan drive as required. 5. Blow debris from fins. 6. Replace the hose. Check coolant tank cap operation, (refer to Group 7, Cooling Tanks). 7. Verify that the gauge and temperature sensor are accurate. Replace gauge/sensor, if bad. 8. Check and replace the thermostat. 9. (A) make sure the fill rate is not being exceeded and the correct vented thermostat is installed. (B) Check for loose hose clamps. Tighten if loose. (C) If aeration continued, check for a compression leak through the head gasket. 10. Check and replace the water pump. 11. Verify pump timing marks are aligned. Check/time the injector pump (refer to Group 14, Fuel System). 12. Repair or replace the injection pump. 13. Flush the system and fill with clean coolant. 14. Verify that the engine load rating is not being exceeded.
COOLANT TEMPERATURE BELOW NORMAL	<ol style="list-style-type: none"> 1. Too much air flow across the radiator. 2. Incorrect thermostat or contamination in thermostat. 3. Temperature sensor or gauge inoperative. 4. Coolant not flowing by temperature sensor. 	<ol style="list-style-type: none"> 1. Check/repair viscous fan drive as required. 2. Check and replace thermostat. 3. Verify that the gauge and sensor are accurate. If not, replace gauge/sensor. 4. Check and clean coolant passages.

DIAGNOSIS AND TESTING (Continued)

SERVICE DIAGNOSIS—DIESEL—MECHANICAL.

CONDITION	POSSIBLE CAUSES	CORRECTION
LUBRICATING OIL PRESSURE LOW	<ol style="list-style-type: none"> 1. Low oil level. 2. Oil viscosity thin, diluted or wrong specification. 3. Improperly operating pressure switch/gauge. 4. Relief valve stuck open. 5. Plugged oil filter. 6. If cooler was replaced, shipping plugs left in cooler. 7. Worn oil pump. 8. Suction tube loose or seal leaking. 9. Loose main bearing cap. 10. Worn bearings or wrong bearings installed. 11. Oil jet under piston bad fit into main carrier. 	<ol style="list-style-type: none"> 1. (A) Check and fill with clean engine oil. (B) Check for a severe external oil leak that could reduce the pressure. 2. Verify the correct oil is being used. Check for oil dilution. Refer to Contaminated Lube Oil (Engine Diagnosis Mechanical). 3. Verify the pressure switch is functioning correctly. If not, replace switch/gauge. 4. Check/replace valve. 5. Change oil filter. Oil filter change interval may need to be revised. 6. Check/remove shipping plugs. 7. Check and replace oil pump. 8. Check and replace seal. Check and install new bearing and tighten cap to proper torque. 10. Inspect and replace connecting rod or main bearings. Check and replace piston cooling nozzles. 11. Check oil jet position.
LUBRICATING OIL PRESSURE TOO HIGH	<ol style="list-style-type: none"> 1. Pressure switch/gauge not operating properly. 2. Engine running too cold. 3. Oil viscosity too thick. 4. Oil pressure relief valve stuck closed or binding. 	<ol style="list-style-type: none"> 1. Verify the pressure switch is functioning correctly. If not, replace switch/gauge. 2. Refer to Coolant Temperature Below Normal (Engine Diagnosis Performance). 3. Make sure the correct oil is being used, (Refer to Group 0, Lubrication and Maintenance). 4. Check and replace valve.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
LUBRICATING OIL LOSS	<ol style="list-style-type: none"> 1. External leaks. 2. Crankcase being overfilled. 3. Incorrect oil specification or viscosity. 4. Oil cooler leak. 5. High blow-by forcing oil out the breather. 6. Turbocharger leaking oil to the air intake. 7. Piston rings not sealing (oil being consumed by the engine). 	<ol style="list-style-type: none"> 1. Visually inspect for oil leaks. Repair as required. 2. Verify that the correct dipstick is being used. 3. (A) Make sure the correct oil is being used. (B) Look for reduced viscosity from dilution with fuel. (C) Review/reduce the oil change intervals. 4. Check and replace the oil cooler. 5. Check the breather tube area for signs of oil loss. Perform the required repairs. 6. Inspect the air ducts for evidence of oil transfer. Repair as required. 7. Perform blow-by check. Repair as required.
COMPRESSION KNOCKS	<ol style="list-style-type: none"> 1. Air in the fuel system. 2. Poor quality fuel or water/gasoline contaminated fuel 3. Engine overloaded. 4. Incorrect injection pump timing. 5. Improperly operating injectors. 	<ol style="list-style-type: none"> 1. Bleed the fuel system (refer to Group 14, Fuel System). 2. Verify by operating from a temporary tank with good fuel. Clean and flush the fuel supply tanks. Replace fuel/water separator. 3. Verify the engine load rating is not being exceeded. 4. Check and time injection pump (refer to Group 14, Fuel System). 5. Check and replace inoperative injectors.
EXCESSIVE VIBRATION	<ol style="list-style-type: none"> 1. Loose or broken engine mounts. 2. Damaged fan or improperly operating accessories. 3. Improperly operating vibration damper. 4. Improperly operating viscous fan drive. 5. Worn or damaged generator bearing. 6. Flywheel housing misaligned. 7. Loose or broken power component. 8. Worn or unbalanced driveline components. 	<ol style="list-style-type: none"> 1. Replace engine mounts. 2. Check and replace the vibrating components. 3. Inspect/replace the vibration damper. 4. Inspect/replace the fan drive. 5. Check/replace the generator. 6. Check/correct flywheel alignment. 7. Inspect the crankshaft and rods for damage that causes an unbalance. Repair/replace as required. 8. Check/repair driveline components.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE ENGINE NOISES	1. Drive belt squeal, insufficient tension or abnormally high loading.	1. Check the automatic tensioner and inspect the drive belt. Make sure water pump, tensioner pulley, fan hub and generator turn freely.
	2. Intake air or exhaust leaks.	2. Refer to Excessive Exhaust smoke (Engine Diagnosis Performance).
	3. Turbocharger noise.	3. Check turbocharger impeller and turbine wheel for housing contact. Repair/replace as required.
	4. Gear train noise.	4. Visually inspect and measure gear backlash. Replace gears as required.
	5. Power function knock.	5. Check/replace rod and main bearings.
GENERATOR NOT CHARGING OR INSUFFICIENT CHARGING	1. Loose or corroded battery. 2. Generator belt slipping. 3. Generator pulley loose on shaft. 4. Improperly operating generator.	1. Clean/tighten battery connection. 2. Check/replace automatic abelt tensioner. Check/replace and adjust belt. 3. Tighten pulley 4. Check/replace generator.

TAPPET NOISE

(1) To determine source of tappet noise, operate engine at idle with cylinder head covers removed.

(2) Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.

(3) Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak down around the unit plunger or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating or by foreign particles becoming wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.

The valve train generates a noise very much like a light tappet noise during normal operation. Care

must be taken to ensure that tappets are making the noise. In general, if more than one tappet seems to be noisy, its probably not the tappets.

SERVICE PROCEDURES

VALVE SERVICE

This procedure is done with the engine cylinder head removed from the block.

DISASSEMBLY

(1) Remove the engine cylinder head from the cylinder block. Refer to cylinder head removal and installation in this section.

(2) Use Valve Spring Compressor Tool and compress each valve spring.

(3) Remove the valve locks, retainers, and springs.

(4) Use an Arkansas smooth stone or a jewelers file to remove any burrs on the top of the valve stem, especially around the groove for the locks.

(5) Remove the valves, and place them in a rack in the same order as removed.

VALVE CLEANING

(1) Clean all carbon deposits from the combustion chambers, valve ports, valve stems, valve stem guides and head.

(2) Clean all grime and gasket material from the engine cylinder head machined gasket surface.

SERVICE PROCEDURES (Continued)

INSPECTION

- (1) Inspect for cracks in the combustion chambers and valve ports.
- (2) Inspect for cracks on the exhaust seat.
- (3) Inspect for cracks in the gasket surface at each coolant passage.
- (4) Inspect valves for burned, cracked or warped heads.
- (5) Inspect for scuffed or bent valve stems.
- (6) Replace valves displaying any damage.
- (7) Check valve spring height (Fig. 2).

Fig. 2 Valve Spring Chart

VALVE REFACING

- (1) Use a valve refacing machine to reface the intake and exhaust valves to the specified angle.
- (2) After refacing, a margin of at least 4.52-4.49 mm (.178-.177 inch) must remain (Fig. 3). If the margin is less than 4.49 mm (.177 inch), the valve must be replaced.

VALVE SEAT REFACING

- (1) Install a pilot of the correct size in the valve guide bore. Reface the valve seat to the specified angle with a good dressing stone. Remove only enough metal to provide a smooth finish.
- (2) Use tapered stones to obtain the specified seat width when required.

VALVE STAND DOWN

Valve stand down is to maintain the adequate compression ratio.

- (1) Invert cylinder head.
- (2) Fit each valve to its respective valve guide.

Fig. 3 Valve Specification

- (3) Using a straight edge and feeler gauge (Fig. 4), check valve head stand down: Inlet valve head stand down 1.08 to 1.34 mm (.042 to .052 ins.) and exhaust valve stand down .99 to 1.25 mm (.035 to .049 ins.).

- (4) If valve head stand down is not in accordance with above, discard original valves, check stand down

SERVICE PROCEDURES (Continued)

with new valves and recut valve seat inserts to obtain correct stand down.

Fig. 4 Checking Valve Stand Down

VALVE GUIDES

- (1) Valve Guides height requirement.
- (2) Measurement A (Fig. 5): 13.50 - 14.00 mm.

Fig. 5 Valve Guide Height

VALVE STEM-TO-GUIDE CLEARANCE MEASUREMENT

- (1) Measure and record internal diameter of valve guides. Valve guide internal diameter is 8.0 to 8.015 mm (.3149 to .3155 ins.).
- (2) Measure valve stems and record diameters. Intake valve stem diameter 7.94 to 7.96 mm (.3125 to .3133 in). Exhaust valve stem diameter 7.92 to 7.94 mm (.3118 to .3125 in).
- (3) Subtract diameter of valve stem from internal diameter of its respective valve guide to obtain valve stem clearance in valve guide. Clearance of inlet valve stem in valve guide is .040 to .075 mm (.0015 to .0029 in). Clearance of exhaust valve stem in valve guide is .060 to .093 mm (.0023 to .0036 in).
- (4) If valve stem clearance in valve guide exceeds tolerances, new valve guides must be installed.

REMOVAL AND INSTALLATION

ENGINE MOUNTS — LHD DIESEL

The engine mounts support the engine at each side. These supports are made of resilient rubber.

REMOVAL—RIGHT SIDE

- (1) Disconnect the negative battery cable.
- (2) Remove the innercooler inlet hose from the turbocharger and position it out of the way (Fig. 6).

Fig. 6 Engine Compartment View — Diesel

- 1 - INTAKE MANIFOLD ELBOW
- 2 - BREATHER HOSE
- 3 - INNERCOOLER OUTLET HOSE
- 4 - AIR FILTER COVER
- 5 - AIR FILTER OUTLET (FRESH AIR) HOSE
- 6 - INNERCOOLER INLET HOSE
- 7 - HEATER CORE COOLANT SUPPLY HOSES

- (3) Remove the right engine mount upper sill plate nuts.
- (4) Raise the vehicle on a hoist.
- (5) Remove the oil filter and adaptor from the engine.
- (6) Remove the engine mount throughbolt nut only. Do not remove the bolt at this time.
- (7) Position a jack stand and raise the weight off the right engine mount.
- (8) Remove the (2) engine mount lower sill plate bolts.
- (9) Remove the (4) engine mount bracket bolts from the engine block.
- (10) Remove the engine mount through bolt.
- (11) Remove the right engine mount from the vehicle.

REMOVAL AND INSTALLATION (Continued)

INSTALLATION—RIGHT SIDE

(1) Position the engine mount and bracket and install the engine mount through bolt and nut, leaving them loose at this time.

(2) Install, but do not torque the engine mount lower sill plate bolts.

(3) Install the (4) engine mount bracket to engine block retaining bolts and torque to 61 N·m (45 ft. lbs.).

(4) Torque the engine mount lower sill plate bolts to 41 N·m (30 ft. lbs.).

(5) Remove the jack stand.

(6) Torque the engine mount throughbolt nut to 65 N·m (48 ft. lbs.).

(7) Install the oil filter and adaptor on the engine. Torque the adaptor retaining bolt to 69 N·m (51 ft. lbs.).

(8) Lower the vehicle from the hoist.

(9) Install the engine mount upper sill plate nuts. Torque to 41 N·m (30 ft. lbs.).

(10) Install the innercooler inlet hose on the turbocharger (Fig. 6).

(11) Connect the negative battery cable.

REMOVAL—LEFT SIDE

(1) Disconnect the negative battery cable.

(2) Remove the refrigerant line support bracket from the rear of the rocker cover.

(3) Disconnect the A/C compressor electrical connector.

(4) Remove the (2) engine mount upper sill plate nuts (Fig. 7).

Fig. 7 Left Engine Mount Sill Plate Nuts

- 1 - SILL PLATE NUTS
- 2 - STEERING SHAFT
- 3 - ENGINE MOUNT

(5) Make sure the steering shaft is in the unlocked position. Raise the vehicle on a hoist.

(6) Remove the steering shaft pinchbolt. Remove the shaft from the gearbox by sliding it straight off the gearbox input shaft.

CAUTION: Do not rotate the steering shaft while removed from the gearbox input shaft. Damage to the steering column clockspring will occur.

(7) Remove the left engine mount throughbolt nut only (Fig. 8). Do not remove the bolt at this time.

Fig. 8 A/C Compressor Position & Orientation

- 1 - A/C COMPRESSOR MOUNTING BOLTS
- 2 - LEFT ENGINE MOUNT THROUGHOLT NUT
- 3 - H BLOCK BOLTS
- 4 - COUPLER PINCH BOLT
- 5 - COMPRESSOR ELECTRICAL CONNECTOR

(8) Loosen the (4) H-Block retaining bolts, Do not remove the bolts at this time.

NOTE: Mark the position of the H-Block in relation to the power steering pump and the A/C Compressor so it may be installed in its original position.

(9) Remove the (2) H-Block retaining bolts from the power steering pump side of the block (Fig. 8).

(10) Support the A/C Compressor with mechanics wire before proceeding to the next step.

(11) Remove the (4) A/C Compressor retaining bolts (Fig. 8).

(12) Remove the remaining (2) bolts from the H-Block and remove the H-Block from the compressor.

REMOVAL AND INSTALLATION (Continued)

(13) Position a jack stand and raise the weight off the left engine mount.

(14) Remove the (4) engine mount bracket bolts from the engine block.

(15) Remove the (4) trackbar support bracket bolts and remove the bracket (Fig. 9).

80b9a4be

Fig. 9 Left Engine Mount Retaining Bolts

- 1 – TRACK BAR SUPPORT BRACKET RETAINING BOLTS
2 – ENGINE MOUNT SILL PLATE BOLT

(16) Remove the remaining engine mount lower sill plate bolt (Fig. 9).

(17) Remove the engine mount troughbolt.

(18) Remove the left engine mount from the vehicle.

INSTALLATION—LEFT SIDE

(1) Position the engine mount and bracket and install the engine mount through bolt and nut, leaving them loose at this time.

(2) Install, but do not torque the engine mount lower sill plate bolt and the trackbar support bracket bolts (Fig. 9).

(3) Install the (4) engine mount bracket bolts. Torque to 61 N·m (45 ft. lbs.).

(4) Torque the lower engine mount sill plate bolts to 41 N·m (30 ft. lbs.) (Fig. 9).

(5) Torque the larger trackbar support bracket bolts to 125 N·m (92 ft. lbs.) (Fig. 9).

(6) Remove the jack stand.

(7) Position the H-Block and the A/C Compressor in their original positions and install the retaining bolts (Fig. 10).

(8) Torque the A/C Compressor mounting bolts to 41 N·m (30 ft. lbs.) (Fig. 10).

80b9a4c0

2 – LEFT ENGINE MOUNT THROUGH BOLT NUT
3 – H BLOCK BOLTS
4 – COUPLER PINCH BOLT
5 – COMPRESSOR ELECTRICAL CONNECTOR

(9) Torque all the H-Block retaining bolts to 18 N·m (159 in. lbs.).

(10) Torque the engine mount throughbolt nut to 65 N·m (48 ft. lbs.) (Fig. 10).

(11) Install the steering shaft. Torque the pinch-bolt to 49 N·m (36 ft. lbs.).

(12) Lower the vehicle from the hoist.

(13) Install the engine mount upper sill plate nuts. Torque to 41 N·m (30 ft. lbs.) (Fig. 11).

(14) Install the refrigerant line support bracket on the rear of the rocker cover.

(15) Connect the A/C compressor electrical connector.

(16) Connect the negative battery cable.

ENGINE MOUNTS — RHD DIESEL

The engine mounts support the engine at each side. These supports are made of resilient rubber.

REMOVAL—RIGHT SIDE

(1) Disconnect the negative battery cable.

(2) Make sure the steering wheel is in the unlocked position. Raise the vehicle on a hoist.

(3) Remove the steering shaft pinchbolt and slide the steering shaft straight off the gearbox input shaft.

REMOVAL AND INSTALLATION (Continued)

- 1 - SILL PLATE NUTS
- 2 - STEERING SHAFT
- 3 - ENGINE MOUNT

CAUTION: Do not rotate the steering shaft while removed from the gearbox input shaft. Damage to the steering column clockspring will occur.

(4) Remove the oil filter adaptor retaining bolt and remove oil filter and adaptor from the vehicle.

(5) Remove the engine mount upper sill plate nuts (Fig. 12).

80b9a4c1

Fig. 12 Right Engine Mount Sill Plate Nuts

- 1 - SILL PLATE NUTS
- 2 - STEERING SHAFT
- 3 - ENGINE MOUNT

(6) Remove the engine mount throughbolt nut only. Leave the bolt installed at this time.

(7) Position a jack stand and raise the weight off the right engine mount.

(8) Remove the (4) trackbar support bracket retaining bolts and remove the bracket.

(9) Remove the (4) engine mount bracket bolts from the engine block.

(10) Remove the remaining engine mount lower sill plate bolt.

(11) Remove the engine mount through bolt.

(12) Remove the right engine mount from the vehicle.

INSTALLATION—RIGHT SIDE

(1) Position the engine mount and bracket in position and install the engine mount through bolt and nut, leaving them loose at this time.

(2) Install, but do not torque the engine mount lower sill plate bolts and the trackbar support bracket bolts.

(3) Install the (4) engine mount bracket to engine block retaining bolts. Torque bolts to 61 N·m (45 ft. lbs.).

(4) Torque the engine mount lower sill plate bolts to 41 N·m (30 ft. lbs.).

(5) Torque the larger trackbar support bracket bolts to 125 N·m (92 ft. lbs.).

(6) Install the oil filter and adaptor on the engine. Torque oil filter adaptor retaining bolt to 69 N·m (51 ft. lbs.).

(7) Remove the jack stand.

(8) Install the engine mount upper sill plate nuts. Torque to 41 N·m (30 ft. lbs.).

(9) Torque the engine mount throughbolt nut to 65 N·m (48 ft. lbs.).

(10) Install the steering shaft and torque the pinchbolt to 49 N·m (36 ft. lbs.).

(11) Lower the vehicle from the hoist.

(12) Connect the negative battery cable.

REMOVAL—LEFT SIDE

(1) Disconnect the negative battery cable.

(2) Remove the refrigerant line support bracket bolt from the upper radiator support crossmember..

(3) Remove the A/C filter-drier assembly support bracket nuts from the left fenderwell.

(4) Disconnect A/C compressor electrical connector (Fig. 13).

(5) Raise the vehicle on a hoist.

(6) Remove the engine mount throughbolt nut only (Fig. 13). Leave the bolt installed at this time.

(7) Loosen the (4) H-Block retaining bolts, Do not remove the bolts at this time.

REMOVAL AND INSTALLATION (Continued)

- 4 - COUPLER PINCH BOLT
- 5 - COMPRESSOR ELECTRICAL CONNECTOR

NOTE: Mark the position of the H-Block in relation to the power steering pump and A/C Compressor so it may be installed in its original position.

(8) Remove the (2) H-Block retaining bolts from the power steering pump side of the block (Fig. 13).

(9) Support the A/C Compressor with mechanics wire before proceeding to the next step.

(10) Remove the (4) A/C Compressor mounting bolts (Fig. 13).

(11) Remove the remaining (2) bolts from H-Block and remove the H-Block from the compressor.

(12) Position a jack stand and raise the weight off the left engine mount.

(13) Remove the (2) engine mount upper sill plate nuts.

(14) Remove the (4) engine mount bracket bolts from the engine block.

(15) Remove the (2) engine mount lower sill plate bolts.

(16) Remove the engine mount troughbolt.

(17) Remove the left engine mount from the vehicle.

INSTALLATION—LEFT SIDE

(1) Position the engine mount and bracket in position and install the engine mount through bolt and nut, leaving them loose at this time.

(2) Install, but do not torque engine mount lower sill plate bolts.

(3) Install the (4) engine mount bracket to engine block retaining bolts. Torque to 61 N·m (45 ft. lbs.).

(4) Torque the (2) lower engine mount sill plate bolts to 41 N·m (30 ft. lbs.).

(5) Install the (2) engine mount upper sill plate nuts. Torque to 41 N·m (30 ft. lbs.).

(6) Remove the jack stand.

(7) Position the H-Block and the A/C Compressor in their original positions and install the retaining bolts (Fig. 14).

(8) Torque the A/C Compressor mounting bolts to 41 N·m (30 ft. lbs.) (Fig. 14).

(9) Torque all the H-Block bolts to 18 N·m (159 in. lbs.) (Fig. 14).

(10) Torque the engine mount throughbolt nut to 65 N·m (48 ft. lbs.) (Fig. 14).

(11) Lower the vehicle from the hoist.

(12) Install the refrigerant line support bracket.

(13) Install the A/C filter-drier support bracket.

(14) Connect the negative battery cable.

REMOVAL AND INSTALLATION (Continued)

2.5L DIESEL ENGINE

REMOVAL

(1) Disconnect both of the battery cables and remove the battery.

(2) Mark the hinge locations on the hood for alignment reference during installation.

CAUTION: Wrap the appropriate size drillbit with masking tape 1/4 inch from tip. This will prevent damaging the hood outer panel when drilling out the rivets retaining the hood latch cable control assembly.

(3) Drill out the rivets retaining the hood latch cable control assembly.

(4) Remove the hood latch assemblies from the hood.

(5) Disconnect and remove the engine compartment lamp.

(6) With assistance from another person, remove the hood

(7) Cover both of the fenders and the grill opening panel to prevent paint damage.

(8) Remove the battery tray.

(9) Disconnect the radiator cooling fan electrical.

(10) Remove the manual cooling fan and let set inside of the fan shroud.

(11) If equipped, recover the refrigerant. Refer to Group 24, Heating and Air Conditioning for the procedure.

(12) Disconnect the suction and discharge lines and remove the lines from the vehicle.

(13) Disconnect the breather hose and remove the air filter outlet hose from the vehicle (Fig. 15).

(14) Disconnect the oil pressure sensor electrical connector (Fig. 15).

(15) Disconnect the EGR vacuum supply hose from the engine (Fig. 15).

(16) Remove the coolant reservoir cap.

(17) Drain the cooling system. Refer to Group 7, Cooling System for the procedure.

(18) Remove the upper and lower radiator hoses from the engine.

(19) Remove the innercooler inlet and outlet hoses from the engine (Fig. 15).

(20) Remove the coolant reservoir supply hose from the engine (Fig. 15).

(21) On L. H. D. vehicles, disconnect the heater core coolant supply and the brake vacuum supply hoses from the engine.

(22) On R. H. D. vehicles, disconnect the heater core coolant supply and the brake vacuum supply hoses from the right side of the engine compartment. Remove the line assembly retaining bolt and bracket

80b9a492

from the rear of the rocker cover and position the assembly out of the way.

(23) Working inside of the vehicle, remove the center console. Refer to Group 23, Body for the procedure.

(24) Remove the shifter boot seal.

(25) Disconnect the shifter from the transmission

(26) Raise the vehicle on a hoist.

(27) Remove the lower fan shroud retaining bolts and remove the lower fan shroud panel.

(28) Remove the engine ground wire (Fig. 16).

(29) Remove the right and left engine mount throughbolt nuts only. Do not remove the bolts at this time (Fig. 16).

(30) Drain the transmission fluid. Refer to Group 21, Transmission and Transfer Case for the procedure.

(31) Mark the position of the front and rear driveshafts in relation to their companion flanges.

(32) Remove the front driveshaft. Refer to Group 3, Differential and Driveline for the procedure.

(33) Remove the rear driveshaft. Refer to Group 3, Differential and Driveline for the procedure.

(34) Disconnect the exhaust system at the (3) bolt flange (Fig. 17).

REMOVAL AND INSTALLATION (Continued)

(38) Disconnect the electrical connectors and the vent hose and from the transfer case and transmission.

(39) Support the rear of the transmission with a jack.

(40) Remove the transmission support crossmember.

(41) Lower the transmission to gain access to the transmission to engine retaining bolts.

(42) Remove all the bolts securing the transmission to the engine assembly. Remove the transmission and the transfer case assembly from the vehicle.

(43) Lower the vehicle from the hoist.

(44) Remove the fan shroud and both cooling fans as an assembly.

(45) Remove the oil filter and adaptor from the vehicle as an assembly.

(46) Remove the power steering fluid pressure line from the steering gear.

(47) Disconnect the electrical connectors from the bottom of the fuel / water separator.

(48) Drain the fuel / water separator. Refer to Group 9, Fuel System for the procedure.

(49) Remove the fuel lines from the fuel / water separator and cap.

(50) Remove the fuel / water separator and mounting bracket assembly from the bulkhead.

(51) Remove all the remaining wiring from the engine assembly and position it out of the way.

(52) Attach a lifting device to the engine lifting brackets and slightly raise the weight off the engine mounts.

(53) Remove the right and left engine mount throughbolts.

(54) Carefully lift the engine out of the engine compartment.

INSTALLATION

(1) Carefully place the engine assembly into the engine compartment..

(2) Install the engine mount throughbolts and nuts in there original position. Leaving them loose at this time.

(3) Install the fuel / water separator and mounting bracket on the bulkhead.

(4) Install the fuel lines on the fuel / water separator.

(5) Connect the electrical connectors to the bottom of the fuel/water separator.

(6) Install the power steering fluid pressure line on the steering gear.

(7) Install the oil filter and adaptor on the engine. Torque adaptor retaining bolt to 69 N·m (51 ft. lbs.). Fill the oil filter prior to installation.

(8) Install the fan shroud and both cooling fans as an assembly in the vehicle.

(9) Raise the vehicle on a hoist.

(10) Install the transmission and transfer case assembly in the vehicle.

(11) Install the bolts securing the transmission to the engine assembly. Torque to 74.6 N·m (55 ft. lbs.).

(12) Position, connect and secure all electrical connectors and vent hoses on the transfer case and transmission in there original positions.

(13) Install the transmission support crossmember. Torque bolts to 50 N·m (37 ft. lbs.).

(14) Install the (3) nuts retaining the transfer case shift linkage (Fig. 20).

Fig. 20 Transfer Case Shift Linkage — 4x4

- 1 – FRONT DRIVESHAFT
- 2 – SHIFTER LINKAGE RETAINING NUTS
- 3 – TRANSFER CASE
- 4 – TRANSMISSION

(15) Install the clutch slave cylinder on the clutch housing, making sure the cylinder pushrod is properly aligned with the clutch fork (Fig. 21).

(16) Connect the exhaust system at the (3) bolt flange (Fig. 22).

(17) Install the exhaust system support clamp (Fig. 22).

(18) Install the rear driveshaft in its original position.

(19) Install the front driveshaft in its original position.

(20) Install the lower fan shroud panel and retaining bolt.

(21) Install the engine ground wire (Fig. 23).

(22) Lower the vehicle from the hoist.

REMOVAL AND INSTALLATION (Continued)

Fig. 21 Clutch Slave Cylinder

- 1 - CLUTCH SLAVE CYLINDER
- 2 - CLUTCH SLAVE CYLINDER RETAINING NUTS
- 3 - FRONT DRIVESHAFT

Fig. 23 Engine Ground Wire Location

- 3 - OIL PAN

Fig. 22 Exhaust System Inlet Pipe Connection

- 1 - OIL PAN
- 2 - EXHAUST INLET PIPE FLANGE RETAINING BOLTS
- 3 - EXHAUST SYSTEM SUPPORT CLAMP

(23) Working inside the vehicle, install the shifter on the transmission

(24) Install the shifter boot seal.

(25) Install the center console. Refer to Group 23, Body for the procedure.

(26) Position, connect and secure all engine wiring in its original position

(27) On L. H. D. vehicles, connect the heater core coolant supply and brake vacuum supply hoses on the engine.

(28) On R. H. D. vehicles, position the steel line assembly and connect the heater core coolant supply and the brake vacuum supply hoses on the engine.

(29) Install the coolant reservoir supply hose on the engine (Fig. 24).

(30) Install the innercooler inlet and outlet hoses on the engine (Fig. 24).

(31) Install the upper and lower radiator hoses on the engine.

(32) Fill the cooling system. Refer to Group 7, Cooling System, for the procedure.

(33) Connect the oil pressure sensor electrical connector (Fig. 24).

(34) Connect the EGR vacuum supply hose on the engine (Fig. 24).

(35) Install the air filter outlet hose and connect the breather hose on the engine (Fig. 24).

(36) Install the refrigerant suction and discharge lines. Torque the retaining bolts on the A/C compressor to 22 N·m (200 in. lbs.). Make sure the O-Rings are well lubricated and free of tears.

(37) Charge the refrigerant system. Refer to Group 24, Heating and Air Conditioning for the procedure.

(38) Install the manual cooling fan.

REMOVAL AND INSTALLATION (Continued)

80b9a492

Fig. 24 LHD Engine Compartment — Diesel

- 1 - HEATER CORE COOLANT SUPPLY HOSES
- 2 - INNERCOOLER OUTLET HOSE
- 3 - AIR FILTER OUTLET HOSE
- 4 - EGR VACUUM SUPPLY HOSE
- 5 - OIL PRESSURE SENSOR CONNECTOR
- 6 - INNERCOOLER INLET HOSE
- 7 - COOLANT SUPPLY HOSE

(39) Connect the electric cooling fan electrical connector.

(40) Install the battery tray.

(41) With assistance from another person, install the hood.

NOTE: Use the previously marked hinge locations for alignment reference.

(42) Install the hood retaining bolts.

(43) Install the rivets on the hood latch cable control assembly.

(44) Install the hood latch assemblies on the hood.

(45) Install and connect the engine compartment lamp.

(46) Install the battery and connect both of the battery cables.

(47) Fill the power steering fluid. Refer to Group 19, Steering — Power Steering Pump-Initial operation for the procedure.

(48) Fill the transmission fluid. Refer to Group 21, Transmission and Transfer Case for the procedure.

(49) Check the engine oil level before engine start up.

CYLINDER HEAD COVER**REMOVAL**

(1) Disconnect the negative battery cable.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAIN COCK WITH THE SYSTEM HOT AND PRESSURIZED BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

(2) On right hand drive vehicles, drain the cooling system. Refer to Group 7, Cooling System for the procedure.

(3) Recover the air conditioning system, if equipped. Refer to Group 24, Heating and Air Conditioning for the procedure.

(4) Remove the A/C lines at the compressor and cap all openings. Refer to Group 24, Heating and Air Conditioning for the procedure. Remove the A/C line support bracket attached to cylinder head cover, and move the A/C, vacuum lines away from the cylinder head.

(5) Remove the generator support brace.

(6) Remove the Crankcase breather hose from the rear of the valve cover

(7) Remove the cylinder head cover bolts.

(8) Remove the cylinder head cover.

INSTALLATION

(1) Install the cylinder head cover. Torque the bolts to 15 N·m (133 in. lbs.).

(2) Connect the crankcase breather hose.

(3) Install the generator support brace. Torque bolt to 27 N·m (20 ft. lbs.) and nut to 11 N·m (8 ft. lbs.).

(4) Install the A/C lines on the compressor and install the support bracket on the cylinder head cover. Torque bolt to 7 N·m (62 in. lbs.).

(5) Connect the negative battery cable.

(6) If equipped with A/C, evacuate and charge the air conditioning system. Refer to Group 24, Heater and Air Conditioning.

(7) On right hand drive vehicles, fill the cooling system. Check for leaks.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(8) Operate the engine with the radiator cap off. Inspect for leaks and continue operating the engine until the thermostat opens. Add coolant, if required.

REMOVAL AND INSTALLATION (Continued)

HYDRAULIC TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending unit. The pressure should be between 4 bars (50 psi) at 3000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these 2 conditions could be responsible for noisy tappets:

OIL LEVEL HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

OIL LEVEL LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than 1 tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

HYDRAULIC TAPPETS**REMOVAL**

- (1) Disconnect the negative battery cable.
- (2) Discharge the air conditioning system, if equipped. Refer to Group 24, Heating and Air Conditioning for procedure.
- (3) If equipped with air conditioning, remove the A/C lines at the compressor and cap.
- (4) Remove the A/C line bracket attached to the cylinder head cover and move the lines away from the cylinder head.
- (5) Remove cylinder head cover. Refer to cylinder head cover removal and installation procedure in this section.
- (6) Remove the rocker assemblies and push rods. Refer to rocker arms and push rod removal and installation procedure in this section. Identify push rods to ensure installation in original location.
- (7) Remove cylinder head, intake manifold, and exhaust manifold. Refer to cylinder head removal and installation in this section.

**Fig. 25 Tappet And Rocker Arm Assembly**

- (8) Remove the tappet retainers (Fig. 26).

**Fig. 26 Tappet And Retainer**

- (9) Slide Hydraulic Tappet Remover/Installer Tool through opening in block and seat tool firmly in the head of tappet.

- (10) Pull the tappet out of the bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

CAUTION: The plunger and tappet bodies are not interchangeable. The plunger and valve must always be fitted to the original body. It is advisable to work on one tappet at a time to avoid mixing of parts. Mixed parts are not compatible. **DO NOT** disassemble a tappet on a dirty work bench.

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

- (1) Lubricate the tappets.
- (2) Install the tappets and retainers in their original positions. Ensure that the oil feed hole in the side of the tappet body faces up (away from the crankshaft).
- (3) Install the cylinder head, intake manifold, and exhaust manifold. Refer to cylinder head removal and installation in this section.
- (4) Install the push rods.
- (5) Install the rocker arms. Refer to rocker arms and push rod removal and installation in this section.
- (6) Install the cylinder head cover. Refer to cylinder head cover removal and installation in this section.
- (7) Connect the negative battery cable.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

- (8) Start and operate engine. Warm up to normal operating temperature.

ROCKER ARMS AND PUSH RODS

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Discharge the air conditioning system, if equipped. Refer to Group 24, Heating and Air Conditioning for procedure.
- (3) If equipped with air conditioning, remove the service valves and cap the compressor ports. Refer to Group 24, Heating and Air Conditioning.
- (4) Remove the generator bracket.
- (5) Remove the cylinder head cover. Refer to cylinder head cover removal and installation in this section.
- (6) Remove the rocker arm retaining nut (Fig. 27).
- (7) Remove the rocker assembly. Place them on a bench in the same order as removed.
- (8) Remove the push rods and place them on a bench in the same order as removed.

INSTALLATION

WARNING: During the installation of the rocker arm assemblies it is possible to cause valve interference between the piston and valve if the piston is near Top Dead Center (TDC). This is due to the slow bleed down rate of the tappets when adjusting the rocker arm assemblies. Follow the procedure below to ensure that engine damage does not occur.

- Install the rocker arm assemblies in the same order as removed.

Fig. 27 Rocker Arm Retaining Nut

- 1 – ROCKER ARM ASSEMBLY
- 2 – ROCKER ARM RETAINING NUTS
- 3 – ROCKER ARM SPRING PLATE

- Bring piston # 1 to Top Dead Center.
- Rotate the engine 40° counter clockwise and stop.
- At this point tighten all of the rocker arm nuts. Torque nuts to 27 N·m (20 ft. lbs.).

NOTE: You must allow 30 minutes before starting the engine once the rocker arms are torqued. This will allow the hydraulic tappets to stabilize and prevent the possibility of piston to valve contact.

- (2) Install the cylinder head cover. Refer to cylinder head cover removal and installation in this group.
- (3) Evacuate and charge the air conditioning system. Refer to Group 24, Heater and Air Conditioning.
- (4) Connect the negative battery cable.

VALVE SPRINGS

This procedure can be done with the engine cylinder head installed on the block.

REMOVAL

- (1) Disconnect the negative battery cable.
- Each valve spring is held in place by a retainer and a set of conical valve locks. The locks can be removed only by compressing the valve spring.
- (2) Remove the cylinder head cover. Refer to cylinder head cover removal and installation in this section.

REMOVAL AND INSTALLATION (Continued)

(3) Remove the rocker arms assemblies and push rods. Refer to rocker arm and push rod removal and installation in this section. Retain the push rods, and rocker arms assemblies in the same order and position as removed.

(4) Inspect the springs and retainer for cracks and possible signs of weakening.

(5) Install an air hose adaptor in the fuel injector hole.

(6) Connect an air hose to the adapter and apply air pressure slowly. Maintain at least 621 kPa (90 psi) of air pressure in the cylinder to hold the valves against their seats.

(7) Tap the retainer or tip with a rawhide hammer to loosen the lock from the retainer. Use Valve Spring Compressor Tool to compress the spring and remove the locks.

(8) Remove the valve spring and retainer.

(9) Inspect the valve stems, especially the grooves. An Arkansas smooth stone should be used to remove nicks and high spots.

INSTALLATION

(1) Install the valve spring and retainer.

(2) Compress the valve spring with Valve Spring Compressor Tool and insert the valve locks. Release the spring tension and remove the tool. Tap the spring from side-to-side to ensure that the spring is seated properly on the engine cylinder head.

(3) Disconnect the air hose. Remove the adaptor from the fuel injector hole and install the fuel injector.

(4) Repeat the procedures for each remaining valve spring to be removed.

(5) Install the push rods. Ensure the bottom end of each rod is centered in the plunger cap seat of the hydraulic valve tappet.

(6) Install the rocker arm assemblies, in their original locations. Torque nuts to 29.4 N·m (264 in. lbs.).

(7) Install the cylinder head cover. Refer to cylinder head cover removal and installation in this section.

(8) Connect the negative battery cable.

ENGINE CYLINDER HEAD

REMOVAL

(1) Disconnect the negative battery cable.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAIN COCK WITH THE SYSTEM HOT AND PRESSURIZED BECAUSE SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

(2) Drain the cooling system. Refer to Group 7, Cooling System for procedure.

(3) Discharge the air conditioning system, if equipped. Refer to Group 24, Heating and Air Conditioning for procedure.

(4) If equipped with air conditioning, remove the A/C lines at the compressor and cap. Refer to Group 24, Heating and Air Conditioning. Remove A/C line bracket attached to cylinder head cover, and move A/C lines away from cylinder head.

(5) Remove the air cleaner hose from turbocharger and breather hose.

(6) Remove the air cleaner assembly and breather hose.

(7) Remove the generator support bracket.

(8) Remove the upper radiator hose and coolant recovery hose.

(9) Remove the water manifold and recovery hose.

(10) Disconnect the heater hoses and coolant recover bottle hose.

Fig. 28 Turbocharger

- 1 - EGR TUBE
- 2 - EGR VALVE
- 3 - OIL FEED LINE
- 4 - OIL DRAIN
- 5 - TURBO

(11) Disconnect the EGR tube from EGR valve.

(12) Remove the EGR valve

(13) Remove the exhaust heat shield from exhaust manifold.

(14) Remove the exhaust heat shield from down pipe.

(15) Remove the exhaust down pipe from turbocharger (Fig. 28).

(16) Disconnect the oil feed line from turbocharger.

REMOVAL AND INSTALLATION (Continued)

(17) Disconnect the oil drain line from turbo-charger.

(18) Remove the Exhaust manifold. Refer to Group 11, Exhaust System and Turbocharger.

(19) Remove the Intake manifold. Refer to intake manifold removal and installation procedure in this section.

(20) Remove the oil feed line retaining bracket at rear of #4 cylinder head.

(21) Remove the oil feed line retaining bracket (Fig. 29).

Fig. 29 Oil Feed Line Retainer

- 1 - CYLINDER HEAD OIL SUPPLY LINE RETAINING CLIP
- 2 - EXHAUST MANIFOLD
- 3 - CYLINDER HEAD OIL SUPPLY LINE
- 4 - REAR OF CYLINDER HEADS
- 5 - CYLINDER HEAD COVER

(22) Remove the oil feed line for rocker arm assemblies (Fig. 30).

(23) Remove the Crankcase breather hose from rear of the valve cover

(24) Remove the injector sensor wire and the glow plug hot lead.

(25) Remove the fuel lines and fuel filter. Refer to Group 14, Fuel Systems for procedure.

(26) Remove the injector fuel lines from injectors to pump.

Fig. 30 Rocker Arm Oil Feed Lines

(27) Remove the fuel injectors with tool VM.1012 (Fig. 31). Refer to Group 14, Fuel System for procedure.

Fig. 31 Fuel Injector Tool VM.1012B

(28) Remove the engine cylinder head cover.

(29) Remove the rocker retaining nuts (Fig. 33).

(30) Remove the rocker arm assemblies. Place them on a bench in the same order as removed.

(31) Remove the push rods and place them on a bench in the same order as removed.

(32) Mark the cylinder head positions.

(33) Remove the engine cylinder head bolts with special tool VM.1018 and VM.1019.

(34) Remove the engine cylinder head and gasket.

(35) Stuff clean lint free shop towels into the cylinder bores.

CYLINDER HEAD GASKETS

A steel cylinder head gasket is used for all four cylinder heads.

Cylinder head gaskets are available in three thicknesses. Identification holes in the right front corner of the gasket indicate the thickness of the gasket (Fig. 34).

REMOVAL AND INSTALLATION (Continued)

80a13f92

Fig. 32 Fuel Injector

80a243c4

Fig. 33 Rocker Arm Retaining Nuts

- 1 - ROCKER ARM ASSEMBLY
- 2 - ROCKER ARM RETAINING NUTS
- 3 - ROCKER ARM SPRING PLATE

CAUTION: Piston protrusion must be measured, to determine cylinder head gasket thickness, if one or more cylinder wall liners have been replaced.

NOTE: If cylinder wall liners have not been removed; the same thickness head gasket removed, may be used.

HOLES OR NOTCHES
CAN BE LOCATED AT
THE RIGHT FRONT COR-
NER OF THE CYLINDER
BLOCK

HOW TO IDENTIFY GASKET THICKNESS

NO HOLES	1.41mm
2 HOLES	1.51mm
1 HOLE	1.61mm

80bfe1e6

**Fig. 34 Steel Type Cylinder Head Gasket—
identification**

MEASURING PISTON PROTRUSION

(1) Use special tool VM.1010 with dial indicator special tool VM.1013 (Fig. 35).

J9509-33

Fig. 35 Measuring Piston Protrusion

(2) Bring the piston of cylinder no. 1 exactly to top dead center.

(3) Zero the dial indicator on the cylinder block mating surface.

(4) Setup the dial indicator on the piston crown (above the center of the piston pin) 5mm (1/8 in.)

REMOVAL AND INSTALLATION (Continued)

from the edge of the piston and note the measurement (Fig. 36).

(5) Repeat the procedure with the rest of the cylinders.

(6) Establish the thickness of the steel gasket for all four cylinder heads on the basis of the greatest piston protrusion (Fig. 34).

Measured dimension (mm)	0.53 - 0.62
Cyl. head gasket thickness (mm)	1.41
Piston clearance (mm)	0.80 - 0.89
Measured dimension (mm)	0.63-0.72
Cyl. head gasket thickness (mm)	1.51
Piston clearance (mm)	0.80-0.89
Measured dimension (mm)	0.73-0.82
Cyl. head gasket thickness (mm)	1.61
Piston clearance (mm)	0.80-0.89

Fig. 36 Piston Protrusion Chart

CAUTION: Gaskets are to be installed DRY. DO NOT use a gasket sealing compound on the gasket.

INSTALLATION

(1) Remove the shop towels from the cylinder bores. Coat the bores with clean engine oil.

(2) Install cylinder head alignment studs VM.1009.

(3) After determining the correct head gasket thickness, clean the block and head mating surfaces,

place the engine cylinder head gasket over the alignment studs.

(4) Place the engine cylinder head over the alignment studs.

CAUTION: New cylinder head bolts should be used.

(5) Tighten the engine cylinder head bolts in sequence according to the following procedure (Fig. 37) :

a. The threads and underside heads of the bolts should be lubricated. Use the cylinder head alignment studs tool number VM-1009. Position the heads on the block and secure with the ten large center bolts (14mm) and spacers (clamps), finger tight only.

b. Ensure that the various clamps are installed correctly and the head gasket remains in it's proper position, completely covered. Then, lubricate and install the eight small bolts (12mm), also finger tight.

(6) Install the intake and exhaust manifolds with a new gasket, partially tightening the nuts to a maximum of 5 N·m (44 in. lbs.). This will align the heads. Refer to Group 11, Exhaust System and Turbo-charger for the proper procedure. Install lift eye and brake vacuum tube at this time.

(7) Then, tighten the 14mm bolts with special tool VM.1019 in the following manner:

(8) **1st Phase:** Tightening Head Bolts (Fig. 37). Central bolts (A-L): Tighten all bolts, starting with bolt H then G-F-E-D-C-B-A-L-I, to 30 N·m. Tighten all bolts an additional 70°, starting with bolt A and continuing in alphabetical order. Finally, tighten all bolts an additional 70°, starting again with bolt A and continuing in alphabetical order.

Fig. 37 Engine Cylinder Head Bolt Tightening Sequence

REMOVAL AND INSTALLATION (Continued)

(9) Tighten the 12mm bolts in the following manner:

(10) Side bolts (M1-M2): Tighten M1 bolts to 30 N·m, then rotate them 85° (±5). Tighten M2 bolts to 30 N·m, then rotate them 85° (±5).

NOTE: If vehicle is equipped with A/C do not install A/C lines to compressor and charge A/C till Phase 2 is complete.

(11) **2nd Phase:** After 20 minutes of engine operation at operating temperature, allow engine to cool down completely. Then retorque the head bolts as follows:

(12) Central bolts A-L: Completely back off bolts one-by-one and then retighten to 30 N·m plus 130° (±5°). Then proceed in the same way, bolt by bolt, following alphabetical order, as indicated.

(13) Side bolts M1-M2: **Without slackening**, torque bolts M1 then bolts M2 to 90 N·m (66 ft. lbs.).

(14) Torque intake nuts to 32 N·m (24 ft. lbs.) and exhaust manifolds nuts to 32 N·m (24 ft. lbs.) after completing the cylinder head torquing procedure.

(15) Install the oil feed lines for the rocker arm assemblies. Torque oil feed lines to 13 N·m (115 in. lbs.).

(16) Install the oil feed line retaining bracket at rear of #4 cylinder head (Fig. 29).

(17) Install the push rods and rocker arm assemblies. Refer to the rocker arm and pushrod removal and installation procedure in this group.

(18) Install the cylinder head cover. Torque bolts to 15 N·m (133 in. lbs.).

(19) Connect the crankcase breather hose.

(20) Connect the injector sensor wire and the glow plug hot lead.

(21) Install the turbocharger oil feed line. Torque banjo bolts to 27 N·m (20 ft. lbs.).

(22) Install the turbocharger oil drain line. Torque bolts to 11 N·m (97 in. lbs.).

(23) Install the water manifold. Torque bolts to 12 N·m (106 in. lbs.).

(24) Install the generator support bracket.

(25) Raise the vehicle on hoist.

(26) Install the exhaust down pipe to turbocharger, tighten bolts to 22 N·m (16 ft. lbs.).

(27) Install the exhaust down pipe heat shield.

(28) Install the exhaust heat shield, Tighten bolts to 11 N·m (8 ft. lbs.).

(29) Install the EGR valve to intake manifold, tighten bolts to 27 N·m (20 ft. lbs.).

(30) Install the EGR tube to EGR valve, tighten bolts to 27 N·m (20 ft. lbs.).

(31) Install the lower charge air cooler hose to turbocharger.

(32) Install the air cleaner assembly and hose.

(33) Install the oil breather hose to air cleaner hose.

(34) Install the upper charge cooler hose to turbocharger.

(35) Connect the recover bottle hose to water manifold.

(36) Install the fuel injectors using special tool VM.1012. Refer to Group 14, Fuel System for procedures.

(37) Install the fuel injector lines from the pump to injectors. Torque nuts to 19 N·m (14 ft. lbs.).

(38) Connect the A/C lines to compressor and install bracket on cylinder head cover, if equipped with air conditioning.

(39) Install the fuel filter, Tighten bolts to 28 N·m (250 in. lbs.).

(40) Connect the fuel supply and return lines

(41) Connect the upper radiator hose.

(42) Connect the negative cable battery.

(43) If equipped with A/C, evacuate and charge the air conditioning system. Refer to Group 24, Heater and Air Conditioning.

(44) Fill the cooling system. Check for leaks.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(45) Operate the engine with the radiator cap off. Inspect for leaks and continue operating the engine until the thermostat opens. Add coolant, if required.

NOTE: After rebuild or cylinder head gasket replacement, the cylinder head must be retorqued within the first 20,000km. If individual fiber type head gaskets were used.

NOTE: The one piece steel type head gasket does not require, the above mentioned, retorque procedure.

CYLINDER HEAD RE-TORQUE

Within the first 20,000 km (12,000 miles) after rebuild, retorque the cylinder head bolts as follows: (Fig. 37) Central bolts A-L: Without slackening the bolts, following alphabetical order tighten the bolts through an angle of 15°. Side bolts M1-M2: Without slackening, tighten M1 then M2 bolts through an angle of 15°.

REMOVAL AND INSTALLATION (Continued)

VIBRATION DAMPER

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Remove the fan and set fan inside fan shroud then remove fan shroud and fan as an assembly.
- (3) Remove the accessory drive belt. Refer to Group 7, Cooling System for procedure.
- (4) Remove the vibration damper nut.
- (5) Install special tool VM.1000-A to remove vibration damper.

INSTALLATION

- (1) Install the vibration damper and align with key way.
- (2) Install the vibration damper nut. Torque nut to 196 N·m (147 ft. lbs.).
- (3) Install the accessory drive belt. Refer to Group 7, Cooling System for procedure.
- (4) Connect the negative battery cable.

TIMING GEAR COVER OIL SEAL

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Remove the vibration damper. Refer to vibration damper removal and installation in this section.

CAUTION: Use care when removing the old seal. Be sure not to damage the timing gear cover.

- (3) Pry out the old seal.

INSTALLATION

Remove the oil seal ring. The seating diameter must be 68.000 - 68.030 mm.

- (1) Install the new seal using special tool VM.1015A.
- (2) Install the vibration damper. Refer to vibration damper removal and installation in this section.
- (3) Connect the negative battery cable.

TIMING GEAR COVER

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Remove the fan and set fan inside fan shroud then remove fan shroud and fan as an assembly.
- (3) Remove the accessory drive belt. Refer to Group 7, Cooling System for procedure.
- (4) Remove the vibration damper nut.
- (5) Install special tool VM.1000-A to remove the vibration damper.
- (6) Remove the fan pulley.

NOTE: The idler pulley bolt has left hand thread.

J9509-4

Fig. 38 Timing Gear Cover Oil Seal

- (7) Remove the idler pulley and bracket.
- (8) Remove the automatic belt tensioner.
- (9) Remove the Power steering pump pulley.
- (10) Remove the timing gear retaining bolts and cover.

INSTALLATION

- (1) Be sure the mating surfaces of the gear case cover and the cylinder block are clean and free from burrs.
- (2) Apply a continuous 3 mm bead of Silicone Sealer (Fig. 39) to timing cover, install within 10 minutes, tighten bolts to 10.3 N·m (91 in. lbs).

J9509-7

Fig. 39 Front Cover Sealer Location

1 - MOPAR SILICONE RUBBER ADHESIVE SEALANT

- (3) Install Power steering pump pulley. Torque bolts to 166 N·m.

REMOVAL AND INSTALLATION (Continued)

- (4) Install the automatic belt tensioner.

NOTE: The idler pulley has left hand thread.

- (5) Install the idler pulley. Torque nut to 40 N·m (29 ft. lbs.).
 (6) Install the fan pulley. Torque bolts to 56 N·m (41 ft. lbs.).
 (7) Install the vibration damper. torque nut to 196 N·m (147 ft. lbs.).
 (8) Install the accessory drive belt. Refer to Group 7, Cooling System for procedure).
 (9) Install the fan and fan shroud.
 (10) Connect the negative battery cable.

CAMSHAFT

REMOVAL

J9509-173

Fig. 40 Camshaft Assembly

- (1) Disconnect the negative battery cable.
 (2) Remove the cylinder head cover. Refer to cylinder head cover removal and installation in this section.
 (3) Remove the cylinder heads. Refer to cylinder head removal and installation in this section.
 (4) Remove the rocker arm assemblies, push rods, and hydraulic tappets. Refer to the respective groups in this section.
 (5) Remove the fan and set fan inside fan shroud then remove fan shroud and fan as an assembly.
 (6) Remove the accessory drive belt. Refer to Group 7, Cooling System for procedure.
 (7) Remove the radiator. Refer to Group 7, Cooling System for procedure.
 (8) Remove the A/C condenser. Refer to Group 24, Heating and Air Conditioning for procedure.
 (9) Remove the vibration damper. Refer to vibration damper removal and installation in this section.
 (10) Remove the power steering pump pulley.

- (11) Remove timing gear cover. Refer to timing gear cover removal and installation in this section.

- (12) Rotate the engine to align the timing marks as shown (Fig. 41).

80ae8446

Fig. 41 Timing Marks

- 1 - VACUUM PUMP
 2 - CAMSHAFT
 3 - INJECTION PUMP
 4 - TIMING MARKS
 5 - OIL PUMP
 6 - CRANKSHAFT

- (13) Unscrew the flange bolts and remove camshaft (Fig. 42).

THRUST PLATE INSPECTION

Check the thickness (Fig. 43) of the plate at points a-b-c-d. If the measurement is not between 3.950 - 4.050 it must be changed.

INSTALLATION

- (1) Coat the camshaft journals with clean engine oil and carefully install the camshaft complete with thrust plate and gear. Tighten retaining bolts to 27.5 N·m (20 ft. lbs.) torque. Be sure to align the timing marks as shown (Fig. 44).
 (2) Install the hydraulic tappets and retainers. Refer to hydraulic tappet removal and installation in this section.
 (3) Install the cylinder heads. Refer to cylinder head removal and installation in this section).
 (4) Install the push rods and rocker arm assemblies. Refer to the respective sections.

REMOVAL AND INSTALLATION (Continued)

J9509-15

Fig. 42 Camshaft Removal

J9509-16

Fig. 43 Camshaft Thrust Plate

(5) Install the cylinder head cover. Refer to cylinder head cover removal and installation in this section.

(6) Install the timing gear cover. Refer to timing gear cover removal and installation in this section.

(7) Install the vibration damper. Refer to the vibration damper removal and installation in this section.

(8) Install the A/C condenser. Refer to Group 24, Heating and Air Conditioning for procedure.

(9) Install the radiator. Refer to Group 7, Cooling System for procedure.

(10) Install the fan and fan shroud. Torque fan to 56 N·m (41 ft. lbs.).

80ae8458

Fig. 44 Timing Marks

- 1 - CAMSHAFT GEAR
- 2 - CRANKSHAFT GEAR
- 3 - OIL PUMP
- 4 - VACUUM PUMP

(11) If equipped, evacuate and charge the air conditioning system. Refer to Group 24, Heater and Air Conditioning for procedure.

(12) Connect the negative battery cable.

(13) Fill the cooling system. Check for leaks.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN DIRECT LINE WITH THE FAN. DO NOT PUT HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(14) Operate the engine with the radiator cap off. Inspect for leaks and continue operating the engine until the thermostat opens. Add coolant, if required.

CAMSHAFT BEARINGS

This procedure requires that the engine is removed from the vehicle.

REMOVAL

(1) With the engine completely disassembled, remove camshaft rear plate and o-ring.

(2) Install the proper size adapters and horseshoe washers (part of Crankshaft Bearing Remover/Installer Tool VM-1002) at back of each bearing shell. Drive out the bearing shells.

INSTALLATION

(1) Install the new camshaft bearings with Camshaft Bearing Remover/Installer Tool C3131-A by

REMOVAL AND INSTALLATION (Continued)

sliding the new camshaft bearing shell over proper adapter.

(2) Position the rear bearing in the tool. Install horseshoe lock and by reversing removal procedure, carefully drive bearing shell into place.

(3) Install the remaining bearings in the same manner. **The Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly.**

(4) Install a new rear plate o-ring at the rear of camshaft. **Be sure this seal does not leak.**

OIL PAN

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Raise the vehicle on hoist.
- (3) Drain the oil.
- (4) Remove the oil pan lower cover (Fig. 45).
- (5) Remove the bolts from oil pan. Remove the 6 bolts that are on the inside of the oil pan.
- (6) Remove the oil pan.

Fig. 45 Oil Pan

- 1 - LOWER OIL PAN COVER
2 - OIL DRAIN PLUG

INSTALLATION

(1) Remove all gasket material from cylinder block. Be careful not gouge or scratch aluminum pan sealing surface.

(2) Apply a continuous 3 mm bead of Silicone Sealer to oil pan, install within 10 minutes. Install the oil pan.

(3) Install the inside oil pan bolts. Torque bolts to 11 N·m (8 ft. lbs.).

(4) Torque the smaller oil pan bolts to 11 N·m (8 ft. lbs.). Torque the larger oil pan bolts to 25 N·m (18 ft. lbs.).

(5) Install the oil drain plug. Torque to 79 N·m (58 ft. lbs.).

(6) Lower the vehicle from hoist.

(7) Fill engine with proper amount of oil.

(8) Connect the negative battery cable.

OIL PUMP

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Remove the timing gear cover. Refer to timing gear cover removal and installation in this section.
- (3) Remove the oil pump (Fig. 46).

80ae8458

Fig. 46 Oil Pump Removal

- 1 - CAMSHAFT GEAR
2 - CRANKSHAFT GEAR
3 - OIL PUMP
4 - VACUUM PUMP

INSTALLATION

(1) Install new O-ring and lubricate with clean engine oil.

(2) Install the oil pump. Torque screws to 27.5 N·m (20 ft. lbs.). Check for normal backlash between pump and crankshaft gears.

(3) Install the timing gear cover. Refer to timing gear cover removal and installation in this section.

INTERNAL VACUUM PUMP

REMOVAL

- (1) Disconnect the negative battery cable.

REMOVAL AND INSTALLATION (Continued)

(2) Remove the timing gear cover. Refer to timing gear cover removal in this section.

(3) Align all the timing marks before removing the vacuum pump (Fig. 47).

Fig. 47 Timing Marks

- 1 - VACUUM PUMP
- 2 - CAMSHAFT
- 3 - INJECTION PUMP
- 4 - TIMING MARKS
- 5 - OIL PUMP
- 6 - CRANKSHAFT

- (4) Remove the vacuum pump retaining bolts..
- (5) Remove the internal vacuum pump.

INSTALLATION

(1) To install the vacuum pump, align with timing marks on gear set and install (Fig. 47). Torque bolts to 27.5 N·m (20 ft. lbs.).

(2) Install the timing gear cover. Refer to timing gear cover removal in this section.

(3) Connect the negative battery cable.

OIL PUMP PRESSURE RELIEF VALVE

REMOVAL

- (1) Disconnect the negative battery cable
- (2) Remove the oil pan. Refer to oil pan removal and installation procedure in this section.
- (3) Remove the relief valve snap ring.
- (4) Remove the relief valve cap, spring, and plunger (Fig. 51).

(5) Check the relief valve spring length. Relief valve spring free length is 57.5mm (2.263 in.). If

Fig. 48 Vacuum Pump

- 1 - VACUUM PUMP
- 2 - CAMSHAFT
- 3 - OIL PUMP
- 4 - CRANKSHAFT

Fig. 49 Vacuum Pump Parts

- 1 - O-RING
- 2 - ROTOR BLADES
- 3 - VACUUM PUMP

spring length is less or spring is distorted it must be replaced.

REMOVAL AND INSTALLATION (Continued)

Fig. 50 Vacuum Pump Mounting Hole

- (6) Check the plunger for scoring, replace if necessary.

Fig. 51 Oil Pressure Relief Valve

INSTALLATION

- (1) Thoroughly clean all components and relief valve pocket in cylinder block.
- (2) Fit plunger, spring and cap into block.
- (3) Compress spring and install the snap ring. Ensure the snap ring is completely seated in groove.
- (4) Install the oil pan. Refer to oil pan removal and installation procedure in this section.

- (5) Connect the negative battery cable.

OIL FILTER ADAPTER AND ENGINE OIL COOLER

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Remove the oil filter.
- (3) Remove the oil filter adapter/oil cooler retaining bolt (Fig. 52).
- (4) Remove the oil filter adapter.
- (5) Disconnect the engine oil cooler coolant hoses and remove the oil cooler.

Fig. 52 Oil Filter Adapter and Engine Oil Cooler

- 1 - OIL FILTER ADAPTER
- 2 - ENGINE BLOCK
- 3 - O-RING
- 4 - ENGINE OIL COOLER
- 5 - O-RING
- 6 - OIL FILTER

INSTALLATION

- (1) Connect the engine oil cooler coolant hoses.
- (2) Install a new o-ring on the oil cooler.
- (3) Install the oil filter adapter to the engine oil cooler with a new o-ring using the oil filter adapter/oil cooler retaining bolt (Fig. 52). Torque bolt to 69 N·m (51 ft. lbs.).
- (4) Install the oil filter and add oil.
- (5) Connect the negative battery cable.

PISTONS AND CONNECTING ROD ASSEMBLY

REMOVAL

- (1) Disconnect the battery cable.

REMOVAL AND INSTALLATION (Continued)

(2) Remove cylinder heads, refer to cylinder head removal in this section.

(3) Raise vehicle on host.

(4) Remove oil pan, refer to oil pan removal in this section.

(5) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation.** Mark piston with matching cylinder number.

(6) Pistons and connecting rods must be removed from top of cylinder block. Rotate crankshaft so that each connecting rod is centered in cylinder bore.

(7) Remove connecting rod cap. Install connecting rod bolt protectors on connecting rod bolts. Push each piston and rod assembly out of cylinder bore.

NOTE: Be careful not to nick crankshaft journals.

(8) After removal, install bearing cap on the mating rod.

Fig. 53 Piston Assembly

PISTON PIN—REMOVAL

- (1) Secure connecting rod in a soft jawed vice.
- (2) Remove 2 clips securing piston pin.
- (3) Push piston pin out of piston and connecting rod.

PISTON RING—REMOVAL

Fig. 54 Piston Rings—Removing and Installing

- (1) ID mark on face of upper and intermediate piston rings must point toward piston crown.
- (2) Using a suitable ring expander, remove upper and intermediate piston rings (Fig. 54).
- (3) Remove the upper oil ring side rail, lower oil ring side rail and then oil ring expander from piston.
- (4) Carefully clean carbon from piston crowns, skirts and ring grooves ensuring the 4 oil holes in the oil control ring groove are clear.

PISTON RING FITTING

- (1) Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 in.) from bottom of cylinder bore. Check gap with feeler gauge. Top compression ring gap .25 to .50mm (.0098 to .0196 in.). Second compression ring gap .25 to .35mm (.0098 to .0137 in.). Oil control ring gap .25 to .58mm (.0098 to .0228 in.).
- (2) If ring gaps exceed dimension given, new rings or cylinder liners must be fitted. Keep piston rings in piston sets.
- (3) Check piston ring to groove clearance (Fig. 56). Top compression ring gap .08 to .130mm (.0031 to .0051 in.). Second compression ring gap .070 to .102mm (.0027 to .0040 in.). Oil control ring gap .040 to .072mm (.0015 to .0028 in.).

PISTON RINGS—INSTALLATION

- (1) Install rings on the pistons using a suitable ring expander (Fig. 57).
- (2) Top compression ring is tapered and chromium plated. The second ring is of the scraper type and must be installed with scraping edge facing bottom of the piston. The third is an oil control ring. Ring gaps must be positioned, before inserting piston into the liners, as follows (Fig. 59).

REMOVAL AND INSTALLATION (Continued)

**Fig. 55 Ring Gap Measurement**

1 - FEELER GAUGE

**Fig. 56 Piston Ring to Groove Clearance**

(3) Top ring gap must be positioned at 30 degrees to the right of the combustion chamber recess (looking at the piston crown from above).

(4) Second piston ring gap should be positioned on the opposite side of the combustion chamber recess.

(5) Oil control ring gap to be located 30 degrees to the left of combustion chamber recess.

(6) When assembling pistons check that components are installed in the same position as before disassembly, determined by the numbers stamped on the crown of individual pistons. Engine cylinders are numbered starting from gear train end of the engine. **Face chamber recess side of piston towards camshaft.** Therefore, the numbers stamped on con

**Fig. 57 Piston Rings—Removing and Installing****Fig. 58 Piston Ring Identification**

rod big end should also face in the same direction. To insert piston into cylinder use a ring compressor as shown in (Fig. 57).

PISTON PIN INSTALLATION

- (1) Secure connecting rod in soft jawed vice.
- (2) Lubricate piston pin and piston with clean oil.
- (3) Position piston on connecting rod.

CAUTION: Ensure combustion recess in piston crown and the bearing cap numbers on the connecting rod are on the same side.

- (4) Install piston pin.
- (5) Install clips in piston to retain piston pin.
- (6) Remove connecting rod from vice.

INSTALLATION

(1) Before installing pistons, and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap (Fig. 59).

REMOVAL AND INSTALLATION (Continued)

80bce8f2

Fig. 59 Piston Ring Gap Location

(2) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located as shown in (Fig. 59).

J9509-25

Fig. 60 Installing Piston

(3) Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston and tighten with the special wrench (Fig. 60). **Ensure position of rings does not change during this operation.**

(4) Face chamber recess side of piston towards camshaft.

NOTE: Be careful not to nick crankshaft journals.

(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

(7) Install rod caps. Install rod bolts and tighten to 29 N·m (21 ft. lb.) plus 60°.

CYLINDER WALL LINER ASSEMBLY

REMOVAL

- (1) Remove cylinder heads.
- (2) Remove Oil pan.
- (3) Remove pistons.
- (4) Use tool VM-1001 to remove liners (Fig. 61).

J9509-12

Fig. 61 Liner Removal Tool

(5) Remove shims from cylinder liner or cylinder block recess. Keep shims with each cylinder liner.

INSTALLATION

(1) Carefully clean residual LOCTITE from liner and crankcase, and degrease the crankcase where it comes into contact with the liners. Install the liners in the crankcase as shown (A), rotating them back and forth by 45° in order to guarantee correct positioning (Fig. 63).

(2) Measure the liner recess relative to block deck with a dial indicator mounted on a special tool

REMOVAL AND INSTALLATION (Continued)

J9509-13

Fig. 62 Liner Inspection

VM-1010 A. **All the measurements must be taken on camshaft side.** Zero dial gauge on block deck.

(3) Move dial gauge to cylinder liner record reading on dial gauge.

(4) Remove liner and special tool.

(5) Then select the correct shim thickness to give proper protrusion (0.01 - 0.06 mm).

(6) Fit the shim and the O-rings onto the liner.

(7) Lubricate the lower liner location in the block. Apply LOCTITE AVX to the corner of the liner seat. Apply LOCTITE AVX uniformly to the upper part of the liner at area.

(8) Fit the liners in the crankcase making sure that the shim is positioned correctly in the seat. Lock the liners in position using special tool (VM-1016) and bolts (Fig. 64). Clean the residual LOCTITE on the upper surface of the block deck.

(9) Recheck the liner protrusion. It should be 0.01 - 0.06 mm.

NOTE: A period of six hours must elapse between the liners being installed and engine start-up. If engine assembly is not continued after liner installation, the liners need to be clamped for twelve hours minimum.

J9509-120

Fig. 63 Liner Installation

REMOVAL AND INSTALLATION (Continued)

VM920970

Fig. 64 Liner Clamp Location**CRANKSHAFT MAIN BEARINGS****REMOVAL**

- (1) Disconnect the negative battery cable.
- (2) Remove the engine from vehicle. Refer to engine removal and installation in this section.

- (3) Install the engine on an engine stand.
- (4) Remove the accessory drive system.
- (5) Remove the cylinder head cover. Refer to cylinder head cover removal and installation in this section.
- (6) Remove the rocker arm assemblies and push rods. Refer to rocker arm and push rod removal and installation in this section.
- (7) Remove the intake manifold, exhaust manifold and turbocharger. Refer to Group 11, Exhaust System and Turbocharger.
- (8) Remove the water manifold.
- (9) Remove the oil feed lines to rocker arms.
- (10) Remove the cylinder heads. Refer to cylinder head removal and installation in this section.
- (11) Remove the oil pan and oil pick-up.
- (12) Remove the pistons and connecting rods.
- (13) Remove the vibration damper. Refer to vibration damper removal and installation in this section.
- (14) Remove the timing gear cover. Refer to timing gear cover removal and installation in this section.
- (15) Remove the oil pump and vacuum pump from block.
- (16) Install special tool VM.1004 onto crankshaft over gear (Fig. 66).
- (17) Remove the main bearing oil feed and crankshaft carrier locators from block.
- (18) Remove the flywheel and adaptor plate from engine block.
- (19) Remove the thrust bearings from rear main bearing carrier.
- (20) Slide the crankshaft and bearing carriers rearward to rear of block. If you encounter difficulty in removing the complete assembly as previously described, slide the assembly rearward sufficiently to gain access to the main bearing carrier bolts. Mark

J9509-178

Fig. 65 Crankshaft and Bearing Assembly

REMOVAL AND INSTALLATION (Continued)

**Fig. 66 Crankshaft Special Tool VM.1004**

1 - TOOL

the carriers for assembly and remove the bolts, two for each carrier (Fig. 67).

**Fig. 67 Crankshaft Support Locator Bolts**

(21) Separate the two halves of each carrier, remove from the crankshaft and temporarily re-assemble the carriers (Fig. 68). Withdraw the crankshaft through the rear of the crankcase.

INSTALLATION

- (1) Fit the main bearing supports together. Torque to 44 N·m (32 ft. lbs.)
- (2) Check internal diameter of bearings.
- (3) If internal diameter of original bearing is being checked and figures are not within specifications, new bearings must be used.

**Fig. 68 Crankshaft and Carrier Bearing Assembly**

(4) Check the crankshaft main bearing journals to bearing clearances. Clearances of main bearings is .03 to .088mm (.0011 to .0035 in.).

NOTE: Assemble engine according to sequence described, thus saving time and preventing damages to engine components. Clean parts with a suitable solvent and dry them with compressed air before assembly. Use new gaskets where applicable and torque wrenches for correct tightening of components.

(5) Thoroughly clean crankcase and oil passages, and blow dry with compressed air.

(6) Install new main bearing shells in each of the carrier halves. Assemble the carriers to the crankshaft journals, ensuring that the carriers are installed in their original locations and that the **piston jet notch is towards the front of the crankshaft**. Secure each carrier with the two bolts tightening evenly to 44 N·m (32 ft. lbs.). Check that the oil jet is in position (Fig. 68).

(7) Slide special tool VM.1004 over the crankshaft gear and, insert the crankshaft and carrier assembly into the crankcase in the same manner used for removal.

(8) Align the holes in the lower supports, with the center of the crankcase webs (Fig. 69).

(9) Secure each support assembly to the crankcase with the main bearing oil feed and support locators. Torque to 54 N·m (40 ft. lbs.).

(10) Install the rear main bearing support onto crankshaft ensuring arrow on bearing support aligns with vertical web in center of crankcase.

REMOVAL AND INSTALLATION (Continued)

VM920942

Fig. 69 Main Bearing Support Alignment

- (11) Install the rear oil seal.
- (12) Install the new O-rings in adaptor plate.
- (13) Install the adaptor plate to block. Torque nuts to 26.5 N·m (20 ft. lbs.).
- (14) Install the Allen bolts through adaptor plate to rear main bearing support. Torque to 11 N·m (97 in. lbs.).
- (15) Position the flywheel and O-ring on crankshaft and align bolt holes.

NOTE: For purposes of checking crankshaft end play, used flywheel bolts may be used. Final assembly requires new flywheel bolts.

- (16) Install 2 flywheel bolts, 180° apart, and tighten bolts to 20 N·m plus 60° (15 ft. lbs.) plus 60°.
- (17) Attach dial indicator to engine block.
- (18) Move crankshaft toward front of engine and zero indicator.
- (19) Move crankshaft toward the rear of engine and record measurement.
- (20) Subtract specified crankshaft end play from figure obtained. Crankshaft end play .153 to .304mm (.0060 to .0119 in.).
- (21) Select thrust washers which will give correct end play.
- (22) Remove tools and flywheel.
- (23) Lubricate thrust washer halves and fit them into the rear main bearing carrier.
- (24) Ensure that crankshaft end and flywheel mating surfaces are clean and dry. Install "O" ring in flywheel groove.

(25) To verify correct end play, install 2 flywheel bolts 180° apart, and tighten bolts to 20 N·m plus 60° (15 ft. lbs. plus 60°).

(26) Measure crankshaft end play with a dial gauge. Crankshaft end play should not exceed .153 to .304mm (.0060 to .0119 in.) (Fig. 70).

J9509-20

Fig. 70 Measuring Crankshaft End Play

CAUTION: Use NEW flywheel bolts for the following procedure.

(27) Install a new O-ring on flywheel. Install flywheel on crankshaft. The 6 flywheel bolts must be tightened as follows:

- a. Lubricate and install the 6 new flywheel bolts.
- b. Torque the 6 flywheel bolts to 49 N·m (36 ft. lbs.) starting one bolt and following with the opposite one (cross tightening) until completion, in a clockwise direction..
- c. Loosen one bolt at a time and tighten to 19.6 N·m (14 ft. lbs.) plus 75° using the cross tightening method.

(28) Install the pistons and connecting rod assemblies. Refer to piston and connecting rods removal and installation in this section.

(29) Install the oil pick up tube. Torque bolts to 25 N·m (18 ft. lbs.).

(30) Install the oil pan. Refer to oil pan removal and installation in this section.

(31) Install the vacuum pump, being careful to align the gear timing marks with those on the crankshaft gear. Torque screws to 20 N·m (15 ft. lbs.).

(32) Before installing the oil pump check pump bore depth in block (A) and pump body height (B) (Fig. 71). Difference between A and B should be 0.020-0.082 mm (.0007 to .0032 in.).

(33) Install the oil pump. Torque screws to 27 N·m (20 ft. lbs.). Check for normal backlash between pump and crankshaft gears.

(34) Install the timing gear cover. Refer to timing gear cover removal and installation in this section.

REMOVAL AND INSTALLATION (Continued)

J9509-8

Fig. 71 Oil Pump Bore Depth

(35) Install the vibration damper. Refer to vibration damper removal and installation in this section.

(36) Install the cylinder heads. Refer to cylinder head removal and installation in this section.

(37) Install the rocker arms and push rods. Refer to rocker arm and push rod removal and installation in this section.

(38) Install the cylinder head cover. Refer to cylinder head cover removal and installation in this section.

(39) Install the accessory drive system.

(40) Install the engine in vehicle. Refer to engine removal and installation in this section.

(41) Fill engine with the correct amount of fluids specified.

(42) Connect the negative battery cable.

DISASSEMBLY AND ASSEMBLY

HYDRAULIC TAPPETS

DISASSEMBLE

(1) Pry out plunger retainer spring clip.

(2) Clean varnish deposits from inside of tappet body above plunger cap.

(3) Invert tappet body and remove plunger cap, plunger, check valve, check valve spring, check valve retainer and plunger spring. Check valve could be flat or ball.

ASSEMBLE

(1) Clean all tappet parts in a solvent that will remove all varnish and carbon.

(2) Replace tappets that are unfit for further service with new assemblies.

(3) If plunger shows signs of scoring or wear, install a new tappet assembly. If valve is pitted, or valve seat on end of plunger is prevented from seating, install a new tappet assembly.

(4) Assemble tappets.

CLEANING AND INSPECTION

CYLINDER HEAD

CLEANING

Thoroughly clean the engine cylinder head and cylinder block mating surfaces. Clean the intake and exhaust manifold and engine cylinder head mating surfaces. Remove all gasket material and carbon.

Check to ensure that no coolant or foreign material has fallen into the tappet bore area.

Remove the carbon deposits from the combustion chambers and top of the pistons.

INSPECTION

Use a straightedge and feeler gauge to check the flatness of the engine cylinder head and block mating surfaces (Fig. 72).

Minimum cylinder head thickness 89.95mm (3.541 in.)

CAUTION: If only one cylinder head is found to be distorted and requires machining, it will also be necessary to machine the remaining cylinder heads and end plates by a corresponding amount to maintain correct cylinder alignment.

J9509-167

Fig. 72 Checking Cylinder Head Flatness

ROCKER ARMS AND PUSH RODS

CLEANING

Clean all the components (Fig. 73) with cleaning solvent.

CLEANING AND INSPECTION (Continued)

**Fig. 73 Rocker Arm Components**

- 1 - ROCKER ARM
- 2 - SPRING PLATE
- 3 - ROCKER SUPPORT
- 4 - PUSH ROD
- 5 - HYDRAULIC TAPPET
- 6 - CAMSHAFT
- 7 - ANTIROTATION BRACKET

Use compressed air to blow out the oil passages in the rocker arms and push rods.

INSPECTION

Inspect the pivot surface area of each rocker arm. Replace any that are scuffed, pitted, cracked or excessively worn.

Inspect the valve stem tip contact surface of each rocker arm and replace any rocker arm that is deeply pitted.

Inspect each push rod end for excessive wear and replace as required. If any push rod is excessively worn because of lack of oil, replace it and inspect the corresponding hydraulic tappet for excessive wear.

Inspect the push rods for straightness by rolling them on a flat surface or by shining a light between the push rod and the flat surface.

A wear pattern along the length of the push rod is not normal. Inspect the engine cylinder head for obstruction if this condition exists.

PISTONS AND CONNECTING ROD ASSEMBLY**INSPECTION—PISTONS**

(1) Piston Diameter: Size: 91.93-91.94mm (3.6191-3.6196 in.) Maximum wear limit .05mm (.0019 in.).

(2) Check piston pin bores in piston for roundness. Make 3 checks at 120° intervals. Maximum out of roundness .05mm (.0019 in.).

(3) The piston diameter should be measured approximately 15 mm (.590 in.) up from the base.

(4) Skirt wear should not exceed 0.1 mm (.00039 in.).

(5) The clearance between the cylinder liner and piston should not exceed 0.25 mm (.0009 in.).

(6) Make sure the weight of the pistons does not differ by more than 5 g.

INSPECTION—CONNECTING ROD

(1) Assemble bearing shells and bearing caps to their respective connecting rods ensuring that the serrations on the cap and reference marks are aligned.

(2) Tighten bearing cap bolts to 29N·m (21 ft. lbs.) plus 60°.

(3) Check and record internal diameter of crank end of connecting rod.

NOTE: When changing connecting rods, all four must have the same weight and be stamped with the same number. Replacement connecting rods will only be supplied in sets of four.

Connecting rods are supplied in sets of four since they all must be of the same weight category. Max allowable weight difference is 18 gr.

NOTE: On one side of the big end of the con-rod there is a two-digit number which refers to the weight category. On the other side of the big end there is a four digit number on both the rod and the cap. These numbers must both face the camshaft as well as the recess on the piston crown (Fig. 75). Lightly heat the piston in oven. Insert piston pin in position and secure it with provided snap rings.

The Four digit numbers marked on con rod big end and rod cap must be on the same side as the camshaft (Fig. 75). After having coated threads with Molyguard, tighten con rod bolts to 29 N·m (21 ft. lbs.) plus 60°.

INSPECTION—PISTON PIN

(1) Measure the diameter of piston pin in the center and both ends.

(2) Piston pin diameter is 29.990 to 29.996mm (1.1807 to 1.1809 in.).

CLEANING AND INSPECTION (Continued)

J9509-24

Fig. 74 Connecting Rod Identification

- 1 - CAMSHAFT SIDE
- 2 - 2-DIGIT NUMBER FOR WEIGHT CATEGORY
- 3 - 4-DIGIT REFERENCE NUMBERS FOR CORRECT ASSEMBLING

J9509-21

Fig. 75 Piston and Connecting Rod Assembly**INSPECTION—CRANKSHAFT JOURNALS**

(1) Using a micrometer, measure and record crankshaft connecting rod journals, take reading of each journal 120° apart. Crankshaft journal diameter is 53.84 to 53.955mm (2.1196 to 2.1242 in.).

(2) Crankshaft journals worn beyond limits or show signs of out of roundness must be reground or replaced. Minimum reground diameter is 53.69mm (2.1137 in.).

BEARING-TO-JOURNAL CLEARANCE

Compare internal diameters of connecting rod with crankshaft journal diameter. Maximum clearance between connecting rod and crankshaft journals .022 to .076mm (.0008 to .0029 in.).

J9509-39

Fig. 76 Bearing Clearance**CYLINDER WALL LINER ASSEMBLY****INSPECTION**

The cylinder walls should be checked for out-of-round and taper with dial bore gauge. The cylinder bore out-of-round is 0.100 mm (.0039 inch) maximum and cylinder bore taper is 0.100 mm (0.0039 inch) maximum. If the cylinder walls are badly scuffed or scored, new liners should be installed and honed, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B (Fig. 77). Top measurement should be 10 mm (3/8 inch) down and bottom measurement should be 10 mm (3/8 inch.) up from bottom of bore.

J9509-13

Fig. 77 Liner Inspection

CLEANING AND INSPECTION (Continued)

OIL PUMP

CLEANING

Wash all parts in a suitable solvent and inspect carefully for damage or wear.

INSPECTION

(1) Before installing oil pump check pump bore depth in block (A) and pump body height (B) (Fig. 78). Difference between A and B should be 0.020-0.082 mm.

J9509-8

DESCRIPTION AND OPERATION

EXHAUST SYSTEM

DESCRIPTION

The basic exhaust system consists of exhaust manifold(s), exhaust pipe with oxygen sensors, catalytic converter(s), heat shield(s), muffler and tailpipe (Fig. 1) (Fig. 2) (Fig. 3) (Fig. 4) (Fig. 5) (Fig. 6)

CATALYTIC CONVERTERS

DESCRIPTION

California emissions vehicles incorporate two mini catalytic converters into the exhaust system. These catalytic converters are made of stainless steel designed to operate at extremely high temperatures.

The stainless steel catalytic converter body is designed to last the life of the vehicle. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

Unleaded gasoline must be used to avoid contaminating the catalyst core.

Federal emission vehicles use only one catalytic converter. However, California emission vehicles incorporate two mini catalytic converters located after the exhaust manifolds and before the inline catalytic converter (Fig. 7).

MUFFLER

DESCRIPTION

Both the 2.5L and 4.0L engines use a galvanized steel muffler to control exhaust noise levels and exhaust back pressure.

80bcea58

Fig. 9 Tailpipe—Typical

1 – TAILPIPE

TAILPIPE

DESCRIPTION

The tail pipe is also made of galvanized steel

OPERATION

The tailpipe channels the exhaust out of the muffler and out from under the vehicle to control noise and prevent exhaust gas fumes from entering the passenger compartment.

DIAGNOSIS AND TESTING

EXHAUST SYSTEM

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	<ol style="list-style-type: none"> 1. Leaks at pipe joints. 2. Rusted or blown out muffler. 3. Broken or rusted out exhaust pipe. 4. Exhaust pipe leaking at manifold flange. 5. Exhaust manifold cracked or broken. 6. Leak between exhaust manifold and cylinder head. 7. Catalytic converter rusted or blown out. 8. Restriction in exhaust system. 	<ol style="list-style-type: none"> 1. Tighten clamps/bolts to specified torque at leaking joints. 2. Replace muffler. Inspect exhaust system. 3. Replace exhaust pipe. 4. Tighten/replace flange attaching nuts/bolts. 5. Replace exhaust manifold. 6. Tighten exhaust manifold to cylinder head bolts. 7. Replace catalytic converter assy. 8. Remove restriction, if possible. Replace restricted part if necessary.

When servicing and replacing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust to hang by the oxygen sensor wires will damage the harness and/or sensor.

REMOVAL AND INSTALLATION

EXHAUST PIPE—EARLY BUILD

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

CAUTION: When servicing exhaust system components, disconnect the oxygen sensor connector. Allowing the exhaust system to hang by the oxygen sensor harness will damage the wiring and/or sensor.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with Mopar® Rust Penetrant (Fig. 10) (Fig. 11). Allow 5 minutes for penetration.

Fig. 10 Exhaust Pipe Removal—2.5L Early Build

- 1 - NUT
- 2 - TRANSMISSION SUPPORT
- 3 - MINI CATALYTIC CONVERTER
- 4 - EXHAUST PIPE
- 5 - EXHAUST MANIFOLD

- (3) Disconnect the oxygen sensor connector(s).
- (4) Disconnect the exhaust pipe from the engine exhaust manifold. Discard the seal (4.0L engine, only).

(5) Support the transmission and remove the rear crossmember.

(6) Remove the clamp nuts and clamp. To remove the exhaust pipe from the catalytic converter, apply heat until the metal becomes cherry red. Disconnect

80be44ba

the exhaust pipe from the catalytic converter. Remove the exhaust pipe.

INSTALLATION

(1) Assemble exhaust pipe to manifold and catalytic converter loosely to permit proper alignment of all parts.

(2) Use a new clamp and tighten the nuts to 61 N·m (45 ft. lbs.) torque.

(3) Connect the exhaust pipe to the engine exhaust manifold (Fig. 10) (Fig. 11). Install a new seal between the exhaust manifold and the exhaust pipe (4.0L engine only). Tighten the nuts to 31 N·m (23 ft. lbs.) torque.

(4) Install the rear crossmember. Install and tighten the four (4) crossmember to rear mount nuts to 22 N·m (16 ft. lbs.) Install and tighten the crossmember to sill bolts to 42 N·m (31 ft. lbs.) torque. Remove the support from the transmission.

(5) Carefully coat the threads on the oxygen sensor(s) with anti-seize compound. Install the sensor and tighten the nut to 27 N·m (20 ft. lbs.) torque.

(6) Lower the vehicle.

(7) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

REMOVAL AND INSTALLATION (Continued)

EXHAUST PIPE—LATE BUILD

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

CAUTION: When servicing exhaust system components, disconnect the oxygen sensor connector. Allowing the exhaust system to hang by the oxygen sensor harness will damage the wiring and/or sensor.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts with Mopar® Rust Penetrant. Allow 5 minutes for penetration.
- (3) Disconnect the oxygen sensor connector(s).
- (4) Disconnect the exhaust pipe from the engine exhaust manifold (Fig. 12) (Fig. 13).
- (5) Disconnect the exhaust flange at the exhaust pipe to catalytic converter
- (6) Slide the exhaust pipe toward rear of vehicle to disengage exhaust hanger from transmission support. Remove exhaust pipe.

- 3 - EXHAUST FLANGE JOINT
- 4 - TRANSMISSION SUPPORT
- 5 - EXHAUST FLANGE JOINT
- 6 - EXHAUST PIPE
- 7 - MINI CATALYTIC CONVERTER

INSTALLATION

- (1) Position exhaust pipe into vehicle.
- (2) Position exhaust hanger into transmission support.
- (3) Position exhaust pipe onto exhaust manifold (Fig. 12) (Fig. 13). Install mounting nuts and bolts. **DO NOT** tighten nuts and bolts at this time.
- (4) Position catalytic converter flange onto exhaust pipe flange. Install three nuts and tighten to 28.5 N·m (21 ft. lbs.).
- (5) Tighten exhaust pipe to exhaust manifold mounting bolts and nuts to 31 N·m (23 ft. lbs.).
- (6) Connect the oxygen sensor connector(s).
- (7) Lower vehicle.
- (8) Start engine check for leaks.

CATALYTIC CONVERTER—EARLY BUILD

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

REMOVAL AND INSTALLATION (Continued)

CAUTION: When servicing exhaust system components, disconnect the oxygen sensor connector. Allowing the exhaust system to hang by the oxygen sensor harness will damage the wiring and/or sensor.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the clamps from the catalytic converter and muffler connection (Fig. 14).
- (3) Disconnect and remove the oxygen sensor from the catalytic converter.
- (4) Heat the catalytic converter and muffler connection with an oxyacetylene torch until the metal becomes cherry red.
- (5) While the metal is still cherry red, twist the muffler assembly back and forth to separate it from the catalytic converter.
- (6) Disconnect the exhaust pipe from the catalytic converter (Fig. 14). If needed, heat up the pipes to separate.

Fig. 14 Catalytic Converter to Muffler and Exhaust Pipe Connection—Early Build

- 1 - EXHAUST CLAMP ASSEMBLY
- 2 - OXYGEN SENSOR
- 3 - MUFFLER
- 4 - CATALYTIC CONVERTER
- 5 - EXHAUST PIPE

INSTALLATION

- (1) Connect the catalytic converter to the exhaust pipe and the muffler/tailpipe assy. (Fig. 14). Use a new clamp and tighten the nuts to 61 N·m (45 ft. lbs.) torque.
- (2) Install the muffler onto the catalytic converter until the alignment tab is inserted into the alignment slot.
- (3) Install a new clamp at the muffler and catalytic converter connection (Fig. 14). Tighten the clamp nut to 61 N·m (45 ft. lbs.) torque.
- (4) Coat the oxygen sensor with anti-seize compound. Install the sensor and tighten the nut to 27 N·m (20 ft. lbs.) torque.
- (5) Lower the vehicle.
- (6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

CATALYTIC CONVERTER—LATE BUILD

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

CAUTION: When servicing exhaust system components, disconnect the oxygen sensor connector. Allowing the exhaust system to hang by the oxygen sensor harness will damage the wiring and/or sensor.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Disconnect and remove the oxygen sensor from the catalytic converter.
- (3) Saturate the bolts and nuts with Mopar® Rust Penetrant. Allow 5 minutes for penetration.
- (4) Remove the nuts and bolts then disconnect the catalytic converter flange from the muffler flange.
- (5) Remove the nuts from the catalytic converter to exhaust pipe flange and remove catalytic converter and gasket from vehicle (Fig. 15).

INSTALLATION

- (1) Position a new gasket then position catalytic converter onto exhaust pipe (Fig. 15), install three mounting nuts. **DO NOT** tighten nuts at this time.
- (2) Position muffler flange onto catalytic converter flange and install nuts and bolts. Tighten Nuts to 28.5 N·m (21 ft. lbs.).

REMOVAL AND INSTALLATION (Continued)

2000 XJ Service Manual
 Publication No. 81-370-0046
 TSB 26-03-00 March, 2000

Fig. 15 Catalytic Converter—Late Build

- 1 - NUT
- 2 - CATALYTIC CONVERTER TO MUFFLER FLANGE JOINT
- 3 - CATALYTIC CONVERTER
- 4 - GASKET
- 5 - EXHAUST PIPE FLANGE JOINT

(3) Tighten catalytic converter to exhaust pipe flange mounting nuts to 28.5 N·m (21 ft. lbs.).

(4) Install oxygen sensor into catalytic converter. Connect oxygen sensor.

(5) Lower vehicle.

(6) Start engine check for leaks.

MUFFLER AND TAILPIPE—EARLY BUILD

All original equipment exhaust systems are manufactured with the exhaust tailpipe welded to the muffler. Service replacement mufflers and exhaust tailpipes are either clamped together or welded together.

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINE.

CAUTION: When servicing exhaust system components, disconnect the oxygen sensor connector. Allowing the exhaust system to hang by the oxygen sensor harness will damage the wiring and/or sensor.

REMOVAL

(1) Raise and support the vehicle.

(2) Disconnect front tailpipe hanger from the insulator (Fig. 16).

(3) Remove the front exhaust clamp from the catalytic converter and muffler connection (Fig. 17).

Fig. 16 Front Exhaust Tailpipe Hanger

- 1 - MUFFLER
- 2 - INSULATOR
- 3 - TAILPIPE
- 4 - FRONT TAILPIPE HANGER

(4) Heat the catalytic converter-to-muffler connection with an oxyacetylene torch until the metal becomes cherry red.

(5) While the metal is still cherry red, remove the exhaust muffler/tailpipe assembly from the catalytic converter.

(6) Slide the muffler/tailpipe assy. rearward and out of the rear exhaust tailpipe mounting bracket (Fig. 17).

(7) Remove the muffler from the exhaust tailpipe:

- To remove an original equipment exhaust muffler/tailpipe combination, cut the exhaust tailpipe close to the muffler. Collapse the part remaining in the muffler and remove.

- To remove a service exhaust tailpipe/muffler combination, apply heat until the metal becomes cherry red. Remove the exhaust tailpipe/muffler clamp and twist the exhaust tailpipe out of the muffler.

REMOVAL AND INSTALLATION (Continued)

- 2 - MUFFLER AND TAIL PIPE HANGER
- 3 - CLAMP

- 4 - CATALYTIC CONVERTER
- 5 - MUFFLER AND TAIL PIPE ASSEMBLY
- 6 - TAIL PIPE

INSTALLATION

(1) Install the muffler onto the catalytic converter. Install the clamp and tighten the nut finger tight.

(2) Install the exhaust tailpipe into the rear of the muffler.

(3) Install the exhaust tailpipe/muffler assembly on the rear exhaust tailpipe mounting bracket. Make sure that the exhaust tailpipe has sufficient clearance from the floor pan.

(4) Install front tailpipe hanger into the insulator (Fig. 16).

(5) Align the muffler and tighten the nuts on the muffler-to-catalytic converter clamp to 61 N·m (45 ft. lbs.) torque (Fig. 17).

(6) Align the tailpipe and install a new clamp at the muffler to tailpipe connection.

(7) Tighten the muffler to tailpipe clamp to 61 N·m (45 ft. lbs.)

(8) Lower the vehicle.

(9) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

MUFFLER AND TAILPIPE—LATE BUILD

All original equipment exhaust systems are manufactured with the exhaust tailpipe welded to the muffler. Service replacement mufflers and exhaust tailpipes are either clamped together or welded together.

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINE.

CAUTION: When servicing exhaust system components, disconnect the oxygen sensor connector. Allowing the exhaust system to hang by the oxygen sensor harness will damage the wiring and/or sensor.

REMOVAL AND INSTALLATION (Continued)

REMOVAL

- (1) Raise and support the vehicle.
- (2) Disconnect front tailpipe hanger from the insulator (Fig. 18).
- (3) Remove the mounting nuts from the muffler to catalytic converter flange (Fig. 18).
- (4) Remove the clamp retaining the tailpipe to the rear tailpipe hanger (Fig. 18).
- (5) Remove the muffler and tailpipe assembly from the vehicle.

INSTALLATION

- (1) Position muffler and tailpipe assembly into vehicle.
- (2) Install clamp retaining tailpipe to the rear tailpipe hanger (Fig. 18). **DO NOT** tighten clamp at this time.
- (3) Install mounting nuts onto the muffler to catalytic converter flange studs (Fig. 18). **DO NOT** tighten nuts at this time.

80c4f500

- 7 - NUT

REMOVAL AND INSTALLATION (Continued)

(4) Make sure the exhaust system is in proper alignment. There should be at least 25mm (1 inch) clearance between the exhaust components and any surrounding components.

(5) Tighten muffler to catalytic converter flange mounting nuts to 28.5 N·m (21 ft. lbs.).

(6) Tighten tailpipe clamp to 48 N·m (35 ft. lbs.).

HEAT SHIELDS

REMOVAL

(1) Raise and support the vehicle.

(2) Remove the screws and/or nuts holding the heat shields to the frame and/or floor pan (Fig. 19).

Fig. 19 Heat Shield Removal/Installation

- 1 - BOLTS
- 2 - MUFFLER HEAT SHIELD
- 3 - NUTS
- 4 - FLOOR PAN

(3) When removing muffler heat shield, the muffler front support bracket must be removed first.

(4) Slide the shields out around the exhaust system.

INSTALLATION

(1) Position the heat shields to the floor pan or the frame and install the screws and/or nuts.

(2) Tighten the nuts and/or screws to 45 N·m (33 ft. lbs.) (Fig. 19).

(3) Lower the vehicle.

DESCRIPTION AND OPERATION

EXHAUST SYSTEM

The basic exhaust system consists of an engine exhaust manifold, turbocharger,exhaust down pipe, exhaust pipe, exhaust heat shield(s), muffler and exhaust tailpipe

The exhaust system uses a single muffler.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. If the system contacts any body panel, it will transfer objectionable noises originating from the engine to the body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or equivalent). This will assure proper alignment and provide acceptable exhaust noise levels.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

EXHAUST HEAT SHIELDS

Exhaust heat shields are needed to protect both the vehicle and the environment from the high temperatures (Fig. 1).

DO NOT allow the engine to operate at fast idle for extended periods (over 5 minutes). This condition

may result in excessive temperatures in the exhaust system and on the floor pan.

Fig. 1 Heat Shields

- 1 – EXHAUST MANIFOLD HEAT SHIELD
- 2 – DOWN PIPE HEAT SHIELD

REMOVAL AND INSTALLATION

EXHAUST PIPE

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Saturate the bolts and nuts at turbo down pipe to exhaust pipe with heat valve lubricant. Allow 5 minutes for penetration..
- (3) Disconnect bolts from exhaust pipe to turbo down pipe (Fig. 2).

REMOVAL AND INSTALLATION (Continued)

80b9a496

Fig. 2 Exhaust Down Pipe to Exhaust Pipe

- 1 - EXHAUST INLET PIPE RETAINING BOLTS
2 - EXHAUST SYSTEM SUPPORT CLAMP

(4) Remove the clamp nuts at muffler (Fig. 3). To remove the exhaust pipe from the muffler, apply heat until the metal becomes cherry red. Disconnect the exhaust pipe from the muffler. Remove the exhaust pipe.

80a243e8

Fig. 3 Front Pipe to Muffler

- 1 - BRACKET
2 - FRONT PIPE
3 - RUBBER ISOLATOR
4 - MUFFLER

INSTALLATION

- (1) Assemble exhaust pipe to muffler, loosely to permit proper alignment of all parts.
- (2) Connect the exhaust pipe to the turbo down pipe manifold. Tighten the bolts to 22.5 N·m torque.

(3) Use a new clamp and tighten the nuts to 43 N·m torque.

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

MUFFLER AND EXHAUST TAILPIPE

All original equipment exhaust systems are manufactured with the exhaust tailpipe welded to the muffler. Service replacement mufflers and exhaust tailpipes are either clamped together or welded together.

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

REMOVAL

- (1) Raise and support the vehicle.
- (2) Remove the front muffler clamp from the exhaust pipe and muffler connection.
- (3) Remove the rear exhaust tailpipe hanger clamp and remove the exhaust tailpipe from the front exhaust tailpipe hanger.
- (4) Remove the exhaust tailpipe assembly from the muffler.

INSTALLATION

- (1) Install the muffler onto the exhaust pipe. Install the clamp and tighten the nuts finger tight.
- (2) Install the exhaust tailpipe into the rear of the muffler.
- (3) Install the exhaust tailpipe/muffler assembly on the rear exhaust tailpipe hanger. Make sure that the exhaust tailpipe has sufficient clearance from the floor pan.
- (4) Install the remaining clamps and the front exhaust tailpipe hanger.
- (5) Tighten the nuts on the muffler-to-exhaust pipe clamp to 43 N·m torque.
- (6) Lower the vehicle.
- (7) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

EXHAUST MANIFOLD AND TURBOCHARGER (LHD)**REMOVAL**

- (1) Disconnect the negative battery cable
- (2) Disconnect the breather hose from air cleaner outlet hose (Fig. 4).

REMOVAL AND INSTALLATION (Continued)

- 5 - AIR FILTER OUTLET (FRESH AIR) HOSE
- 6 - INNERCOOLER INLET HOSE
- 7 - HEATER CORE COOLANT SUPPLY HOSES

(3) Remove the air filter cover and hose from turbocharger, remove the assembly (Fig. 4).

(4) Remove the EGR vacuum supply hose from the EGR valve.

(5) Remove the innercooler inlet and outlet hoses from the engine (Fig. 4).

(6) Remove the (2) bolts holding the EGR tube to the EGR valve.

(7) Remove the intake manifold elbow and EGR valve as an assembly.

(8) Raise the vehicle on a hoist.

(9) Drain the cooling system. Refer to Group 7, Cooling System for procedure.

(10) Remove the exhaust system support clamp (Fig. 5).

(11) Disconnect the exhaust system at the (3) bolt flange (Fig. 5).

CAUTION: Heatshield is very sharp. Wear gloves to prevent injury.

(12) Unstrap the exhaust downpipe heatshield (Fig. 6).

(13) Disconnect the turbocharger oil return hose from the engine block (Fig. 7).

(14) Lower the vehicle from the hoist.

(15) Remove the EGR tube from exhaust manifold.

80b9a496

- 2 - RIGHT ENGINE MOUNT THROUGHBOLT NUT
- 3 - TURBOCHARGER OIL RETURN HOSE
- 4 - EXHAUST MANIFOLD DOWNPIPE
- 5 - TURBOCHARGER

CAUTION: Heatshield is very sharp. Wear gloves to prevent injury.

(19) Remove the exhaust downpipe heatshield by pulling straight up.

(20) Remove the (5) bolts attaching the exhaust downpipe to the turbocharger and remove pipe.

(21) Remove the (8) exhaust manifold retaining bolts, it is necessary to access the bolt behind the manifold outlet from the underneath of the vehicle.

(22) Remove the exhaust manifold and turbocharger assembly from the vehicle

(23) Place assembly in a vice to remove the (3) exhaust manifold to turbocharger retaining nuts (Fig. 8).

Cleaning

Always use new gaskets during assembly. All gasket mating surfaces must be cleaned of old gasket material to produce a smooth and dirt free sealing surface for the new gasket.

INSTALLATION

(1) Transfer the oil return line to the new turbocharger (Fig. 8).

(2) Install the turbo on the exhaust manifold (Fig. 8). Torque the nuts to 32 N·m (23 ft. lbs.).

80b8992d

(3) Install the exhaust manifold and turbocharger assembly in the vehicle

(4) Install the (8) exhaust manifold retaining nuts. Torque nuts to 32 N·m (23 ft. lbs.).

(5) Install the exhaust manifold downpipe. Torque bolts to 32 N·m (23 ft. lbs.).

CAUTION: Heatshield is very sharp. Wear gloves to prevent injury.

(6) Slide the exhaust downpipe heatshield down over pipe. Do not attempt to strap heatshield in position at this time, wait until vehicle is raised on hoist.

(7) Install the oil supply line on turbocharger. Torque bango bolt fitting to 27 N·m (20 ft. lbs.).

(8) Connect the heater hoses.

(9) Position and install the exhaust manifold heatshield. Torque bolts to 11 N·m (97 in. lbs.).

(10) Raise the vehicle on a hoist.

(11) Connect the turbocharger oil return line to the engine block (Fig. 9).

(12) Strap the exhaust downpipe heatshield in its original position.

(13) Install the exhaust system support clamp (Fig. 10). Torque nuts to 23 N·m (17 ft. lbs.).

REMOVAL AND INSTALLATION (Continued)

- 7 - HEATER CORE COOLANT SUPPLY HOSES

(19) Install the EGR vacuum supply hose on the EGR valve.

(20) Install the air filter cover and outlet hose on turbocharger (Fig. 11).

(21) Connect the breather hose on the air cleaner outlet hose (Fig. 11).

(22) Fill the cooling system. Refer to Group 7, Cooling System for procedure.

(23) Connect the negative battery cable

(24) Start the engine and check for leaks.

EXHAUST MANIFOLD AND TURBOCHARGER (RHD)

REMOVAL

(1) Disconnect the negative battery cable

(2) Disconnect the breather hose from the air cleaner outlet hose.

REMOVAL AND INSTALLATION (Continued)

(3) Remove the air filter cover and the hose from the turbocharger, remove the assembly.

(4) Raise the vehicle on a hoist.

(5) Drain the cooling system. Refer to Group 7, Cooling System for the procedure.

(6) Remove the exhaust system support clamp (Fig. 12).

80b9a496

Fig. 12 Exhaust System Inlet Pipe Connection

(20) Remove the clutch master cylinder heatshield (Fig. 15).

(21) Remove the turbocharger oil supply line from the engine block (Fig. 16).

(22) Working inside of the vehicle, remove the Knee Blocker. Refer to Group 8E, Instrument Panel Systems for the procedure.

(23) Disconnect the neutral safety switch electrical connector at the clutch pedal.

(24) Remove the (2) clutch master cylinder retaining nuts from the bulkhead.

(25) Working from the inside of the engine compartment, remove the clutch master cylinder from the bulkhead and position the cylinder and line assembly out of the way.

(26) Remove the (5) bolts attaching the exhaust downpipe to the turbocharger and remove the pipe.

(27) Remove the (8) exhaust manifold retaining bolts, it is necessary to access the bolt behind the manifold outlet from the underneath of the vehicle.

80b89932

(28) Remove the steering shaft pinchbolt and slide the shaft straight off of the gearbox input shaft. Position aside.

(29) Remove the exhaust manifold and the turbocharger assembly from the vehicle

(30) Place the turbo assembly in a vice to remove the (3) exhaust manifold to turbocharger retaining nuts (Fig. 17).

Cleaning

Always use new gaskets during assembly. All gasket mating surfaces must be cleaned of all old gasket material to produce a smooth and dirt free sealing surface for the new gasket.

INSTALLATION

(1) Install the turbocharger on the exhaust manifold (Fig. 17). Torque nuts to 32 N·m (23 ft. lbs.).

(2) Install the exhaust manifold and turbocharger assembly in the vehicle

(3) Install the (8) exhaust manifold retaining nuts, it is necessary to access the bolt behind the manifold outlet from underneath the vehicle. Torque nuts to 32 N·m (23 ft. lbs.).

(4) Install the exhaust manifold downpipe. Torque the bolts to 32 N·m (23 ft. lbs.).

(16) Working from the inside of the vehicle, Install the (2) clutch master cylinder retaining nuts.

(17) Connect the neutral safety switch at the clutch pedal.

(18) Install the Knee Blocker. Refer to Group 8E, Instrument Panel Systems for procedure.

(19) Install the clutch master cylinder heatshield.

(20) Install the intake manifold elbow and the EGR valve as an assembly. Torque the intake elbow bolts to 11 N·m (97 in.lbs.).

(21) Install the (2) bolts holding the EGR tube to the EGR valve. Torque to bolts 27 N·m (20 ft. lbs.).

(22) Torque the EGR tube on the exhaust manifold to 28 N·m (21 ft. lbs.).

(23) Install the innercooler inlet and outlet hoses on the engine.

(24) Install the EGR vacuum supply hose on the EGR valve.

(25) Install the air filter cover and outlet hose on the turbocharger.

(26) Connect the breather hose on the air cleaner outlet hose.

(27) Install the heater core coolant supply and the brake vacuum supply lines in their original position.

(28) Connect the negative battery cable

(29) Fill the cooling system. Refer to Group 7, Cooling System for the procedure.

(30) Start the engine and check for leaks.

REMOVAL AND INSTALLATION (Continued)

INTAKE MANIFOLD

REMOVAL

- (1) Remove exhaust manifold and turbocharger assembly.
- (2) Remove water manifold.
- (3) Remove intake manifold.

CLEANING

Clean the intake manifold and cylinder head mating surfaces. **DO NOT allow foreign material to enter either the intake manifold or the ports in the cylinder head.**

INSTALLATION

- (1) Install the new intake manifold gasket.
- (2) Position the intake manifold in place and finger tighten the mounting nuts.
- (3) Tighten the fasteners in sequence and to the specified torque 30 N·m.
- (4) Position the water manifold in place and finger tighten the mounting nuts.
- (5) Tighten the fasteners to the specified torque 12 N·m.
- (6) Install exhaust manifold and turbocharger assembly.
- (7) Install charge air cooler hose to intake manifold.
- (8) Connect the battery negative cable.
- (9) Start engine and check for leaks.

DESCRIPTION AND OPERATION

FRAME AND BUMPERS

FRAME

DESCRIPTION

Jeep Cherokee vehicles do not have a conventional frame. They are constructed as a unitized body and frame. Jeep unibodies are constructed from special high strength steel and coated metals. This process reduces weight and provides strength to withstand the forces applied against structural members. The structural members provide a unibody that has great structural strength.

BUMPERS

DESCRIPTION

The bumpers on the Jeep Cherokee are made up of the main bumper beam, the end caps, air deflector (front bumper) and mounting brackets. Some Cherokee models also have a tow hook support bracket.

OPERATION

The bumpers are fastened to the unitized body frame rails. The bumper end caps are fastened to the bumper and the body side sheet metal.

REMOVAL AND INSTALLATION		REAR BUMPER END CAP	4
FRONT BUMPER END CAP	2	REAR BUMPER	4
FRONT BUMPER	3	REAR TOW HOOK	5
FRONT TOW HOOK	3		

REMOVAL AND INSTALLATION

FRONT BUMPER END CAP

REMOVAL

- (1) Remove the rivet attaching the end cap to the air deflector.
- (2) Remove the bolts and nuts attaching the end cap to the bumper (Fig. 1).
- (3) Pull back the wheelhouse liner and remove the screws attaching the end cap to the front fender.

- (4) Lifting the end cap from the bottom, tilt slightly upward and slide it outward to disengage the retainer tab from the bumper (Fig. 2).

- (5) Separate the end cap from the bumper.

INSTALLATION

- (1) Position the end cap on the bumper and engage the retaining tab.
- (2) Install the screws attaching the end cap to the front fender.
- (3) Install the bolts attaching the end cap to the bumper. Tighten the nut to 9 N·m (7 ft. lbs.) torque.

(4) Install the rivet attaching the end cap to air deflector.

FRONT BUMPER

REMOVAL

- (1) Remove bumper end caps.
- (2) If equipped, disengage fog lamp wire harness connectors.
- (3) Disconnect vacuum line from reservoir (Fig. 3).
- (4) Remove Torx-head bolts that attach bumper to mounting brackets (Fig. 1).
- (5) Remove bumper from vehicle.
- (6) If necessary, remove bolts attaching bumper mounting brackets to frame.

INSTALLATION

- (1) If removed, install bolts attaching bumper mounting brackets to frame. Tighten bolts to 55 N·m (41 ft. lbs.) torque.
- (2) Position bumper on front of vehicle.
- (3) Install Torx-head bolts that attach bumper to mounting brackets. Tighten bolts to 55 N·m (41 ft. lbs.) torque.
- (4) Connect vacuum line to reservoir.
- (5) If equipped, engage fog lamp wire harness connectors.
- (6) Install bumper end caps.

FRONT TOW HOOK

REMOVAL

- (1) Remove bolts attaching tow hook to tow hook reinforcement (Fig. 4).
- (2) Separate tow hook from reinforcement.

Fig. 3 Vacuum Reservoir

- 1 - VACUUM LINE
- 2 - RESERVOIR SCREWS
- 3 - VACUUM RESERVOIR

(3) If necessary, remove bolt attaching tow hook reinforcement to frame.

Fig. 4 Front Tow Hook

- 1 - MOUNTING BRACKET
- 2 - TOW HOOK
- 3 - TOW HOOK REINFORCEMENT

INSTALLATION

- (1) If removed, install bolt attaching tow hook reinforcement to frame. Tighten bolt to 30 N·m (22 ft. lbs.) torque.
- (2) Position tow hook on reinforcement.
- (3) Install bolts attaching tow hook to tow hook reinforcement. Tighten bolts to 100 N·m (74 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

REAR BUMPER END CAP

REMOVAL

- (1) Remove the screws attaching the bumper end cap to the quarter panel and the bumper (Fig. 5).
- (2) Lift the end cap slightly upward and slide it rearward to release it from the retainer.
- (3) Separate the end cap from the vehicle.

INSTALLATION

- (1) Position the end cap on the rear of the retainer and the outer edge of the bumper.
- (2) Slide the end cap forward onto the retainer. Ensure the end cap overlaps the lip of the rear wheelhouse liner.
- (3) Install the screw attaching the front of the end cap to the underside of the quarter panel and bumper.

REAR BUMPER

REMOVAL

- (1) For vehicles equipped with a trailer hitch, remove hitch before removing bumper. If necessary,

refer to removal procedure within Group 13, Frame and Bumpers.

- (2) Remove bumper end caps.
- (3) Remove upper nuts that attach bumper to bumper support brackets (Fig. 5).
- (4) Remove lower bolts that attach bumper to bumper support brackets.
- (5) Remove bumper from vehicle.
- (6) If necessary, remove bumper support brackets from the rear sill.

INSTALLATION

- (1) If removed, install bumper support brackets on the rear sill. Tighten bolts to 55 N·m (41 ft. lbs.) torque.
- (2) Position bumper on support brackets.
- (3) Install bolts that attach bumper to bumper support brackets. Tighten nuts to 55 N·m (41 ft. lbs.) torque.
- (4) Install bumper end caps.
- (5) If removed, install trailer hitch.

4 - BLIND RIVET

INSTALLATION

- (1) Position and support skid plate under fuel tank.
- (2) Install bolts to attach skid plate to underbody rails. Tighten bolts to 74 N·m (55 ft. lbs.) torque.
- (3) Remove support from under skid plate.

TRAILER HITCH

REMOVAL

- (1) If necessary, remove the trailer tow wire harness connector from the hitch (Fig. 4).
- (2) Support the hitch.
- (3) Remove the bolts that attach the trailer hitch to the frame sills and reinforcement brackets (Fig. 5).
- (4) If equipped, remove the fuel tank skid plate.

NOTE: The reinforcement brackets are held on the frame sills with two blind rivets.

INSTALLATION

- (1) Install frame reinforcement brackets, if removed. Slide the brackets through the vehicle rear sill openings and attach to the frame sills with blind rivets.
- (2) Using an adequate lifting device, position hitch at the proper location for installation on vehicle and support it.
- (3) If equipped, position fuel tank skid plate on vehicle frame sills.

DESCRIPTION AND OPERATION	
EMERGENCY TOW EYES	1

DESCRIPTION AND OPERATION

EMERGENCY TOW EYES

DESCRIPTION

Fig. 1 Front and Rear Emergency Tow Eyes

- 1 - FRONT TOW EYE
- 2 - SHIPPING USE ONLY
- 3 - REAR TOW EYE

Some vehicles are equipped with emergency tow eyes, one can be found in the front and rear of the vehicle (Fig. 1). The tow eyes are attached to the frame rails and intended for short distance emergency towing only.

OPERATION

The front tow eye has two holes, the front hole is for short towing use only and the rear angled hole is for shipping use only.
The rear tow eye has one hole and is intended for short towing use only.

CAUTION: Do not use the angled hole for towing. You could damage your vehicle.

CAUTION: Tow eyes are for emergency use only, to rescue a vehicle stranded off road. Do not use tow eyes for tow truck hookup or highway towing. You could damage your vehicle.

WARNING: Stand clear of vehicles when pulling with tow eyes. Tow straps and chains may break, causing serious injury.

DESCRIPTION AND OPERATION

PCM VIN REPROGRAMMING

OPERATION

USE THE DRB SCAN TOOL TO REPROGRAM THE NEW POWERTRAIN CONTROL MODULE (PCM) WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS

NOT DONE, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.

FUEL DELIVERY SYSTEM

DESCRIPTION

The fuel delivery system consists of:

- the fuel pump module containing the electric fuel pump, fuel filter/fuel pressure regulator, fuel gauge sending unit (fuel level sensor) and a separate fuel filter located at bottom of pump module

DESCRIPTION AND OPERATION (Continued)

- fuel tubes/lines/hoses
- quick-connect fittings
- fuel injector rail
- fuel injectors
- fuel tank
- fuel tank filler/vent tube assembly
- fuel tank filler tube cap
- accelerator pedal
- throttle cable

OPERATION

Fuel is returned through the fuel pump module and back into the fuel tank through the fuel filter/fuel pressure regulator. A separate fuel return line from the engine to the tank is not used.

The fuel tank assembly consists of: the fuel tank, fuel pump module assembly, fuel pump module lock-nut/gasket, and rollover valve (refer to Group 25, Emission Control System for rollover valve information).

A fuel filler/vent tube assembly using a pressure/vacuum, 1/4 turn fuel filler cap is used. The fuel filler tube contains a flap door located below the fuel fill cap.

Also to be considered part of the fuel system is the evaporation control system. This is designed to reduce the emission of fuel vapors into the atmosphere. The description and function of the Evaporative Control System is found in Group 25, Emission Control Systems.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module is installed in the top of the fuel tank (Fig. 1) or (Fig. 2). The fuel pump module contains the following components:

- A combination fuel filter/fuel pressure regulator
- A separate fuel pick-up filter (strainer)
- An electric fuel pump
- A threaded locknut to retain module to tank
- A gasket between tank flange and module
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply tube (line) connection

The fuel gauge sending unit, pick-up filter and fuel filter/fuel pressure regulator may be serviced separately. If the electrical fuel pump requires service, the entire fuel pump module must be replaced.

OPERATION

Refer to Fuel Pump, Fuel Filter/Fuel Pressure Regulator and Fuel Gauge Sending Unit.

DESCRIPTION AND OPERATION (Continued)

FUEL PUMP

DESCRIPTION

The fuel pump is located inside of the fuel pump module. A 12 volt, permanent magnet, electric motor powers the fuel pump.

OPERATION

Voltage to operate the electric pump is supplied through the fuel pump relay.

Fuel is drawn in through a filter at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

Check Valve Operation: The pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** Refer to the Fuel Pressure Leak Down Test for more information.

FUEL GAUGE SENDING UNIT

DESCRIPTION

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor track (card).

OPERATION

The fuel pump module has 4 different circuits (wires). Two of these circuits are used for the fuel gauge sending unit for fuel gauge operation, and for certain OBD II emission requirements. The other 2 wires are used for electric fuel pump operation.

For Fuel Gauge Operation: A constant input voltage source of about 12 volts (battery voltage) is supplied to the resistor track on the fuel gauge sending unit. This is fed directly from the Powertrain Control Module (PCM). **NOTE: For diagnostic purposes, this 12V power source can only be verified with the circuit opened (fuel pump module electrical connector unplugged). With the connectors plugged, output voltages will vary from about 6 volts at FULL, to about 8.6 volts at EMPTY (about 8.6 volts at EMPTY for Jeep models, and about 7.0 volts at EMPTY for Dodge Truck models).** The resistor track is used to vary the voltage (resistance) depending on fuel tank float level. As fuel level increases, the float and arm

move up, which decreases voltage. As fuel level decreases, the float and arm move down, which increases voltage. The varied voltage signal is returned back to the PCM through the sensor return circuit.

Both of the electrical circuits between the fuel gauge sending unit and the PCM are hard-wired (not multi-plexed). After the voltage signal is sent from the resistor track, and back to the PCM, the PCM will interpret the resistance (voltage) data and send a message across the multi-plex bus circuits to the instrument panel cluster. Here it is translated into the appropriate fuel gauge level reading. Refer to Instrument Panel for additional information.

For OBD II Emission Monitor Requirements: The PCM will monitor the voltage output sent from the resistor track on the sending unit to indicate fuel level. The purpose of this feature is to prevent the OBD II system from recording/setting false misfire and fuel system monitor diagnostic trouble codes. The feature is activated if the fuel level in the tank is less than approximately 15 percent of its rated capacity. If equipped with a Leak Detection Pump (EVAP system monitor), this feature will also be activated if the fuel level in the tank is more than approximately 85 percent of its rated capacity.

FUEL FILTER/FUEL PRESSURE REGULATOR

DESCRIPTION

The combination fuel filter and fuel pressure regulator is located on the top of fuel pump module (Fig. 1).

OPERATION

A combination fuel filter and fuel pressure regulator is used on all engines. A separate frame mounted fuel filter is not used with any engine.

Fuel Pressure Regulator Operation: The pressure regulator is a mechanical device that is not controlled by engine vacuum or the Powertrain Control Module (PCM).

The regulator is calibrated to maintain fuel system operating pressure of approximately 339 kPa \pm 34 kPa (49.2 psi \pm 5 psi) at the fuel injectors. It contains a diaphragm, calibrated springs and a fuel return valve. The internal fuel filter is also part of the assembly.

Fuel is supplied to the filter/regulator by the electric fuel pump through an opening tube at the bottom of filter/regulator (Fig. 3).

The regulator acts as a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine. A second check valve is located at the outlet end of the electric fuel pump. **Refer to Fuel Pump—Description and**

DESCRIPTION AND OPERATION (Continued)

**Fig. 3 Fuel Filter/Fuel Pressure Regulator**

- 1 - FUEL FILTER/FUEL PRESSURE REGULATOR
- 2 - TO FUEL INJECTORS
- 3 - FUEL SUPPLY TUBE
- 4 - O-RINGS
- 5 - FUEL INLET FROM PUMP
- 6 - FUEL RETURN TO TANK

Operation for more information. Also refer to the Fuel Pressure Leak Down Test and the Fuel Pump Pressure Tests.

If fuel pressure at the pressure regulator exceeds approximately 49 psi, an internal diaphragm closes and excess fuel is routed back into the tank through the pressure regulator. A separate fuel return line is not used.

FUEL TANK

DESCRIPTION

The fuel tank is constructed of a plastic material. Its main functions are for fuel storage and for placement of the fuel pump module.

OPERATION

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

A rollover valve(s) is mounted into the top of the fuel tank (or pump module). Refer to Emission Control System for rollover valve information.

An evaporation control system is connected to the rollover valve(s) to reduce emissions of fuel vapors into the atmosphere. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn

into the intake manifold. Certain models are also equipped with a self-diagnosing system using a Leak Detection Pump (LDP). Refer to Emission Control System for additional information.

FUEL INJECTORS

DESCRIPTION

An individual fuel injector (Fig. 4) is used for each individual cylinder.

**Fig. 4 Fuel Injector—Typical**

- 1 - FUEL INJECTOR
- 2 - NOZZLE
- 3 - TOP (FUEL ENTRY)

OPERATION

The top (fuel entry) end of the injector (Fig. 4) is attached into an opening on the fuel rail.

The fuel injectors are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are energized individually in a sequential order by the powertrain control module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust

DESCRIPTION AND OPERATION (Continued)

injector pulse width based on various inputs it receives.

Battery voltage is supplied to the injectors through the ASD relay.

The PCM determines injector pulse width based on various inputs.

FUEL INJECTOR RAIL/FUEL DAMPER—2.5L ENGINE

DESCRIPTION

The fuel injector rail is used to mount the fuel injectors to the engine (Fig. 5). On the 2.5L 4-cylinder engine, a **fuel damper** is located at the front of the fuel rail (Fig. 5).

80b6f034

Fig. 5 Fuel Injector Rail/Fuel Damper—2.5L Engine

- 2 - FUEL INJECTOR
- 3 - NUMBERED TAG
- 4 - FUEL RAIL
- 5 - FUEL RAIL MOUNTING BOLTS/NUTS
- 6 - TEST PORT
- 7 - CABLE BRACKET

OPERATION

The fuel injector rail supplies the necessary fuel to each individual fuel injector.

The fuel damper is used only to help control fuel pressure pulsations. These pulsations are the result of the firing of the fuel injectors. It is **not used** as a fuel pressure regulator. The fuel pressure regulator is **not mounted** to the fuel rail on any engine. It is located on the fuel tank mounted fuel pump module. Refer to Fuel Filter/Fuel Pressure Regulator in this group for information.

The fuel rail is not repairable.

FUEL RAIL/FUEL DAMPER—4.0L ENGINE

DESCRIPTION

The fuel rail is mounted to the intake manifold (Fig. 6). It is used to mount the fuel injectors to the engine. On the 4.0L 6-cylinder engine, a **fuel damper** is located near the center of the fuel rail (Fig. 6).

80bfe150

- 7 - FUEL INJECTOR RAIL
- 8 - FUEL DAMPER
- 9 - PRESSURE TEST PORT CAP
- 10 - MOUNTING BOLTS (4)
- 11 - QUICK-CONNECT FITTING

OPERATION

The fuel injector rail supplies the necessary fuel to each individual fuel injector.

The fuel damper is used only to help control fuel pressure pulsations. These pulsations are the result of the firing of the fuel injectors. It is **not used** as a fuel pressure regulator. The fuel pressure regulator is **not mounted** to the fuel rail on any engine. It is located on the fuel tank mounted fuel pump module.

DESCRIPTION AND OPERATION (Continued)

Refer to Fuel Filter/Fuel Pressure Regulator in this group for information.

The fuel rail is not repairable.

FUEL TANK FILLER TUBE CAP

DESCRIPTION

The plastic fuel tank filler tube cap is threaded onto the end of the fuel fill tube. Certain models are equipped with a 1/4 turn cap.

OPERATION

The loss of any fuel or vapor out of fuel filler tube is prevented by the use of a pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

CAUTION: Remove fill cap before servicing any fuel system component to relieve tank pressure. If equipped with a California emissions package and a Leak Detection Pump (LDP), the cap must be tightened securely. If cap is left loose, a Diagnostic Trouble Code (DTC) may be set.

FUEL TUBES/LINES/HOSES AND CLAMPS

DESCRIPTION

Also refer to Quick-Connect Fittings.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps.

QUICK-CONNECT FITTINGS

DESCRIPTION

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal. Refer to Quick-Connect Fittings Removal/Installation for more information.

CAUTION: The interior components (o-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

DIAGNOSIS AND TESTING

FUEL PUMP PRESSURE TEST

Use this test in conjunction with the Fuel Pump Capacity Test, Fuel Pressure Leak Down Test and Fuel Pump Amperage Test found elsewhere in this group.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1–2 seconds) rise to specification.

All fuel systems are equipped with a fuel tank module mounted, combination fuel filter/fuel pressure regulator. The fuel pressure regulator is not controlled by engine vacuum.

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH THE ENGINE OFF. BEFORE DISCONNECTING FUEL LINE AT FUEL RAIL, THIS PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

(1) Remove protective cap at fuel rail test port. Connect the 0–414 kPa (0–60 psi) fuel pressure gauge

DIAGNOSIS AND TESTING (Continued)

(from gauge set 5069) to test port pressure fitting on fuel rail (Fig. 7). **The DRB III Scan Tool along with the PEP module, the 500 psi pressure transducer, and the transducer-to-test port adapter may also be used in place of the fuel pressure gauge.**

Fig. 7 Fuel Pressure Test Gauge (Typical Gauge Installation at Test Port)

- 1 - SERVICE (TEST) PORT
2 - FUEL PRESSURE TEST GAUGE
3 - FUEL RAIL

(2) Start and warm engine and note pressure gauge reading. Fuel pressure should be $339 \text{ kPa} \pm 34 \text{ kPa}$ ($49.2 \text{ psi} \pm 5 \text{ psi}$) at idle.

(3) If engine runs, but pressure is below 44.2 psi, check for a kinked fuel supply line somewhere between fuel rail and fuel pump module. If line is not kinked, but specifications for either the Fuel Pump Capacity, Fuel Pump Amperage or Fuel Pressure Leak Down Tests were not met, replace fuel pump module assembly. Refer to Fuel Pump Module Removal/Installation.

(4) If operating pressure is above 54.2 psi, electric fuel pump is OK, but fuel pressure regulator is defective. Replace fuel filter/fuel pressure regulator. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for more information.

(5) Install protective cap to fuel rail test port.

FUEL PUMP CAPACITY TEST

Before performing this test, verify fuel pump pressure. Refer to Fuel Pump Pressure Test. Use this test in conjunction with the Fuel Pressure Leak Down Test.

(1) Release fuel system pressure. Refer to Fuel Pressure Release Procedure.

(2) Disconnect fuel supply line at fuel rail. Refer to Quick-Connect Fittings. Some engines may require air cleaner housing removal before line disconnection.

(3) Obtain correct Fuel Line Pressure Test Adapter Tool Hose. Tool number 6539 is used for 5/16" fuel lines and tool number 6631 is used for 3/8" fuel lines.

(4) Connect correct Fuel Line Pressure Test Adapter Tool Hose into disconnected fuel supply line. Insert other end of Adaptor Tool Hose into a graduated container.

(5) Remove fuel fill cap.

(6) To activate fuel pump and pressurize system, obtain DRB scan tool and actuate ASD Fuel System Test.

(7) A good fuel pump will deliver at least 1/4 liter of fuel in 7 seconds. Do not operate fuel pump for longer than 7 seconds with fuel line disconnected as fuel pump module reservoir may run empty.

(a) If capacity is lower than specification, but fuel pump can be heard operating through fuel fill cap opening, check for a kinked/damaged fuel supply line somewhere between fuel rail and fuel pump module.

(b) If line is not kinked/damaged, and fuel pressure is OK, but capacity is low, replace fuel filter/fuel pressure regulator. The filter/regulator may be serviced separately on certain applications. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

(c) If both fuel pressure and capacity are low, replace fuel pump module assembly. Refer to Fuel Pump Module Removal/Installation.

FUEL PRESSURE LEAK DOWN TEST

Use this test in conjunction with the Fuel Pump Pressure Test and Fuel Pump Capacity Test.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1-2 seconds) rise to specification.

Abnormally long periods of cranking to restart a hot engine that has been shut down for a short period of time may be caused by:

- Fuel pressure bleeding past a fuel injector(s).
- Fuel pressure bleeding past the check valve in the fuel pump module.

(1) Disconnect the fuel inlet line at fuel rail. Refer to Fuel Tubes/Lines/Hoses and Clamps in this section of the group for procedures. On some engines, air

DIAGNOSIS AND TESTING (Continued)

cleaner housing removal may be necessary before fuel line disconnection.

(2) Obtain correct Fuel Line Pressure Test Adapter Tool Hose. Tool number 6539 is used for 5/16" fuel lines and tool number 6631 is used for 3/8" fuel lines.

(3) Connect correct Fuel Line Pressure Test Adapter Tool Hose between disconnected fuel line and fuel rail (Fig. 8).

Fig. 8 Connecting Adapter Tool—Typical

- 1 - VEHICLE FUEL LINE
- 2 - TEST PORT "T"
- 3 - SPECIAL TOOL 6923, 6631, 6541 OR 6539
- 4 - FUEL PRESSURE TEST GAUGE
- 5 - FUEL LINE CONNECTION AT RAIL
- 6 - FUEL RAIL

(4) Connect the 0-414 kPa (0-60 psi) fuel pressure test gauge (from Gauge Set 5069) to the test port on the appropriate Adaptor Tool. **The DRB III Scan Tool along with the PEP module, the 500 psi pressure transducer, and the transducer-to-test port adapter may also be used in place of the fuel pressure gauge.**

The fittings on both tools must be in good condition and free from any small leaks before performing the proceeding test.

(5) Start engine and bring to normal operating temperature.

(6) Observe test gauge. Normal operating pressure should be 339 kPa \pm 34 kPa (49.2 psi \pm 5 psi).

(7) Shut engine off.

(8) Pressure should not fall below **30 psi for five minutes.**

(9) If pressure falls below 30 psi, it must be determined if a fuel injector, the check valve within the fuel pump module, or a fuel tube/line is leaking.

(10) Again, start engine and bring to normal operating temperature.

(11) Shut engine off.

(12) **Testing for fuel injector or fuel rail leakage:** Clamp off the rubber hose portion of Adaptor Tool between the fuel rail and the test port "T" on Adapter Tool. If pressure now holds at or above 30 psi, a fuel injector or the fuel rail is leaking.

(13) **Testing for fuel pump check valve, filter/regulator check valve or fuel tube/line leakage:** Clamp off the rubber hose portion of Adaptor Tool between the vehicle fuel line and test port "T" on Adapter Tool. If pressure now holds at or above 30 psi, a leak may be found at a fuel tube/line. If no leaks are found at fuel tubes or lines, one of the check valves in either the electric fuel pump or filter/regulator may be leaking.

Note: A quick loss of pressure usually indicates a defective check valve in the filter/regulator. A slow loss of pressure usually indicates a defective check valve in the electric fuel pump.

The electric fuel pump is not serviced separately. Replace the fuel pump module assembly. The filter/regulator may be replaced separately on certain applications. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

FUEL PUMP AMPERAGE TEST

This amperage (current draw) test is to be done in conjunction with the Fuel Pump Pressure Test, Fuel Pump Capacity Test and Fuel Pressure Leak Down Test. Before performing the amperage test, be sure the temperature of the fuel tank is above 50° F (10° C).

The DRB Scan Tool along with the DRB Low Current Shunt (LCS) adapter (Fig. 9) and its test leads will be used to check fuel pump amperage specifications.

(1) Be sure fuel tank contains fuel before starting test. If tank is empty or near empty, amperage readings will be incorrect.

(2) Obtain LCS adapter.

(3) Plug cable from LCS adapter into DRB scan tool at SET 1 receptacle.

(4) Plug DRB into vehicle 16-way connector (data link connector).

(5) Connect (-) and (+) test cable leads into LCS adapter receptacles. Use **10 amp (10A +)** receptacle and common (-) receptacles.

(6) Gain access to MAIN MENU on DRB screen.

(7) Press DVOM button on DRB.

DIAGNOSIS AND TESTING (Continued)

Fig. 9 Low Current Shunt Adapter

- 1 - LOW CURRENT SHUNT ADAPTER
- 2 - PLUG TO DRB
- 3 - TEST LEAD RECEPTACLES

- (8) Using left/right arrow keys, highlight CHANNEL 1 function on DRB screen.
- (9) Press ENTER three times.
- (10) Using up/down arrow keys, highlight RANGE on DRB screen (screen will default to 2 amp scale).
- (11) Press ENTER to change 2 amp scale to 10 amp scale. **This step must be done to prevent damage to DRB scan tool or LCS adapter (blown fuse).**
- (12) Remove cover from Power Distribution Center (PDC).
- (13) Remove fuel pump relay from PDC. Refer to label on PDC cover for relay location.

WARNING: BEFORE PROCEEDING TO NEXT STEP, NOTE THE FUEL PUMP WILL BE ACTIVATED AND SYSTEM PRESSURE WILL BE PRESENT. THIS WILL OCCUR AFTER CONNECTING TEST LEADS FROM LCS ADAPTER INTO FUEL PUMP RELAY CAVITIES. THE FUEL PUMP WILL OPERATE EVEN WITH IGNITION KEY IN OFF POSITION. BEFORE ATTACHING TEST LEADS, BE SURE ALL FUEL LINES AND FUEL SYSTEM COMPONENTS ARE CONNECTED.

CAUTION: TO PREVENT POSSIBLE DAMAGE TO THE VEHICLE ELECTRICAL SYSTEM AND LCS ADAPTER, THE TEST LEADS MUST BE CONNECTED INTO RELAY CAVITIES EXACTLY AS SHOWN IN FOLLOWING STEPS.

- Depending upon vehicle model, year or engine configuration, three different types of relays may be used: Type-1, type-2 and type-3.
- (14) If equipped with **type-1 relay** (Fig. 10), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 10).
- (15) If equipped with **type-2 relay** (Fig. 11), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 11).
- (16) If equipped with **type-3 relay** (Fig. 12), attach test leads from LCS adapter into PDC relay cavities number 3 and 5. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 12).

Fig. 10 Type-1 Relay

- (17) When LCS adapter test leads are attached into relay cavities, fuel pump **will be activated**. Determine fuel pump amperage on DRB screen. Amperage should be below 10.0 amps. If amperage is below 10.0 amps, and specifications for the Fuel Pump Pressure, Fuel Pump Capacity and Fuel Pressure Leak Down tests were met, the fuel pump module is OK.
- (18) If amperage is more than 10.0 amps, replace fuel pump module assembly. The electric fuel pump is not serviced separately.
- (19) Disconnect test leads from relay cavities immediately after testing.

DIAGNOSIS AND TESTING (Continued)

Fig. 11 Type-2 Relay

Fig. 12 Type-3 Relay

FUEL GAUGE SENDING UNIT

The fuel gauge sending unit contains a variable resistor (track). As the float moves up or down, electrical resistance will change. Refer to Instrument Panel and Gauges for Fuel Gauge testing. To test the gauge sending unit only, it must be removed from vehicle. The unit is part of the fuel pump module. Refer to Fuel Pump Module Removal/Installation for procedures. Measure the resistance across the sending unit terminals. With float in up position, resistance should be 20 ohms (+/- 5%). With float in down position, resistance should be 270 ohms (+/- 5%).

FUEL INJECTOR TEST

To perform a complete test of the fuel injectors and their circuitry, use the DRB scan tool and refer to the appropriate Powertrain Diagnostics Procedures manual. To test the injector only, refer to the following:

Disconnect the fuel injector wire harness connector from the injector. The injector is equipped with 2

electrical terminals (pins). Place an ohmmeter across the terminals. Resistance reading should be approximately 12 ohms ± 1.2 ohms at 20°C (68°F).

SERVICE PROCEDURES

FUEL SYSTEM PRESSURE RELEASE PROCEDURE

Use following procedure if the fuel injector rail is, or is not equipped with a fuel pressure test port.

- (1) Remove fuel fill cap.
- (2) Remove fuel pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.
- (3) Start and run engine until it stalls.
- (4) Attempt restarting engine until it will no longer run.
- (5) Turn ignition key to OFF position.

CAUTION: Steps 1, 2, 3 and 4 must be performed to relieve high pressure fuel from within fuel rail. Do not attempt to use following steps to relieve this pressure as excessive fuel will be forced into a cylinder chamber.

- (6) Unplug connector from any fuel injector.
- (7) Attach one end of a jumper wire with alligator clips (18 gauge or smaller) to either injector terminal.
- (8) Connect other end of jumper wire to positive side of battery.
- (9) Connect one end of a second jumper wire to remaining injector terminal.

CAUTION: Powering an injector for more than a few seconds will permanently damage the injector.

- (10) Momentarily touch other end of jumper wire to negative terminal of battery for no more than a few seconds.

- (11) Place a rag or towel below fuel line quick-connect fitting at fuel rail.

- (12) Disconnect quick-connect fitting at fuel rail. Refer to Quick-Connect Fittings.

- (13) Return fuel pump relay to PDC.

- (14) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB scan tool must be used to erase a DTC.

QUICK-CONNECT FITTINGS

Also refer to Fuel Tubes/Lines/Hoses and Clamps.

Different types of quick-connect fittings are used to attach various fuel system components, lines and tubes. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Safety latch clips are

SERVICE PROCEDURES (Continued)

used on certain components/lines. Certain fittings may require use of a special tool for disconnection.

DISCONNECTING

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSE, FITTING OR LINE, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

CAUTION: The interior components (o-rings, spacers) of some types of quick-connect fitting are not serviced separately. If service parts are not available, do not attempt to repair a damaged fitting or fuel line. If repair is necessary, replace complete fuel line assembly.

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this group.

(2) Disconnect negative battery cable from battery.

(3) Clean fitting of any foreign material before disassembly.

(4) **Single-Tab Type Fitting:** This type of fitting is equipped with a single pull tab (Fig. 13). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component.

(a) Press release tab on side of fitting to release pull tab (Fig. 14). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**

(b) While pressing release tab on side of fitting, use screwdriver to pry up pull tab (Fig. 14).

(c) Raise pull tab until it separates from quick-connect fitting (Fig. 15).

(5) **Two-Tab Type Fitting:** This type of fitting is equipped with tabs located on both sides of fitting (Fig. 16). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.

(a) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 16) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.

(b) Pull fitting from fuel system component being serviced.

(c) The plastic retainer will remain on component being serviced after fitting is disconnected. The o-rings and spacer will remain in quick-connect fitting connector body.

(6) **Plastic Retainer Ring Type Fitting:** This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 17) usually black in color.

J9414-25

Fig. 14 Disconnecting Single-Tab Type Fitting

- 1 - PULL TAB
- 2 - SCREWDRIVER
- 3 - QUICK-CONNECT FITTING

(a) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 17). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

(b) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(c) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

(7) **Latch Clips:** Depending on vehicle model and engine, 2 different types of safety latch clips are used (Fig. 18) or (Fig. 19). Type-1 is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.

(a) Type 1: Pry up on latch clip with a screwdriver (Fig. 18).

(b) Type 2: Separate and unlatch 2 small arms on end of clip (Fig. 19) and swing away from fuel line.

80a92a66

1 - SPECIAL FUEL LINE TOOL

2 - FUEL LINE

3 - FUEL RAIL

(d) Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (Fig. 20). Use tool to release locking fingers in end of line.

(e) With special tool still inserted, pull fuel line from fuel rail.

(f) After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

(8) Disconnect quick-connect fitting from fuel system component being serviced.

CONNECTING

(1) Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.

(2) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(3) Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.

(4) Continue pushing until a click is felt.

(5) Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.

(6) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(7) Latch Clip Equipped: Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail (or other fuel line). Recheck fuel line connection.**

(8) Connect negative cable to battery.

(9) Start engine and check for leaks.

REMOVAL AND INSTALLATION

FUEL FILTER/FUEL PRESSURE REGULATOR

The combination Fuel Filter/Fuel Pressure Regulator is located on the fuel pump module. The fuel pump module is located on top of fuel tank.

The filter/regulator may be removed without removing fuel pump module although fuel tank must be removed.

REMOVAL

(1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) Clean area around filter/regulator.

(3) Disconnect fuel line at filter/regulator. Refer to Quick-Connect Fittings in this group for procedures.

(4) Remove retainer clamp from top of filter/regulator (Fig. 21). Clamp snaps to tabs on pump module. Discard old clamp.

(5) Pry filter/regulator from top of pump module with 2 screwdrivers. Unit is snapped into module.

(6) Discard gasket below filter/regulator (Fig. 22).

(7) Before discarding filter/regulator assembly, inspect assembly to verify that o-rings (Fig. 23) are intact. If the smallest of the two o-rings can not be found on bottom of filter/regulator, it may be necessary to remove it from the fuel inlet passage in fuel pump module.

REMOVAL AND INSTALLATION (Continued)

- 6 - FUEL RETURN TO TANK

80a58b63

Fig. 22 Fuel Filter/Fuel Pressure Regulator Gasket

- 1 - TOP OF MODULE
- 2 - GASKET

INSTALLATION

- (1) Clean recessed area in pump module where filter/regulator is to be installed.
- (2) Obtain new filter/regulator (two new o-rings should already be installed).
- (3) Apply a small amount of clean engine oil to o-rings. **Do not install o-rings separately into**

fuel pump module. They will be damaged when installing filter/regulator.

- (4) Install new gasket to top of fuel pump module.
- (5) Press new filter/regulator into top of pump module until it snaps into position (a positive click must be heard or felt).
- (6) The arrow (Fig. 21) molded into top of fuel pump module should be pointed towards front of vehicle (12 o'clock position).
- (7) Rotate filter/regulator until fuel supply tube (fitting) is pointed towards front of vehicle (12 o'clock position).
- (8) Install new retainer clamp (clamp snaps over top of filter/regulator and locks to flanges on pump module).
- (9) Connect fuel line at filter/regulator. Refer to Quick-Connect Fittings in this group for procedures.
- (10) Install fuel tank. Refer to Fuel Tank Removal/Installation.

FUEL PUMP MODULE

Fuel tank removal will be necessary for fuel pump module removal.

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING THE FUEL PUMP MODULE, FUEL SYSTEM PRESSURE MUST BE RELEASED.

REMOVAL AND INSTALLATION (Continued)

- (1) Drain fuel tank and remove tank. Refer to the Fuel Tank Removal/Installation section of this group.
- (2) Thoroughly wash and clean area around pump module to prevent contaminants from entering tank.
- (3) Disconnect fuel line at filter/regulator. Refer to Quick-Connect Fittings in this group for procedures.
- (4) The plastic fuel pump module locknut is threaded onto fuel tank (Fig. 24). Install Special Tool 6856 to fuel pump module locknut and remove locknut (Fig. 25). The fuel pump module will spring up when locknut is removed.
- (5) Remove module from fuel tank.

Fig. 24 Top View of Fuel Tank and Fuel Pump Module

- 4 - FUEL PUMP MODULE
- 5 - FUEL FILTER/FUEL PRESSURE REGULATOR
- 6 - ALIGNMENT ARROW
- 7 - PIGTAIL HARNESS
- 8 - FUEL SUPPLY TUBE
- 9 - EVAP CANISTER VENT LINE

INSTALLATION

CAUTION: Whenever fuel pump module is serviced, module gasket must be replaced.

- (1) Thoroughly clean locknut threads and mating fuel tank threads. Use a soap/water solution. Do not use carburetor cleaner to clean threads.
- (2) Using a new gasket, position gasket and fuel pump module into opening in fuel tank.
- (3) Apply clean water to gasket and locknut threads.
- (4) Position locknut over top of fuel pump module.

Fig. 25 Locknut Removal/Installation—Typical

- 1 - SPECIAL TOOL 6856
- 2 - LOCKNUT

- (5) Rotate module until molded arrow (Fig. 24) is pointed toward front of vehicle (12 o'clock position). This step must be done to prevent float/float rod assembly from contacting sides of fuel tank.

- (6) Install Special Tool 6856 to locknut.
- (7) Tighten locknut to 74 N·m (55 ft. lbs.) torque.
- (8) Rotate fuel filter/fuel pressure regulator until its fitting is pointed toward front of vehicle (12 o'clock position).
- (9) Connect fuel line at filter/regulator. Refer to Quick-Connect Fittings in this group for procedures.
- (10) Install fuel tank. Refer to Fuel Tank Installation in this section.

FUEL PUMP INLET FILTER

The fuel pump inlet filter (strainer) is located on the bottom of fuel pump module (Fig. 26). The fuel pump module is located on top of fuel tank.

REMOVAL

- (1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.
- (2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.
- (3) Remove filter by prying from bottom of module with 2 screwdrivers. Filter is snapped to module.
- (4) Clean bottom of pump module.

INSTALLATION

- (1) Snap new filter to bottom of module.
- (2) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.
- (3) Install fuel tank. Refer to Fuel Tank Removal/Installation.

REMOVAL AND INSTALLATION (Continued)

**Fig. 26 Fuel Pump Inlet Filter**

- 1 - FUEL PUMP MODULE
2 - FUEL PUMP INLET FILTER

FUEL GAUGE SENDING UNIT

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump module (Fig. 27). The fuel pump module is located within the fuel tank.

REMOVAL

(1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.

**Fig. 28 Fuel Gauge Sending Unit Release Tab**

- 1 - ELECTRICAL CONNECTOR
2 - FUEL GAUGE SENDING UNIT
3 - RELEASE TAB
4 - FUEL PUMP MODULE

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Remove electrical wire connector at sending unit terminals.

(4) Press on release tab (Fig. 28) to remove sending unit from pump module.

INSTALLATION

(1) Position sending unit to pump module and snap into place.

(2) Connect electrical connector to terminals.

(3) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(4) Install fuel tank. Refer to Fuel Tank Removal/Installation.

FUEL INJECTOR RAIL/FUEL DAMPER—2.5L ENGINE**REMOVAL**

The fuel damper is not serviced separately.

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH ENGINE OFF. THIS PRESSURE MUST BE RELEASED BEFORE SERVICING FUEL RAIL.

(1) Remove fuel tank filler tube cap.

(2) Perform Fuel System Pressure Release Procedure as described in this Group.

(3) Disconnect negative battery cable from battery.

REMOVAL AND INSTALLATION (Continued)

(4) Remove air tube at top of throttle body. Note: Some engine/vehicles may require removal of air cleaner ducts at throttle body.

(5) Remove injector harness electrical connectors at each injector. Each injector connector should have a numerical tag attached identifying its corresponding cylinder (Fig. 29). If not, identify each connector before removal.

Fig. 29 Fuel Rail Mounting—2.5L Engine

- 1 - FUEL DAMPER
- 2 - FUEL INJECTOR
- 3 - NUMBERED TAG
- 4 - FUEL RAIL
- 5 - FUEL RAIL MOUNTING BOLTS/NUTS
- 6 - TEST PORT
- 7 - CABLE BRACKET

(6) Disconnect fuel supply line latch clip and fuel line at fuel rail. Refer to Quick-Connect Fittings in this group for procedures.

(7) Disconnect throttle cable at throttle body. Refer to Throttle Cable Removal/Installation in this group for procedures.

(8) Disconnect speed control cable at throttle body (if equipped). Refer to Speed Control Cable in Group 8H, Speed Control System for procedures.

(9) Disconnect automatic transmission cable at throttle body (if equipped).

(10) Remove cable routing bracket (Fig. 29) at intake manifold.

(11) Remove nut securing crankshaft position sensor pigtail harness to fuel rail mounting stud. Remove clamp and harness from fuel rail mounting stud.

(12) Clean dirt/debris from each fuel injector at intake manifold.

(13) Remove fuel rail mounting nuts/bolts (Fig. 29).

(14) Remove fuel rail by gently rocking until all the fuel injectors are out of intake manifold.

INSTALLATION

(1) Clean each injector bore at intake manifold.

(2) Apply a small amount of clean engine oil to each injector o-ring. This will aid in installation.

(3) Position tips of all fuel injectors into the corresponding injector bore in intake manifold. Seat injectors into manifold.

(4) Install and tighten fuel rail mounting bolts to 11 ± 3 N·m (100 ± 25 in. lbs.) torque.

(5) Position crankshaft position sensor pigtail wire harness clamp and wire harness to fuel rail mounting stud. Install nut securing harness to fuel rail mounting stud.

(6) Connect tagged injector harness connectors to appropriate injector.

(7) Connect fuel line and fuel line latch clip to fuel rail. Refer Quick-Connect Fittings in this group for procedures.

(8) Install protective cap to pressure test port fitting (if equipped).

(9) Install cable routing bracket to intake manifold.

(10) Connect throttle cable at throttle body.

(11) Connect speed control cable at throttle body (if equipped).

(12) Connect automatic transmission cable at throttle body (if equipped).

(13) Install air tube (or duct) at top of throttle body.

(14) Install fuel tank cap.

(15) Connect negative battery cable to battery.

(16) Start engine and check for fuel leaks.

FUEL INJECTOR RAIL/FUEL DAMPER—4.0L ENGINE

REMOVAL

The fuel damper is not serviced separately.

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH ENGINE OFF. THIS PRESSURE MUST BE RELEASED BEFORE SERVICING FUEL RAIL.

(1) Remove fuel tank filler tube cap.

(2) Perform Fuel System Pressure Release Procedure.

(3) Disconnect negative battery cable from battery.

(4) Remove air tube at top of throttle body. Note: Some engine/vehicles may require removal of air cleaner ducts at throttle body.

REMOVAL AND INSTALLATION (Continued)

(5) Disconnect electrical connectors at all 6 fuel injectors. To remove connector refer to (Fig. 30). Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

**Fig. 30 Remove/Install Fuel Injector Connector—
2.5L/4.0L Engine**

(6) Disconnect fuel supply line latch clip and fuel line at fuel rail. Refer to Quick-Connect Fittings.

(7) Disconnect throttle cable at throttle body. Refer to Throttle Cable Removal/Installation.

(8) Disconnect speed control cable at throttle body (if equipped). Refer to Speed Control Cable in Group 8H, Speed Control System.

(9) Disconnect automatic transmission cable at throttle body (if equipped).

(10) Remove cable routing bracket at intake manifold.

(11) If equipped, remove wiring harnesses at injection rail studs by removing nuts.

(12) Clean dirt/debris from each fuel injector at intake manifold.

(13) Remove fuel rail mounting nuts/bolts (Fig. 31).

(14) Remove fuel rail by gently rocking until all the fuel injectors are out of intake manifold.

80bfe150

Fig. 31 Fuel Rail Mounting—4.0L Engine

- 1 - INJ. #1
- 2 - INJ. #2
- 3 - INJ. #3
- 4 - INJ. #4
- 5 - INJ. #5
- 6 - INJ. #6
- 7 - FUEL INJECTOR RAIL
- 8 - FUEL DAMPER
- 9 - PRESSURE TEST PORT CAP
- 10 - MOUNTING BOLTS (4)
- 11 - QUICK-CONNECT FITTING

INSTALLATION

(1) Clean each injector bore at intake manifold.

(2) Apply a small amount of clean engine oil to each injector o-ring. This will aid in installation.

(3) Position tips of all fuel injectors into the corresponding injector bore in intake manifold. Seat injectors into manifold.

(4) Install and tighten fuel rail mounting bolts to 11 ± 3 N·m (100 ± 25 in. lbs.) torque.

(5) If equipped, connect wiring harnesses to injection rail studs.

(6) Connect electrical connectors at all fuel injectors. To install connector, refer to (Fig. 30). Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.

(7) Connect fuel line and fuel line latch clip to fuel rail. Refer Quick-Connect Fittings..

REMOVAL AND INSTALLATION (Continued)

- (8) Install protective cap to pressure test port fitting (if equipped).
- (9) Install cable routing bracket to intake manifold.
- (10) Connect throttle cable at throttle body.
- (11) Connect speed control cable at throttle body (if equipped).
- (12) Connect automatic transmission cable at throttle body (if equipped).
- (13) Install air tube (or duct) at top of throttle body.
- (14) Install fuel tank cap.
- (15) Connect negative battery cable to battery.
- (16) Start engine and check for fuel leaks.

FUEL INJECTORS

REMOVAL

- (1) Remove fuel rail. Refer to Fuel Injector Rail Removal in this section.
- (2) Disconnect clip(s) that retain fuel injector(s) to fuel rail (Fig. 32).

**Fig. 32 Fuel Injector Mounting**

- 1 - INLET FITTING
 2 - FUEL INJECTOR RAIL
 3 - CLIP
 4 - FUEL INJECTOR

INSTALLATION

- (1) Install fuel injector(s) into fuel rail assembly and install retaining clip(s).
- (2) If same injector(s) is being reinstalled, install new o-ring(s).
- (3) Apply a small amount of clean engine oil to each injector o-ring. This will aid in installation.
- (4) Install fuel rail. Refer to Fuel Rail Installation.
- (5) Start engine and check for fuel leaks.

FUEL TANK

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH THE ENGINE OFF. THIS PRESSURE MUST BE RELEASED BEFORE SERVICING FUEL TANK.

Two different procedures may be used to drain fuel tank (lowering tank or using DRB scan tool).

The quickest draining procedure involves lowering the fuel tank.

As an alternative procedure, the electric fuel pump may be activated allowing tank to be drained at fuel rail connection. Refer to DRB scan tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, release fuel pressure. Refer to the Fuel System Pressure Release Procedure in this group for procedures. Attach end of special test hose tool number 6541, 6539, 6631 or 6923 at fuel rail disconnection (tool number will depend on model and/or engine application). Position opposite end of this hose tool to an approved gasoline draining station. Activate fuel pump and drain tank until empty.

If electric fuel pump is not operating, tank must be lowered for fuel draining. Refer to following procedures.

REMOVAL

- (1) Disconnect negative battery cable at battery.
- (2) Release fuel system pressure. Refer to the Fuel System Pressure Release Procedure in this group.
- (3) Raise and support vehicle.
- (4) If Equipped: Remove fuel tank skid plate. Refer to Group 23, Body for procedures.
- (5) Remove 4 fuel hose shield mounting bolts and remove fuel hose shield (Fig. 33) from body.
- (6) Remove fuel tank fill hose and vent hose clamps at fuel tank filler tube (Fig. 34). Remove both hoses at fuel filler tube (Fig. 34).
- (7) Remove exhaust tailpipe heat shield mounting bolts and remove shield.

CAUTION: To protect fuel tank from exhaust heat, this shield must be reinstalled after tank installation.

- (8) Place a hydraulic jack to bottom of fuel tank.

WARNING: PLACE A SHOP TOWEL AROUND FUEL LINES TO CATCH ANY EXCESS FUEL.

(9) Disconnect fuel supply line from fuel extension line near front of fuel tank (Fig. 35). Refer to Fuel Tubes/Lines/Hoses and Clamps in this group. Also refer to Quick-Connect Fittings for procedures.

(10) Disconnect EVAP canister vent line near front of tank (Fig. 35).

REMOVAL AND INSTALLATION (Continued)

(11) Disconnect fuel pump module electrical connector (pigtail harness) near front of tank (Fig. 35). Harness connector is clipped to body.

(12) Remove two fuel tank strap nuts (Fig. 36). Position both tank support straps away from tank.

(13) Carefully lower right side of tank while feeding both fuel hoses through access hole in body. **Fuel Tank Full And Not Drained Using DRB Scan Tool:** To prevent fuel loss through hoses, keep left side of tank higher than right side while lowering.

Do not allow hose openings to drop lower than top of tank.

(14) Continue lowering tank until clear of vehicle. Place tank on floor with left side (hose side) higher than right side.

(15) Drain tank by removing fuel fill hose at tank. Fuel fill hose is largest of 2 hoses (Fig. 37). Insert the

REMOVAL AND INSTALLATION (Continued)

drain hose (from an approved gasoline draining station) into hose opening. Drain tank until empty.

(16) If fuel pump module removal is necessary, refer to Fuel Pump Module Removal/Installation in this group for procedures.

INSTALLATION

(1) If fuel pump module is being installed, refer to Fuel Pump Module Removal/Installation in this group for procedures.

(2) Install fuel fill/vent hoses to tank fittings. To prevent hose from kinking, rotate each hose until index mark on hose is aligned to index tang on fuel tank (Fig. 37).

(3) Install hose clamps to hoses. Position clamps between index marks on each hose (Fig. 37).

(4) Position fuel tank to hydraulic jack.

(5) Raise tank into position while guiding fuel fill and vent hoses into and through access hole in body.

(6) Continue raising tank until positioned to body.

(7) Attach two fuel tank mounting straps and mounting nuts. Tighten nuts to 10 N·m (90 in. lbs.) torque. Do not over tighten nuts.

(8) Install both fuel hoses to fuel fill tube. Tighten both retaining clamps.

(9) Position fuel hose shield to body. Install and tighten 4 mounting bolts.

(10) Connect fuel pump module pigtail harness electrical connector near front of tank.

(11) Connect fuel pump module supply line near front of tank. Refer to Quick-Connect Fittings for procedures.

(12) Connect EVAP hose near front of tank.

(13) Install exhaust tailpipe heat shield.

(14) Install fuel tank skid plate (if equipped).

(15) Lower vehicle and connect battery cable to battery.

FUEL TANK FILLER TUBE CAP**REMOVAL/INSTALLATION**

If replacement of the 1/4 turn fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

CAUTION: Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.

ACCELERATOR PEDAL**REMOVAL**

The accelerator pedal is connected to the throttle body linkage by the throttle cable. The cable is protected by a plastic sheathing and is connected to the throttle body linkage by a ball socket. It is connected to the upper part of the accelerator pedal arm by a plastic retainer (clip) (Fig. 38). This retainer (clip) snaps into the top of the accelerator pedal arm. Retainer tabs (built into the cable sheathing) (Fig. 38) fasten the cable to the dash panel.

Dual throttle return springs (attached to the throttle shaft) are used to close the throttle.

CAUTION: Never attempt to remove or alter these springs.

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing the accelerator pedal or throttle cable.

(1) From inside the vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of accelerator pedal arm (Fig. 38). Plastic cable retainer (clip) snaps into pedal arm.

(2) Remove accelerator pedal mounting bracket nuts. Remove accelerator pedal assembly.

REMOVAL AND INSTALLATION (Continued)

**Fig. 38 Accelerator Pedal Mounting—Typical**

- 1 - RETAINER TABS
- 2 - CLIP
- 3 - MOUNTING NUTS
- 4 - CABLE

INSTALLATION

(1) Place accelerator pedal assembly over studs protruding from floor pan. Tighten mounting nuts to 5 N·m (36 in. lbs.) torque.

(2) Slide throttle cable into opening in top of pedal arm. Push plastic cable retainer (clip) into accelerator pedal arm opening until it snaps into place.

(3) Before starting engine, operate accelerator pedal to check for any binding.

THROTTLE CABLE**REMOVAL**

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer (clip) and throttle cable core wire from upper end of accelerator pedal arm (Fig. 38). Plastic cable retainer (clip) snaps into pedal arm.

(2) Remove cable core wire at pedal arm.

(3) From inside vehicle, pinch both sides of cable housing retainer tabs (Fig. 38) at dash panel. Remove cable housing from dash panel and pull into engine compartment.

(4) Remove cable from cable guide on engine cylinder head (valve) cover.

(5) Remove throttle cable ball end socket at throttle body by pushing ball socket towards rear of vehicle (ball snaps off throttle body pin) (Fig. 39).

**Fig. 39 Throttle Cable at Throttle Body**

- 1 - ACCELERATOR CABLE
- 2 - OFF
- 3 - OFF
- 4 - THROTTLE BODY BELLCRANK
- 5 - SPEED CONTROL CABLE
- 6 - RELEASE TABS
- 7 - BRACKET

(6) Remove throttle cable from throttle body mounting bracket by compressing release tabs (Fig. 39) and pushing cable through hole in bracket.

(7) Remove throttle cable from vehicle.

INSTALLATION

(1) Slide throttle cable through hole in throttle body bracket until retainer tabs lock into bracket.

(2) Connect cable ball end to throttle body linkage ball (snaps on).

(3) Snap cable into cable guide on engine cylinder head (valve) cover.

(4) Push other end of cable through opening in dash panel until retaining tabs lock into panel.

(5) From inside drivers compartment, slide throttle cable core wire into opening in top of accelerator pedal arm. Push cable retainer (clip) into pedal arm opening until it snaps in place.

(6) Before starting engine, operate accelerator pedal to check for any binding.

SPECIFICATIONS

FUEL TANK CAPACITY

Models	Liters	U. S. Gallons
All	76	20
Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.		

FUEL SYSTEM PRESSURE

339 kPa \pm 34 kPa (49.2 psi \pm 2 psi).

FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded gasoline having an octane rating of 87. The use of premium gasoline is not recommended. The use of premium gasoline will provide no benefit over high quality regular gasoline, and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. We recommend the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as "reformulated" gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

We strongly supports the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country

during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. We recommend that gasolines free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. We recommend that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see on-board diagnostics system section.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives.

SPECIFICATIONS (Continued)

Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service. Contact your dealer for service assistance.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most

of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of Daimler-Chrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

DESCRIPTION AND OPERATION

POWERTRAIN CONTROL MODULE (PCM)

DESCRIPTION

The Powertrain Control Module (PCM) is located in the engine compartment (Fig. 1). The PCM is referred to as JTEC.

OPERATION

The PCM operates the fuel system. The PCM is a pre-programmed, triple microprocessor digital computer. It regulates ignition timing, air-fuel ratio, emission control devices, charging system, certain

transmission features, speed control, air conditioning compressor clutch engagement and idle speed. The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as Powertrain Control Module (PCM) Outputs. The sensors and switches that provide inputs to the PCM are considered Powertrain Control Module (PCM) Inputs.

The PCM adjusts ignition timing based upon inputs it receives from sensors that react to: engine rpm, manifold absolute pressure, engine coolant tem-

DESCRIPTION AND OPERATION (Continued)

**Fig. 1 PCM Location**

- 1 - (3) 32-WAY CONNECTORS
2 - PCM

perature, throttle position, transmission gear selection (automatic transmission), vehicle speed, power steering pump pressure (2.5L engine only), and the brake switch.

The PCM adjusts idle speed based on inputs it receives from sensors that react to: throttle position, vehicle speed, transmission gear selection, engine coolant temperature and from inputs it receives from the air conditioning clutch switch and brake switch.

Based on inputs that it receives, the PCM adjusts ignition coil dwell. The PCM also adjusts the generator charge rate through control of the generator field and provides speed control operation.

NOTE: PCM Inputs:

- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- Auto shutdown (ASD) sense
- Battery temperature
- Battery voltage
- Brake switch
- CCD bus (+) circuits
- CCD bus (-) circuits
- Camshaft position sensor signal
- Crankshaft position sensor
- Data link connection for DRB scan tool
- Engine coolant temperature sensor
- Extended idle switch (4.0L engine with police package)
 - Fuel level
 - Generator (battery voltage) output
 - Ignition circuit sense (ignition switch in on/off/crank/run position)
 - Intake manifold air temperature sensor
 - Leak detection pump (switch) sense (if equipped)

- Manifold absolute pressure (MAP) sensor
- Oil pressure
- Oxygen sensors
- Park/neutral switch (auto. trans. only)
- Power ground
- Power steering pressure switch (2.5L engine only)
 - Sensor return
 - Signal ground
 - Speed control multiplexed single wire input
 - Throttle position sensor
 - Vehicle speed sensor

NOTE: PCM Outputs:

- A/C clutch relay
- Auto shutdown (ASD) relay
- CCD bus (+/-) circuits for: speedometer, voltmeter, fuel gauge, oil pressure gauge/lamp, engine temp. gauge and speed control warn. lamp
 - Data link connection for DRB scan tool
 - EGR valve control solenoid (if equipped)
 - EVAP canister purge solenoid
 - Five volt sensor supply (primary)
 - Five volt sensor supply (secondary)
 - Fuel injectors
 - Fuel pump relay
 - Generator field driver (-)
 - Generator field driver (+)
 - Idle air control (IAC) motor
 - Ignition coil
 - Leak detection pump (if equipped)
 - Malfunction indicator lamp (Check engine lamp). Driven through CCD circuits.
 - Radiator cooling fan relay
 - Speed control vacuum solenoid
 - Speed control vent solenoid
 - Tachometer (if equipped). Driven through CCD circuits.
 - Transmission convertor clutch circuit

MODES OF OPERATION**OPERATION**

As input signals to the Powertrain Control Module (PCM) change, the PCM adjusts its response to the output devices. For example, the PCM must calculate different injector pulse width and ignition timing for idle than it does for wide open throttle (WOT).

The PCM will operate in two different modes: **Open Loop and Closed Loop.**

During Open Loop modes, the PCM receives input signals and responds only according to preset PCM programming. Input from the oxygen (O₂S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O₂S) sensors input. This input indicates

DESCRIPTION AND OPERATION (Continued)

to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O₂S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON
- Engine start-up (crank)
- Engine warm-up
- Idle
- Cruise
- Acceleration
- Deceleration
- Wide open throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The PCM pre-positions the idle air control (IAC) motor.
- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle position sensor (TPS) is monitored.
- The auto shutdown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O₂S sensor heater element is energized via the ASD relay. The O₂S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The PCM receives inputs from:

- Battery voltage
- Engine coolant temperature sensor

- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within 3 seconds of cranking the engine, it will shut down the fuel injection system.

The fuel pump is activated by the PCM through the fuel pump relay.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the PCM receives inputs from:

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM adjusts engine idle speed through the idle air control (IAC) motor and adjusts ignition timing.
- The PCM operates the A/C compressor clutch through the A/C compressor clutch relay. This is done if A/C has been selected by the vehicle operator and specified pressures are met at the high and low-pressure A/C switches. Refer to Group 24, Heating and Air Conditioning for additional information.
- When engine has reached operating temperature, the PCM will begin monitoring O₂S sensor input. The system will then leave the warm-up mode and go into closed loop operation.

DESCRIPTION AND OPERATION (Continued)

IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Extended idle switch (4.0L engine with police package only)
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Battery voltage
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen sensors
- Power steering pressure switch (2.5L engine only)

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by increasing and decreasing spark advance.
- The PCM operates the A/C compressor clutch through the A/C compressor clutch relay. This is done if A/C has been selected by the vehicle operator and specified pressures are met at the high and low-pressure A/C switches. Refer to Group 24, Heating and Air Conditioning for additional information.

The optional Extended Idle Switch is used to raise and hold the engine idle speed to approximately 1000 rpm. This is when the shifter is in either the Park or Neutral position and throttle pedal is not used. A rocker-type switch (extended idle switch) is mounted to the instrument panel. This switch will supply a ground circuit (input) to the PCM. **The switch is available only with 4.0L engine when supplied with optional police package.**

On 2.5L 4-cylinder engines, a power steering pressure switch is used to supply an input to the PCM when steering pump pressure is high. This will raise engine speed. Refer to Power Steering Pressure Switch in this group for additional information. **The 4.0L 6-cylinder engine does not use this switch.**

CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen (O2S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

ACCELERATION MODE

This is an Open Loop mode. The PCM recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased throttle opening.

DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the PCM receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Vehicle speed sensor

DESCRIPTION AND OPERATION (Continued)

If the vehicle is under hard deceleration with the proper rpm and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

Based on the above inputs, the PCM will adjust engine idle speed through the idle air control (IAC) motor.

The PCM adjusts ignition timing by turning the ground path to the coil on and off.

WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the PCM receives the following inputs.

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.

IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

AUTOMATIC SHUTDOWN (ASD) RELAY SENSE—PCM INPUT

DESCRIPTION

The ASD relay is located in the Power Distribution Center (PDC). The PDC is located in the engine compartment. Refer to label on PDC cover for relay location.

OPERATION

A 12 volt signal at this input indicates to the PCM that the ASD has been activated. The relay is used to

connect the oxygen sensor heater element, ignition coil and fuel injectors to 12 volt + power supply.

This input is used only to sense that the ASD relay is energized. If the powertrain control module (PCM) does not see 12 volts at this input when the ASD should be activated, it will set a diagnostic trouble code (DTC).

BATTERY VOLTAGE—PCM INPUT

OPERATION

The battery voltage input provides power to the Powertrain Control Module (PCM). It also informs the PCM what voltage level is supplied to the ignition coil and fuel injectors.

If battery voltage is low, the PCM will increase injector pulse width (period of time that the injector is energized). This is done to compensate for the reduced flow through injector caused by the lowered voltage.

BRAKE SWITCH—PCM INPUT

OPERATION

When the brake light switch is activated, the Powertrain Control Module (PCM) receives an input indicating that the brakes are being applied. After receiving this input, the PCM maintains idle speed to a scheduled rpm through control of the Idle Air Control (IAC) motor. The brake switch input is also used to disable vent and vacuum solenoid output signals to the speed control servo.

FIVE VOLT SENSOR SUPPLIES—PRIMARY AND SECONDARY

DESCRIPTION

Two different Powertrain Control Module (PCM) five volt supply circuits are used; primary and secondary.

OPERATION

These 2 circuits will:

- supply the required 5 volt power source to the Crankshaft Position (CKP) sensor.
- supply the required 5 volt power source to the Camshaft Position (CMP) sensor.
- supply a reference voltage for the Manifold Absolute Pressure (MAP) sensor.
- supply a reference voltage for the Throttle Position Sensor (TPS) sensor.
- supply the required 5 volt power source to the oil pressure sensor.
- supply the required 5 volt power source for the Vehicle Speed Sensor (VSS) (if equipped).

DESCRIPTION AND OPERATION (Continued)

- supply the 5 volt power source to the transmission pressure sensor (if equipped with an RE automatic transmission).

FUEL LEVEL SENSOR—PCM INPUT**DESCRIPTION**

The fuel level sensor (fuel gauge sending unit) is located on the fuel pump module.

OPERATION

Refer to Fuel Gauge Sending Unit in the Fuel Delivery section for information.

ENGINE COOLANT TEMPERATURE SENSOR—PCM INPUT**DESCRIPTION**

The Engine Coolant Temperature (ECT) sensor is used to sense engine coolant temperature. The sensor protrudes into an engine water jacket.

The ECT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as engine coolant temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

At key-on, the Powertrain Control Module (PCM) sends out a regulated 5 volt signal to the ECT sensor. The PCM then monitors the signal as it passes through the ECT sensor to the sensor ground (sensor return).

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

The PCM uses inputs from the ECT sensor for the following calculations:

- for engine coolant temperature gauge operation through CCD or PCI (J1850) communications
- Injector pulse-width
- Spark-advance curves
- ASD relay shut-down times
- Idle Air Control (IAC) motor key-on steps
- Pulse-width prime-shot during cranking
- O2 sensor closed loop times
- Purge solenoid on/off times
- EGR solenoid on/off times (if equipped)
- Leak Detection Pump operation (if equipped)
- Radiator fan relay on/off times (if equipped)
- Target idle speed

EXTENDED IDLE SWITCH—PCM INPUT**DESCRIPTION**

USED ONLY WITH OPTIONAL POLICE PACKAGE WHEN EQUIPPED WITH A 4.0L ENGINE: The extended idle switch is a rocker-type switch mounted to the instrument panel.

OPERATION

The extended idle switch is used to raise the engine idle speed to approximately 1000 rpm by supplying a ground circuit to the Powertrain Control Module (PCM). This idle speed control can only be operated when the shifter is in either the Park or Neutral position.

OXYGEN SENSOR—PCM INPUT**DESCRIPTION**

The Oxygen Sensors (O2S) are attached to, and protrude into the vehicle exhaust system. Depending on the emission package, the vehicle may contain either 2 or 4 sensors. On non-California emissions packages, 2 sensors are used: upstream (referred to as 1/1) and downstream (referred to as 1/2). On California emissions packages, 4 sensors are used: 2 upstream (referred to as 1/1 and 2/1) and 2 downstream (referred to as 1/2 and 2/2).

OPERATION

An O2 sensor is a galvanic battery that provides the PCM with a voltage signal (0-1 volt) inversely proportional to the amount of oxygen in the exhaust. In other words, if the oxygen content is low, the voltage output is high; if the oxygen content is high the output voltage is low. The PCM uses this information to adjust injector pulse-width to achieve the 14.7-to-1 air/fuel ratio necessary for proper engine operation and to control emissions.

An O2 sensor must have a source of oxygen from outside of the exhaust stream for comparison. Current O2 sensors receive their fresh oxygen (outside air) supply through the wire harness. This is why it is important to never solder an O2 sensor connector, or pack the connector with grease.

Four wires (circuits) are used on each O2 sensor: a 12-volt feed circuit for the sensor heating element; a ground circuit for the heater element; a low-noise sensor return circuit to the PCM, and an input circuit from the sensor back to the PCM to detect sensor operation.

Oxygen Sensor Heaters/Heater Relays: On a certain non-California emission package, the heaters on both sensors are fed battery voltage from the ASD relay which is controlled by the PCM. Refer to ASD relay for more information. On another non-Califor-

DESCRIPTION AND OPERATION (Continued)

nia emission package, the heaters on both sensors are fed battery voltage from the two O2S heater relays. The O2S relays are also controlled by the PCM. On the California emission package, the heaters on all 4 sensors are fed battery voltage from the two O2S Heater Relays.

The O2 sensor uses a Positive Thermal Co-efficient (PTC) heater element. As temperature increases, resistance increases. At ambient temperatures around 70°F, the resistance of the heating element is approximately 6 ohms. As the sensor's temperature increases, resistance in the heater element increases. This allows the heater to maintain the optimum operating temperature of approximately 930°-1100°F (500°-600° C). Although the sensors operate the same, there are physical differences, due to the environment that they operate in, that keep them from being interchangeable.

Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors certain O2 sensor input(s) along with other inputs, and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

Upstream Sensor (Non-California Emissions): The upstream O2S sensor (1/1 sensor) is located in the exhaust downpipe before the catalytic convertor. It provides an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensor. The PCM will change the air/fuel ratio until the upstream sensor inputs a voltage that the PCM has determined will make the downstream sensor output (oxygen content) correct.

The upstream oxygen sensor also provides an input to determine catalyst efficiency.

Downstream Sensor (Non-California Emissions): The downstream heated oxygen sensor (1/2 sensor) is located near the outlet end of the catalytic convertor. The downstream sensor is also used to determine the correct air fuel ratio. As the oxygen content changes at the downstream the PCM calculates how much air fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensor also provides an input to determine catalyst efficiency.

Upstream Sensors (California Emissions): Two upstream sensors are used (1/1 and 2/1). The 1/1 sensor is the first sensor to receive exhaust gases from the #1 cylinder. Both of the upstream O2S sensors are located in the exhaust manifold just before the mini-catalytic convertors. They provide an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensors. The PCM will change the air/fuel ratio until the upstream sensors input a voltage that the PCM has determined will make the downstream sensors output (oxygen content) correct.

The upstream oxygen sensors also provide an input to determine mini-catalyst efficiency.

Downstream Sensors (California Emissions): Two downstream sensors are used (1/2 and 2/2). The downstream sensors are located in the exhaust downpipes just after the mini-catalytic convertors. The downstream is also used to determine the correct air fuel ratio. As the oxygen content changes at the downstream the PCM calculates how much air fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensors also provide an input to determine mini-catalyst efficiency.

IGNITION CIRCUIT SENSE—PCM INPUT

DESCRIPTION

This circuit ties the ignition switch to the Powertrain Control Module (PCM).

OPERATION

The ignition circuit sense input tells the PCM the ignition switch has energized the ignition circuit.

Battery voltage is also supplied to the PCM through the ignition switch when the ignition is in the RUN or START position. This is referred to as the "ignition sense" circuit and is used to "wake up" the PCM. Voltage on the ignition input can be as low as 6 volts and the PCM will still function. Voltage is supplied to this circuit to power the PCM's 8-volt regulator and to allow the PCM to perform fuel, ignition and emissions control functions. The battery voltage on this line is supplied to the 8-volt regulator which then passes on a power-up supply to the 5-volt regulator.

DESCRIPTION AND OPERATION (Continued)

INTAKE MANIFOLD AIR TEMPERATURE SENSOR—PCM INPUT**DESCRIPTION**

The 2-wire Intake Manifold Air Temperature (IAT) sensor is installed in the intake manifold with the sensor element extending into the air stream.

The IAT sensor is a two-wire Negative Thermal Coefficient (NTC) sensor. Meaning, as intake manifold temperature increases, resistance (voltage) in the sensor decreases. As temperature decreases, resistance (voltage) in the sensor increases.

OPERATION

The IAT sensor provides an input voltage to the Powertrain Control Module (PCM) indicating the density of the air entering the intake manifold based upon intake manifold temperature. At key-on, a 5-volt power circuit is supplied to the sensor from the PCM. The sensor is grounded at the PCM through a low-noise, sensor-return circuit.

The PCM uses this input to calculate the following:

- Injector pulse-width
- Adjustment of spark timing (to help prevent spark knock with high intake manifold air-charge temperatures)

The resistance values of the IAT sensor is the same as for the Engine Coolant Temperature (ECT) sensor.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR—PCM INPUT**DESCRIPTION**

The Manifold Absolute Pressure (MAP) sensor is attached to the side of the engine throttle body with 2 screws. The sensor is connected to the throttle body with a rubber L-shaped fitting.

OPERATION

The MAP sensor is used as an input to the Powertrain Control Module (PCM). It contains a silicon based sensing unit to provide data on the manifold vacuum that draws the air/fuel mixture into the combustion chamber. The PCM requires this information to determine injector pulse width and spark advance. When manifold absolute pressure (MAP) equals Barometric pressure, the pulse width will be at maximum.

A 5 volt reference is supplied from the PCM and returns a voltage signal to the PCM that reflects manifold pressure. The zero pressure reading is 0.5V and full scale is 4.5V. For a pressure swing of 0–15 psi, the voltage changes 4.0V. To operate the sensor, it is supplied a regulated 4.8 to 5.1 volts. Ground is provided through the low-noise, sensor return circuit at the PCM.

The MAP sensor input is the number one contributor to fuel injector pulse width. The most important function of the MAP sensor is to determine barometric pressure. The PCM needs to know if the vehicle is at sea level or at a higher altitude, because the air density changes with altitude. It will also help to correct for varying barometric pressure. Barometric pressure and altitude have a direct inverse correlation; as altitude goes up, barometric goes down. At key-on, the PCM powers up and looks at MAP voltage, and based upon the voltage it sees, it knows the current barometric pressure (relative to altitude). Once the engine starts, the PCM looks at the voltage again, continuously every 12 milliseconds, and compares the current voltage to what it was at key-on. The difference between current voltage and what it was at key-on, is manifold vacuum.

During key-on (engine not running) the sensor reads (updates) barometric pressure. A normal range can be obtained by monitoring a known good sensor.

As the altitude increases, the air becomes thinner (less oxygen). If a vehicle is started and driven to a very different altitude than where it was at key-on, the barometric pressure needs to be updated. Any time the PCM sees Wide Open Throttle (WOT), based upon Throttle Position Sensor (TPS) angle and RPM, it will update barometric pressure in the MAP memory cell. With periodic updates, the PCM can make its calculations more effectively.

The PCM uses the MAP sensor input to aid in calculating the following:

- Manifold pressure
- Barometric pressure
- Engine load
- Injector pulse-width
- Spark-advance programs
- Shift-point strategies (certain automatic transmissions only)
- Idle speed
- Decel fuel shutoff

The MAP sensor signal is provided from a single piezoresistive element located in the center of a diaphragm. The element and diaphragm are both made of silicone. As manifold pressure changes, the diaphragm moves causing the element to deflect, which stresses the silicone. When silicone is exposed to stress, its resistance changes. As manifold vacuum increases, the MAP sensor input voltage decreases proportionally. The sensor also contains electronics that condition the signal and provide temperature compensation.

The PCM recognizes a decrease in manifold pressure by monitoring a decrease in voltage from the reading stored in the barometric pressure memory cell. The MAP sensor is a linear sensor; meaning as pressure changes, voltage changes proportionately.

DESCRIPTION AND OPERATION (Continued)

The range of voltage output from the sensor is usually between 4.6 volts at sea level to as low as 0.3 volts at 26 in. of Hg. Barometric pressure is the pressure exerted by the atmosphere upon an object. At sea level on a standard day, no storm, barometric pressure is approximately 29.92 in Hg. For every 100 feet of altitude, barometric pressure drops .10 in. Hg. If a storm goes through it can change barometric pressure from what should be present for that altitude. You should know what the average pressure and corresponding barometric pressure is for your area.

OIL PRESSURE SENSOR—PCM INPUT

DESCRIPTION

The 3-wire, solid-state engine oil pressure sensor (sending unit) is located in an engine oil pressure gallery.

OPERATION

The oil pressure sensor uses three circuits. They are:

- A 5-volt power supply from the Powertrain Control Module (PCM)
- A sensor ground through the PCM's sensor return
- A signal to the PCM relating to engine oil pressure

The oil pressure sensor has a 3-wire electrical function very much like the Manifold Absolute Pressure (MAP) sensor. Meaning different pressures relate to different output voltages.

A 5-volt supply is sent to the sensor from the PCM to power up the sensor. The sensor returns a voltage signal back to the PCM relating to engine oil pressure. This signal is then transferred (bussed) to the instrument panel on either a CCD or PCI bus circuit (depending on vehicle line) to operate the oil pressure gauge and the check gauges lamp. Ground for the sensor is provided by the PCM through a low-noise sensor return.

POWER GROUNDS

OPERATION

The Powertrain Control Module (PCM) has 2 main grounds. Both of these grounds are referred to as power grounds. All of the high-current, noisy, electrical devices are connected to these grounds as well as all of the sensor returns. The sensor return comes into the sensor return circuit, passes through noise suppression, and is then connected to the power ground.

The power ground is used to control ground circuits for the following PCM loads:

- Generator field winding
- Fuel injectors
- Ignition coil(s)
- Certain relays/solenoids
- Certain sensors

POWER STEERING PRESSURE SWITCH—PCM INPUT

DESCRIPTION

A pressure sensing switch (Fig. 2) is included in the power steering system (mounted on the high-pressure line). This switch will be used only on vehicles equipped with a 2.5L engine and power steering.

Fig. 2 Power Steering Pump Pressure Switch—2.5L Engine

- 1 - POWER STEERING PRESSURE SWITCH
- 2 - ELECTRICAL CONNECTOR
- 3 - POWER STEERING PUMP

OPERATION

The power steering pressure switch provides an input to the Powertrain Control Module (PCM). This input is provided during periods of high pump load and low engine rpm; such as during parking maneuvers. The PCM will then increase the idle speed through the Idle Air Control (IAC) motor. This is done to prevent the engine from stalling under the increased load.

When steering pump pressure exceeds 3275 kPa \pm 690 kPa (475 psi \pm 100 psi), the normally closed switch will open and the PCM will increase the engine idle speed. This will prevent the engine from stalling.

DESCRIPTION AND OPERATION (Continued)

When pump pressure drops to approximately 1379 kPa (200 psi), the switch circuit will re-close and engine idle speed will return to its previous setting.

SENSOR RETURN—PCM INPUT**OPERATION**

The Sensor Return circuits are internal to the Powertrain Control Module (PCM).

Sensor Return provides a low-noise ground reference for all engine control system sensors. Refer to Power Grounds for more information.

THROTTLE POSITION SENSOR (TPS)—PCM INPUT**DESCRIPTION**

The 3-wire Throttle Position Sensor (TPS) is mounted on the throttle body and is connected to the throttle blade.

OPERATION

The TPS is a 3-wire variable resistor that provides the Powertrain Control Module (PCM) with an input signal (voltage) that represents the throttle blade position of the throttle body. The sensor is connected to the throttle blade shaft. As the position of the throttle blade changes, the resistance (output voltage) of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range of from .26 volts at minimum throttle opening (idle), to 4.49 volts at wide open throttle. Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. In response to engine operating conditions, the PCM will adjust fuel injector pulse width and ignition timing.

The PCM needs to identify the actions and position of the throttle blade at all times. This information is needed to assist in performing the following calculations:

- Ignition timing advance
- Fuel injection pulse-width
- Idle (learned value or minimum TPS)
- Off-idle (0.06 volt)
- Wide Open Throttle (WOT) open loop (2.608 volts above learned idle voltage)
 - Deceleration fuel lean out
 - Fuel cutoff during cranking at WOT (2.608 volts above learned idle voltage)
 - A/C WOT cutoff (certain automatic transmissions only)

VEHICLE SPEED AND DISTANCE SENSOR—PCM INPUT**DESCRIPTION**

The 3-wire Vehicle Speed Sensor (VSS) is located on the speedometer pinion gear adapter. If equipped with 4WD, this adapter is located on the extension housing of the transfer case (drivers side). If equipped with 2WD, this adapter is located on the left side of the transmission extension housing.

OPERATION

The VSS is a 3-circuit (3-wire), magnetic, hall-effect sensor.

The 3 circuits are:

- A 5-volt power supply from the Powertrain Control Module (PCM).
- A ground is provided for the sensor through a low-noise sensor return circuit in the PCM.
- An input to the PCM is used to determine vehicle speed and distance traveled.

The speed sensor generates 8 pulses per sensor revolution. These signals, in conjunction with a closed throttle signal from the throttle position sensor, indicate a closed throttle deceleration to the PCM. When the vehicle is stopped at idle, a closed throttle signal is received by the PCM (but a speed sensor signal is not received).

Under deceleration conditions, the PCM adjusts the Idle Air Control (IAC) motor to maintain a desired MAP value. Under idle conditions, the PCM adjusts the IAC motor to maintain a desired engine speed.

AUTO SHUTDOWN (ASD) RELAY—PCM OUTPUT**DESCRIPTION**

The 5-pin, 12-volt, Automatic Shutdown (ASD) relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

OPERATION

The ASD relay supplies battery voltage (12+ volts) to the fuel injectors and ignition coil(s). With certain emissions packages it also supplies 12-volts to the oxygen sensor heating elements.

The ground circuit for the coil within the ASD relay is controlled by the Powertrain Control Module (PCM). The PCM operates the ASD relay by switching its ground circuit on and off.

The ASD relay will be shut-down, meaning the 12-volt power supply to the ASD relay will be deactivated by the PCM if:

DESCRIPTION AND OPERATION (Continued)

- the ignition key is left in the ON position. This is if the engine has not been running for approximately 1.8 seconds.

- there is a crankshaft position sensor signal to the PCM that is lower than pre-determined values.

The PCM will sense if or when the ASD relay has been activated through a “sense circuit”. Refer to Automatic Shut-Down (ASD) Relay Sense-PCM Input for additional information.

CCD BUS (+/-) CIRCUITS-PCM OUTPUTS

OPERATION

The Powertrain Control Module (PCM) sends certain output signals through the CCD bus circuits. These signals are used to control certain instrument panel located items and to determine certain identification numbers.

Refer to Group 8E, Instrument Panel and Gauges for additional information.

DATA LINK CONNECTOR—PCM INPUT AND OUTPUT

DESCRIPTION

The data link connector is located at the lower edge of the instrument panel near the steering column.

OPERATION

The 16-way data link connector (diagnostic scan tool connector) links the Diagnostic Readout Box (DRB) scan tool or the Mopar Diagnostic System (MDS) with the Powertrain Control Module (PCM).

FUEL INJECTORS—PCM OUTPUT

DESCRIPTION

The fuel injectors are connected to the engine with the fuel injector rail.

OPERATION

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The injectors are energized individually in a sequential order by the Powertrain Control Module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust

injector pulse width based on various inputs it receives.

Battery voltage (12 volts +) is supplied to the injectors through the ASD relay. The ASD relay will shut-down the 12 volt power source to the fuel injectors if the PCM senses the ignition is on, but the engine is not running. This occurs after the engine has not been running for approximately 1.8 seconds.

The PCM determines injector on-time (pulse width) based on various inputs.

FUEL PUMP RELAY-PCM OUTPUT

DESCRIPTION

The 5-pin, 12-volt, fuel pump relay is located in the Power Distribution Center (PDC). Refer to the label on the PDC cover for relay location.

OPERATION

The Powertrain Control Module (PCM) energizes the electric fuel pump through the fuel pump relay. The fuel pump relay is energized by first applying battery voltage to it when the ignition key is turned ON, and then applying a ground signal to the relay from the PCM.

Whenever the ignition key is turned ON, the electric fuel pump will operate. But, the PCM will shut-down the ground circuit to the fuel pump relay in approximately 1–3 seconds unless the engine is operating or the starter motor is engaged.

IDLE AIR CONTROL (IAC) MOTOR—PCM OUTPUT

DESCRIPTION

The IAC stepper motor is mounted to the throttle body, and regulates the amount of air bypassing the control of the throttle plate. As engine loads and ambient temperatures change, engine rpm changes. A pintle on the IAC stepper motor protrudes into a passage in the throttle body, controlling air flow through the passage. The IAC is controlled by the Powertrain Control Module (PCM) to maintain the target engine idle speed.

OPERATION

At idle, engine speed can be increased by retracting the IAC motor pintle and allowing more air to pass through the port, or it can be decreased by restricting the passage with the pintle and diminishing the amount of air bypassing the throttle plate.

The IAC is called a stepper motor because it is moved (rotated) in steps, or increments. Opening the IAC opens an air passage around the throttle blade which increases RPM.

DESCRIPTION AND OPERATION (Continued)

The PCM uses the IAC motor to control idle speed (along with timing) and to reach a desired MAP during decel (keep engine from stalling).

The IAC motor has 4 wires with 4 circuits. Two of the wires are for 12 volts and ground to supply electrical current to the motor windings to operate the stepper motor in one direction. The other 2 wires are also for 12 volts and ground to supply electrical current to operate the stepper motor in the opposite direction.

To make the IAC go in the opposite direction, the PCM just reverses polarity on both windings. If only 1 wire is open, the IAC can only be moved 1 step (increment) in either direction. To keep the IAC motor in position when no movement is needed, the PCM will energize both windings at the same time. This locks the IAC motor in place.

In the IAC motor system, the PCM will count every step that the motor is moved. This allows the PCM to determine the motor pintle position. If the memory is cleared, the PCM no longer knows the position of the pintle. So at the first key ON, the PCM drives the IAC motor closed, regardless of where it was before. This zeros the counter. From this point the PCM will back out the IAC motor and keep track of its position again.

When engine rpm is above idle speed, the IAC is used for the following:

- Off-idle dashpot (throttle blade will close quickly but idle speed will not stop quickly)
- Deceleration air flow control
- A/C compressor load control (also opens the passage slightly before the compressor is engaged so that the engine rpm does not dip down when the compressor engages)
- Power steering load control

The PCM can control polarity of the circuit to control direction of the stepper motor.

IAC Stepper Motor Program: The PCM is also equipped with a memory program that records the number of steps the IAC stepper motor most recently advanced to during a certain set of parameters. For example: The PCM was attempting to maintain a 1000 rpm target during a cold start-up cycle. The last recorded number of steps for that may have been 125. That value would be recorded in the memory cell so that the next time the PCM recognizes the identical conditions, the PCM recalls that 125 steps were required to maintain the target. This program allows for greater customer satisfaction due to greater control of engine idle.

Another function of the memory program, which occurs when the power steering switch (if equipped), or the A/C request circuit, requires that the IAC stepper motor control engine rpm, is the recording of the last targeted steps into the memory cell. The PCM

can anticipate A/C compressor loads. This is accomplished by delaying compressor operation for approximately 0.5 seconds until the PCM moves the IAC stepper motor to the recorded steps that were loaded into the memory cell. Using this program helps eliminate idle-quality changes as loads change. Finally, the PCM incorporates a "No-Load" engine speed limiter of approximately 1800 - 2000 rpm, when it recognizes that the TPS is indicating an idle signal and IAC motor cannot maintain engine idle.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the IAC motor through the PCM.

RADIATOR FAN RELAY—PCM OUTPUT

DESCRIPTION

The electric radiator cooling fan relay is located in the Power Distribution Center (PDC).

OPERATION

An electric radiator cooling fan is used with certain models/engines. It is controlled by the Powertrain Control Module (PCM) through the radiator fan relay. **Not Equipped With A/C:** The relay is energized when coolant temperature is above 103°C (217°F). It will then de-energize when coolant temperature drops to 98°C (208°F). Refer to Cooling Systems for additional information. **Equipped With A/C:** In addition to using coolant temperatures to control cooling fan operation, a two-gang A/C high-pressure switch is also used to control cooling fan operation. When equipped with this high-pressure switch, the cooling fan **will not operate** each time the A/C clutch is engaged. Refer to Heating and Air Conditioning for additional information.

THROTTLE BODY

DESCRIPTION

The throttle body is located on the intake manifold. Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors.

OPERATION

Filtered air from the air cleaner enters the intake manifold through the throttle body. The throttle body contains an air control passage controlled by an Idle Air Control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

Certain sensors are attached to the throttle body. The accelerator pedal cable, speed control cable and

DESCRIPTION AND OPERATION (Continued)

transmission control cable (when equipped) are connected to the throttle body linkage arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

DIAGNOSIS AND TESTING

VISUAL INSPECTION

A visual inspection for loose, disconnected or incorrectly routed wires and hoses should be made. This should be done before attempting to diagnose or service the fuel injection system. A visual check will help spot these faults and save unnecessary test and diagnostic time. A thorough visual inspection will include the following checks:

(1) Verify the three 32-way electrical connectors are fully inserted into the connector of the Powertrain Control Module (PCM) (Fig. 3).

Fig. 3 Powertrain Control Module (PCM)

- 1 - (3) 32-WAY CONNECTORS
2 - PCM

(2) Inspect battery cable connections. Be sure they are clean and tight.

(3) Inspect fuel pump relay and air conditioning compressor clutch relay (if equipped). Inspect ASD relay connections. Inspect starter motor relay connections. Inspect relays for signs of physical damage and corrosion. The relays are located in Power Distribution Center (PDC) (Fig. 4). Refer to label on PDC cover for relay location.

(4) 2.5L Engine: Inspect ignition coil primary connection. Verify coil secondary cable is firmly connected to coil (Fig. 5).

(5) 4.0L Engine: Inspect ignition coil connection (Fig. 6).

Fig. 4 Power Distribution Center (PDC)

- 1 - POWER DISTRIBUTION CENTER (PDC)

Fig. 5 Ignition Coil—2.5L Engine

- 1 - IGNITION COIL
2 - ELECTRICAL CONNECTOR
3 - MOUNTING BOLTS
4 - SECONDARY CABLE

(6) 2.5L Engine: Verify that distributor cap is correctly attached to distributor. Be sure that spark plug cables are firmly connected to the distributor cap and spark plugs are in their correct firing order. Be sure that coil cable is firmly connected to distributor cap and coil.

DIAGNOSIS AND TESTING (Continued)

- 4 - RELEASE LOCK
- 5 - COIL CONNECTOR

(7) Connect vehicle to an oscilloscope and inspect spark events for fouled or damaged spark plugs or cables.

(8) Verify generator output wire, generator connector and ground wire are firmly connected to generator.

(9) Inspect system body grounds for loose or dirty connections. Refer to Group 8, Wiring for ground locations.

(10) Verify crankcase ventilation (CCV) operation. Refer to Group 25, Emission Control System for additional information.

(11) Inspect fuel tube quick-connect fitting-to-fuel rail connections.

(12) Verify hose connections to all ports of vacuum fittings on intake manifold are tight and not leaking.

(13) Inspect accelerator cable, transmission throttle cable (if equipped) and cruise control cable connections (if equipped). Check their connections to throttle arm of throttle body for any binding or restrictions.

(14) If equipped with vacuum brake booster, verify vacuum booster hose is firmly connected to fitting on

intake manifold. Also check connection to brake vacuum booster.

(15) Inspect air cleaner inlet and air cleaner element for dirt or restrictions.

(16) Inspect radiator grille area, radiator fins and air conditioning condenser for restrictions.

(17) Verify intake manifold air temperature sensor wire connector is firmly connected to harness connector (Fig. 7) or (Fig. 8).

**Fig. 7 Intake Manifold Air Temp. Sensor Location—2.5L Engine**

- 1 - ELECTRICAL CONNECTOR
- 2 - INTAKE MANIFOLD TEMPERATURE SENSOR
- 3 - FUEL INJECTOR

(18) Verify MAP sensor electrical connector is firmly connected to MAP sensor (Fig. 8). Also verify rubber L-shaped fitting from MAP sensor to throttle body is firmly connected (Fig. 9).

(19) Verify fuel injector wire harness connectors are firmly connected to injectors in correct order. Each harness connector is numerically tagged with injector number (INJ 1, INJ 2 etc.) of its corresponding fuel injector and cylinder number.

(20) Verify harness connectors are firmly connected to idle air control (IAC) motor and throttle position sensor (TPS) (Fig. 8).

(21) Verify wire harness connector is firmly connected to engine coolant temperature sensor (Fig. 10).

(22) Raise and support vehicle.

(24) Inspect for pinched or leaking fuel tubes. Inspect for pinched, cracked or leaking fuel hoses.

(25) Inspect for exhaust system restrictions such as pinched exhaust pipes, collapsed muffler or plugged catalytic converter.

(26) If equipped with automatic transmission, verify electrical harness is firmly connected to park/neutral switch. Refer to Automatic Transmission section of Group 21.

(27) Verify that electrical harness connector is firmly connected to the vehicle speed sensor (Fig. 15).

(28) 2.5L 4-Cylinder Engine Only: Verify good electrical connection at power steering pressure switch (Fig. 16). This switch is not used with 4.0L engines.

(29) Verify good electrical connections at fuel pump module connector at front of fuel tank (Fig. 17).

(30) Verify good EVAP canister vent line connection at front of fuel tank (Fig. 17).

(31) Verify good fuel supply line connection at front of fuel tank (Fig. 17).

(32) Inspect all fuel lines/hoses for cracks or leaks.

(33) Inspect transmission torque converter housing (automatic transmission) or clutch housing (manual transmission) for damage to timing ring on drive plate/flywheel.

(34) Verify battery cable and solenoid feed wire connections to starter solenoid are tight and clean. Inspect for chaffed wires or wires rubbing up against other components.

ASD AND FUEL PUMP RELAYS

The following description of operation and tests apply only to the Automatic Shutdown (ASD) and fuel pump relays. The terminals on the bottom of each relay are numbered. Two different types of relays may be used, (Fig. 18) or (Fig. 19).

Fig. 18 ASD and Fuel Pump Relay Terminals—Type 1

DIAGNOSIS AND TESTING (Continued)

Fig. 19 ASD and Fuel Pump Relay Terminals—Type 2

OPERATION

- Terminal number 30 is connected to battery voltage. For both the ASD and fuel pump relays, terminal 30 is connected to battery voltage at all times.
- The PCM grounds the coil side of the relay through terminal number 85.
- Terminal number 86 supplies voltage to the coil side of the relay.
- When the PCM de-energizes the ASD and fuel pump relays, terminal number 87A connects to terminal 30. This is the Off position. In the off position, voltage is not supplied to the rest of the circuit. Terminal 87A is the center terminal on the relay.
- When the PCM energizes the ASD and fuel pump relays, terminal 87 connects to terminal 30. This is the On position. Terminal 87 supplies voltage to the rest of the circuit.

TESTING

The following procedure applies to the ASD and fuel pump relays.

- (1) Remove relay from connector before testing.
- (2) With the relay removed from the vehicle, use an ohmmeter to check the resistance between terminals 85 and 86. The resistance should be between 75 \pm 5 ohms.
- (3) Connect the ohmmeter between terminals 30 and 87A. The ohmmeter should show continuity between terminals 30 and 87A.
- (4) Connect the ohmmeter between terminals 87 and 30. The ohmmeter should not show continuity at this time.

(5) Connect one end of a jumper wire (16 gauge or smaller) to relay terminal 85. Connect the other end of the jumper wire to the ground side of a 12 volt power source.

(6) Connect one end of another jumper wire (16 gauge or smaller) to the power side of the 12 volt power source. **Do not attach the other end of the jumper wire to the relay at this time.**

WARNING: DO NOT ALLOW OHMMETER TO CONTACT TERMINALS 85 OR 86 DURING THIS TEST.

(7) Attach the other end of the jumper wire to relay terminal 86. This activates the relay. The ohmmeter should now show continuity between relay terminals 87 and 30. The ohmmeter should not show continuity between relay terminals 87A and 30.

(8) Disconnect jumper wires.

(9) Replace the relay if it did not pass the continuity and resistance tests. If the relay passed the tests, it operates properly. Check the remainder of the ASD and fuel pump relay circuits. Refer to the Wiring Diagrams.

THROTTLE BODY MINIMUM AIR FLOW CHECK PROCEDURE

The following test procedure has been developed to check throttle body calibrations for correct idle conditions. The procedure should be used to diagnose the throttle body for conditions that may cause idle problems. **This procedure should be used only after normal diagnostic procedures have failed to produce results that indicate a throttle body related problem. Be sure to check for proper operation of the idle air control motor before performing this test.**

A special fixed orifice tool (number 6714) (Fig. 20) must be used for the following test. This tool has a fixed internal diameter of 0.185".

SPECIAL TOOL 6714

J9414-7

Fig. 20 6714 Fixed Orifice Tool

DIAGNOSIS AND TESTING (Continued)

(1) Start the engine and bring to operating temperature. Be sure all accessories are off before performing this test.

(2) Shut off engine and remove air duct at throttle body.

(3) **2.5L 4-Cylinder Engine:** Near front/top of valve cover, disconnect CCV tube at fixed orifice fitting (Fig. 21). Insert Special Tool 6714 into end of disconnected CCV tube (insert either end of tool into tube). Let tool and tube hang disconnected at side of engine.

(4) **4.0L 6-Cylinder Engine:** Disconnect CCV tube (Fig. 22) at intake manifold fitting. Attach a short piece of rubber hose to special tool 6714 (insert rubber hose to either end of tool). Install rubber hose/tool to intake manifold fitting. Let CCV tube hang disconnected at side of engine.

8056d9f4

Fig. 21 Install Orifice Tool 2.5L 4-Cylinder Engine

- 1 - AIR INLET FITTING
- 2 - AIR FILTER COVER
- 3 - FIXED ORIFICE FITTING

(5) Connect DRB scan tool to 16-way data link connector. This connector is located at lower edge of instrument panel near steering column. Refer to appropriate Powertrain Diagnostic Procedures service manual for DRB operation.

(6) Start engine and allow to warm up.

(7) Using the DRB scan tool, scroll through menus as follows: select—Stand Alone DRB III, select the year 2000 Diagnostics, select—Engine, select—System Test, select—Minimum Air Flow.

(8) The DRB scan tool will count down to stabilize idle rpm and display minimum air flow idle rpm. The

8056d9f5

Fig. 22 Install Orifice Tool 4.0L 6-Cylinder Engine

- 1 - AIR INLET FITTING
- 2 - FIXED ORIFICE FITTING
- 3 - AIR FILTER COVER

idle rpm should be between **500 and 900 rpm**. If idle speed is outside these specifications, replace throttle body. Refer to Throttle Body Removal/Installation.

(9) Disconnect DRB scan tool from vehicle.

(10) Remove orifice tool and connect CCV tube to engine.

(11) Install air duct to throttle body.

REMOVAL AND INSTALLATION

AUTOMATIC SHUTDOWN (ASD) RELAY

The ASD relay is located in the Power Distribution Center (PDC) (Fig. 23). Refer to label on PDC cover for relay location.

REMOVAL

- (1) Remove PDC cover.
- (2) Remove relay from PDC.
- (3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
- (4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

- (1) Install relay to PDC.
- (2) Install cover to PDC.

REMOVAL AND INSTALLATION (Continued)

Fig. 23 Power Distribution Center (PDC)

1 - POWER DISTRIBUTION CENTER (PDC)

FUEL PUMP RELAY

The fuel pump relay is located in the Power Distribution Center (PDC) (Fig. 23). Refer to label on PDC cover for relay location.

REMOVAL

- (1) Remove PDC cover.
- (2) Remove relay from PDC.
- (3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.
- (4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

- (1) Install relay to PDC.
- (2) Install cover to PDC.

THROTTLE BODY

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the Powertrain Control Module (PCM).

REMOVAL

- (1) Remove air cleaner tube at throttle body.
- (2) Disconnect throttle body electrical connectors at MAP sensor, IAC motor and TPS (Fig. 24) or (Fig. 25).

Fig. 24 Throttle Body and Sensor Locations—4.0L Engine

- 1 - MOUNTING BOLTS (4)
- 2 - THROTTLE BODY
- 3 - IAC MOTOR
- 4 - ELEC. CONN.
- 5 - TPS
- 6 - MAP SENSOR
- 7 - ELEC. CONN.
- 8 - IAT SENSOR
- 9 - ELEC. CONN.

(3) Remove all control cables from throttle body (lever) arm. Refer to the Accelerator Pedal and Throttle Cable section of this group for additional information.

- (4) Remove four throttle body mounting bolts.
- (5) Remove throttle body from intake manifold.
- (6) Discard old throttle body-to-intake manifold gasket.

INSTALLATION

(1) Clean mating surfaces of throttle body and intake manifold.

(2) Install new throttle body-to-intake manifold gasket.

- (3) Install throttle body to intake manifold.
- (4) Install four mounting bolts. Tighten bolts to 11 N·m (100 in. lbs.) torque.
- (5) Install control cables.
- (6) Install electrical connectors.
- (7) Install air cleaner at throttle body.

REMOVAL AND INSTALLATION (Continued)

Fig. 25 Throttle Body and Sensor Locations—2.5L Engine

- 1 - IDLE AIR CONTROL MOTOR
- 2 - IAT SENSOR
- 3 - THROTTLE BODY
- 4 - THROTTLE POSITION SENSOR
- 5 - MAP SENSOR
- 6 - IDLE AIR CONTROL PASSAGE INLET
- 7 - THROTTLE BODY MOUNTING BOLTS (4)

THROTTLE POSITION SENSOR (TPS)

The TPS is mounted to the throttle body (Fig. 24) or (Fig. 25).

REMOVAL

- (1) Remove air cleaner tube at throttle body.
- (2) Disconnect TPS electrical connector.
- (3) Remove TPS mounting screws (Fig. 26).
- (4) Remove TPS.

INSTALLATION

The throttle shaft end of the throttle body slides into a socket in the TPS (Fig. 27). The TPS must be installed so that it can be rotated a few degrees. (If the sensor will not rotate, install the sensor with the throttle shaft on the other side of the socket tangs). The TPS will be under slight tension when rotated.

- (1) Install TPS and retaining screws.
- (2) Tighten screws to 7 N·m (60 in. lbs.) torque.
- (3) Connect TPS electrical connector to TPS.
- (4) Manually operate throttle (by hand) to check for any TPS binding before starting engine.
- (5) Install air cleaner tube to throttle body.

IDLE AIR CONTROL (IAC) MOTOR

The IAC motor is located on the side of the throttle body (Fig. 24) or (Fig. 25).

Fig. 26 TPS Mounting Screws

- 1 - MOUNTING SCREWS
- 2 - TPS

Fig. 27 Throttle Position Sensor—Installation

- 1 - TANGS
- 2 - THROTTLE SHAFT
- 3 - THROTTLE BODY
- 4 - TPS

REMOVAL

- (1) Remove air cleaner tube at throttle body.
- (2) Disconnect electrical connector from IAC motor.
- (3) Remove two mounting bolts (screws) (Fig. 28).
- (4) Remove IAC motor from throttle body.

INSTALLATION

- (1) Install IAC motor to throttle body.
- (2) Install and tighten two mounting bolts (screws) to 7 N·m (60 in. lbs.) torque.
- (3) Install electrical connector.
- (4) Install air cleaner tube to throttle body.

REMOVAL AND INSTALLATION (Continued)

**Fig. 28 Mounting Bolts (Screws)—IAC Motor**

- 1 - IDLE AIR CONTROL MOTOR
2 - MOUNTING SCREWS

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

The MAP sensor is mounted to the side of the throttle body (Fig. 24) or (Fig. 25). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 29).

**Fig. 29 MAP Sensor Mounting**

- 1 - THROTTLE BODY
2 - MAP SENSOR
3 - RUBBER FITTING
4 - MOUNTING SCREWS (2)

REMOVAL

- (1) Remove air cleaner intake tube at throttle body.
- (2) Remove two MAP sensor mounting bolts (screws) (Fig. 29).

(3) While removing MAP sensor, slide the rubber L-shaped fitting (Fig. 29) from throttle body.

(4) Remove rubber L-shaped fitting from MAP sensor.

INSTALLATION

- (1) Install rubber L-shaped fitting to MAP sensor.
- (2) Position sensor to throttle body while guiding rubber fitting over throttle body vacuum nipple.
- (3) Install MAP sensor mounting bolts (screws). Tighten screws to 3 N·m (25 in. lbs.) torque.
- (4) Install air cleaner intake tube.

POWERTRAIN CONTROL MODULE (PCM)

The PCM is located in the engine compartment next to the air cleaner assembly (Fig. 30).

**Fig. 30 PCM Location**

- 1 - (3) 32-WAY CONNECTORS
2 - PCM

REMOVAL

To avoid possible voltage spike damage to the PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

- (1) Disconnect negative battery cable at battery.
- (2) Remove cover over electrical connectors. Cover snaps onto PCM.
- (3) Carefully unplug the three 32-way connectors (Fig. 31) from PCM.
- (4) Remove three PCM mounting bolts and remove PCM from vehicle.

INSTALLATION

- (1) Install PCM and mounting bolts to vehicle.
- (2) Tighten bolts to 4 N·m (35 in. lbs.).
- (3) Check pin connectors in the PCM and the three 32-way connectors for corrosion or damage. Also, the pin heights in connectors should all be same. Repair as necessary before installing connectors.

REMOVAL AND INSTALLATION (Continued)

804d8eb2

Fig. 31 PCM Mounting

- 1 – PCM
2 – L. F. FENDER
3 – PCM MOUNTING BOLTS (3)

- (4) Install three 32-way connectors.
(5) Install cover over electrical connectors. Cover snaps onto PCM.
(6) Install battery cable.
(7) Use the DRB scan tool to reprogram new PCM with vehicle's original Identification Number (VIN) and original vehicle mileage.

POWER STEERING PRESSURE SWITCH—2.5L ENGINE

This switch is not used with 4.0L six-cylinder engines.

The power steering pressure switch is installed in the power steering high-pressure hose (Fig. 32).

REMOVAL

- (1) Disconnect electrical connector from power steering pressure switch.
(2) Place a small container or shop towel beneath switch to collect any excess fluid.
(3) Remove switch. Use back-up wrench on power steering line to prevent line bending.

INSTALLATION

- (1) Install power steering switch into power steering line.
(2) Tighten to 14–22 N·m (124–195 in. lbs.) torque.
(3) Connect electrical connector to switch.
(4) Check power steering fluid and add as necessary.

80a871b4

Fig. 32 Power Steering Pressure Switch

- 1 – POWER STEERING PRESSURE SWITCH
2 – ELECTRICAL CONNECTOR
3 – POWER STEERING PUMP

- (5) Start engine and again check power steering fluid. Add fluid if necessary.

OXYGEN SENSOR**REMOVAL**

Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness. For sensor operation, it must have a comparison source of oxygen from outside the exhaust system. This fresh air is supplied to the sensor through its pigtail wiring harness.

Refer to (Fig. 33), (Fig. 34), (Fig. 35) or (Fig. 36) for O2S (oxygen sensor) location.

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

- (1) Raise and support vehicle.
(2) Disconnect wire connector from O2S sensor.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

- (3) Remove O2S sensor with an oxygen sensor removal and installation tool.
(4) Clean threads in exhaust pipe using appropriate tap.

REMOVAL AND INSTALLATION (Continued)

- 4 - 1/2 O2S

80be46f4

Fig. 36 Rear Oxygen Sensor—2.5L/4.0L—Federal Emissions

1 - 1/2 O2S

INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT** add any additional anti-seize compound to threads of a new oxygen sensor.

REMOVAL AND INSTALLATION (Continued)

- (1) Install O2S sensor. Tighten to 30 N·m (22 ft. lbs.) torque.
- (2) Connect O2S sensor wire connector.
- (3) Lower vehicle.

AIR CLEANER ELEMENT (FILTER)

REMOVAL

- (1) Unlock air tube clamp (Fig. 37) at air cleaner cover. To unlock clamp, attach adjustable pliers as shown in (Fig. 38).
- (2) Remove air tube at cover.
- (3) Pry back three clips retaining air cleaner cover to air cleaner housing.
- (4) Remove housing cover and remove air cleaner element.
- (5) Clean inside of housing before replacing element.

Fig. 37 Air Cleaner Housing and Element (Filter)

- 1 - COVER
- 2 - AIR TUBE
- 3 - CLAMPS (2)
- 4 - HOUSING
- 5 - CLIPS (3)
- 6 - ELEMENT (FILTER)

INSTALLATION

- (1) Install air cleaner element into housing.
- (2) Install air cleaner cover to housing (three clips). Be sure cover is properly seated to air cleaner housing.
- (3) Install air tube and clamp to cover. Compress clamp snugly with adjustable pliers as shown in (Fig. 39).

ENGINE COOLANT TEMPERATURE SENSOR

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR. REFER TO GROUP 7, COOLING.

The coolant temperature sensor is installed in the thermostat housing (Fig. 40).

REMOVAL

- (1) Partially drain cooling system until coolant level is below cylinder head. Observe the **WARNINGS** in Group 7, Cooling.

REMOVAL AND INSTALLATION (Continued)

Fig. 40 Engine Coolant Temperature Sensor—Typical

- 1 - THERMOSTAT
- 2 - ENGINE COOLANT TEMPERATURE SENSOR
- 3 - ELECTRICAL CONNECTOR

(2) Disconnect coolant temperature sensor wire connector.

(3) Remove sensor from thermostat housing.

INSTALLATION

(1) Apply sealant to sensor threads (new replacement sensors will have sealant already applied).

(2) Install coolant temperature sensor into thermostat housing. Tighten to 11 N·m (8 ft. lbs.) torque.

(3) Connect wire connector.

(4) Fill cooling system. Refer to Group 7, Cooling System.

INTAKE MANIFOLD AIR TEMPERATURE SENSOR

The intake manifold air temperature (IAT) sensor is installed into intake manifold plenum near throttle body (Fig. 41) or (Fig. 42).

REMOVAL

(1) Disconnect electrical connector from IAT sensor.

(2) Remove sensor from intake manifold.

INSTALLATION

(1) Install IAT sensor into intake manifold. Tighten sensor to 28 N·m (20 ft. lbs.) torque.

(2) Connect electrical connector to sensor.

REMOVAL AND INSTALLATION (Continued)

VEHICLE SPEED SENSOR

The Vehicle Speed Sensor (VSS) is located on the speedometer pinion gear adapter. If equipped with 4WD, this adapter is located on the transfer case extension (left side) (Fig. 43). If equipped with 2WD, this adapter is located on the extension housing of the transmission (left side).

Fig. 43 VSS Location—4WD Shown

- 1 - SENSOR ELECTRICAL CONNECTOR
- 2 - SLIDE TAB
- 3 - 4WD TRANSFER CASE EXTENSION
- 4 - VEHICLE SPEED SENSOR
- 5 - RELEASE LOCK

REMOVAL

- (1) Raise and support vehicle.
- (2) Disconnect electrical connector from sensor by pushing slide tab (Fig. 43). After slide tab has been positioned, push in on secondary release lock (Fig. 43) on side of connector and pull connector from sensor.
- (3) Remove sensor mounting bolt (Fig. 44).
- (4) Remove sensor (pull straight out) from speedometer pinion gear adapter (Fig. 44). Do not remove gear adapter from transmission.

INSTALLATION

- (1) Clean inside of speedometer pinion gear adapter before installing speed sensor.
- (2) Install sensor into speedometer gear adapter and install mounting bolt. **Before tightening bolt, verify speed sensor is fully seated (mounted flush) to speedometer pinion gear adapter.**
- (3) Tighten sensor mounting bolt to 2.2 N·m (20 in. lbs.) torque.
- (4) Connect electrical connector to sensor.

DESCRIPTION AND OPERATION

INTRODUCTION

DESCRIPTION

This Fuel Delivery section will cover components not controlled by the PCM. For components con-

trolled by the PCM, refer to the Fuel Injection System—2.5L Diesel Engine section of this group.

The fuel heater relay, fuel heater and fuel gauge are not operated by the PCM. These components are controlled by the ignition (key) switch. All other fuel system electrical components necessary to operate the engine are controlled or regulated by the PCM.

DESCRIPTION AND OPERATION (Continued)

FUEL SYSTEM PRESSURE WARNING

DESCRIPTION

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 45,000 KPA (6526 PSI). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD (Fig. 1). HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

Fig. 1 Typical Fuel Pressure Test at Injection Pump

FUEL TANK

DESCRIPTION

The fuel tank and tank mounting used with the diesel powered engine is the same as used with gasoline powered models, although the fuel tank module is different.

The fuel tank contains the fuel tank module and one rollover valve. Two fuel lines are routed to the fuel tank module. One line is used for fuel supply to the fuel filter/water separator. The other is used to return excess fuel back to the fuel tank.

The fuel tank module contains the fuel gauge electrical sending unit. **An electric fuel pump is not used with the diesel engine.**

FUEL TANK MODULE

DESCRIPTION

An electric fuel pump is not attached to the fuel tank module for diesel powered engines. Fuel is drawn by the fuel injection pump.

The fuel tank module is installed in the top of the fuel tank. The fuel tank module contains the following components:

- Fuel reservoir
- Electric fuel gauge sending unit
- Fuel supply line connection
- Fuel return line connection
- Wire harness
- Fuel inlet filter (Strainer)

FUEL GAUGE SENDING UNIT

DESCRIPTION

The fuel gauge sending unit is attached to the side of the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor (track). The track is used to send an electrical signal used for fuel gauge operation.

As the fuel level increases, the float and arm move up. This decreases the sending unit resistance, causing the PCM to send a signal to the fuel gauge on the instrument panel to read full. As the fuel level decreases, the float and arm move down. This increases the sending unit resistance, causing the PCM to send a signal to the fuel gauge on the instrument panel to move toward empty.

FUEL FILTER/WATER SEPARATOR

DESCRIPTION

The fuel filter/water separator assembly is located in the engine compartment near the strut tower (Fig. 2).

The combination fuel filter/water separator protects the fuel injection pump by helping to remove water and contaminants from the fuel. Moisture collects at the bottom of the filter/separator in a plastic bowl.

The fuel filter/water separator assembly contains the fuel filter, fuel heater element, and water drain valve.

For information on the fuel heater, refer to Fuel Heater in this group.

Refer to the maintenance schedules in Group 0 in this manual for the recommended fuel filter replacement intervals.

For periodic draining of water from the bowl, refer to Fuel Filter/Water Separator Removal/Installation in this group.

DESCRIPTION AND OPERATION (Continued)

**Fig. 2 Fuel Filter/Water Separator Location****FUEL SHUTDOWN SOLENOID****DESCRIPTION**

The fuel shutdown solenoid is controlled and operated by the ECM.

The fuel shutdown (shut-off) solenoid is used to electrically shut off the diesel fuel supply to the high-pressure fuel injection pump. The solenoid is mounted to the rear of the injection pump.

The solenoid controls starting and stopping of the engine regardless of the position of the accelerator pedal. When the ignition (key) switch is OFF, the solenoid is shut off and fuel flow is not allowed to the fuel injection pump. When the key is placed in the ON or START positions, fuel supply is allowed at the injection pump.

FUEL INJECTION PUMP**DESCRIPTION**

The fuel injection pump is a mechanical distributor-type, Bosch VP36 series (Fig. 3). A gear on the end of the injection pump shaft meshes with the drive gear at the front of engine. The pump is mechanically timed to the engine. The ECM regulates the timing of the injection pump.

The injection pump contains the fuel shutdown solenoid, fuel temperature sensor, control sleeve sensor, fuel quantity actuator and the fuel timing solenoid (Fig. 3).

In the electronically controlled injection pump, the pump plunger works the same as the pump plunger in a mechanically controlled injection pump, but the

**Fig. 3 Fuel Injection Pump**

- 1 – FUEL INJECTION PUMP ASSEMBLY
- 2 – FUEL RETURN LINE
- 3 – FUEL SUPPLY LINE
- 4 – FUEL INJECTION PUMP 10-WAY CONNECTOR
- 5 – TIMING SOLENOID
- 6 – OVERFLOW VALVE

amount of fuel and the time the fuel is injected is controlled by the vehicle's ECM, instead of by a mechanical governor assembly. A solenoid controlled by the ECM is used in place of the mechanical governor assembly, and it moves a control sleeve inside the pump that regulates the amount of fuel being injected. There is no mechanical connection between the accelerator pedal and the electronically controlled injection pump. Instead, a sensor connected to the accelerator pedal sends a signal to the ECM that represents the actual position of the accelerator pedal. The ECM uses this input, along with input from other sensors to move the control sleeve to deliver the appropriate amount of fuel. This system is known as "Drive-By-Wire"

The actual time that the fuel is delivered is very important to the diesel combustion process. The ECM monitors outputs from the engine speed sensor (fly-wheel position in degrees), and the fuel injector sensor (mechanical movement within the #1 cylinder fuel injector). Outputs from the Accelerator Pedal Position sensor, engine speed sensor (engine rpm) and engine coolant temperature sensor are also used. The ECM will then compare its set values to these outputs to electrically adjust the fuel timing (amount of advance) within the injection pump. This is referred to as "Closed Loop" operation. The ECM monitors fuel timing by comparing its set value to when the injector #1 opens. If the value is greater than a preset value a fault will be set.

DESCRIPTION AND OPERATION (Continued)

Actual electric fuel timing (amount of advance) is accomplished by the fuel timing solenoid mounted to the bottom of the injection pump (Fig. 3). Fuel timing will be adjusted by the ECM, which controls the fuel timing solenoid.

An overflow valve is attached into the fuel return line at the rear of the fuel injection pump (Fig. 3). This valve serves two purposes. One is to ensure that a certain amount of residual pressure is maintained within the pump when the engine is switched off. This will prevent the fuel timing mechanism within the injection pump from returning to its zero position. The other purpose is to allow excess fuel to be returned to the fuel tank through the fuel return line. The pressure values within this valve are preset and can not be adjusted.

The fuel injection pump supplies high-pressure fuel of approximately 45,000 kPa (6526 psi) to each injector in precise metered amounts at the correct time.

For mechanical injection pump timing, refer to Fuel Injection Pump Timing in the Service Procedures section of this group.

FUEL INJECTORS

DESCRIPTION

The fuel injectors have controlled internal leakage which cools the injectors. Fuel drain tubes (Fig. 4) are used to route this fuel back to the overflow valve at the rear of the injection pump. This excess fuel is then returned to the fuel tank through the fuel return line.

80ba77fa

Fig. 4 Fuel Injectors and Drain Tubes

The injectors are connected to the fuel injection pump by the high-pressure fuel lines. A separate injector is used for each of the four cylinders. An injector containing a sensor (Fig. 5) is used on the number one cylinder injector. This injector is called instrumented injector #1 or needle movement sensor. It is used to tell the ECM when the #1 injector's internal spring-loaded valve seat has been forced open by pressurized fuel being delivered to the cylinder, which is at the end of its compression stroke. When the instrumented injector's valve seat is force

open, it sends a small voltage spike pulse to the ECM. This tells the ECM that the #1 cylinder injector is firing. It is not used with the other three injectors.

80ba7975

Fig. 5 Fuel Injector Sensor

- 1 - NEEDLE MOVEMENT SENSOR
- 2 - FUEL INJECTOR (NUMBER 1 CYLINDER ONLY)
- 3 - COPPER WASHER
- 4 - SENSOR CONNECTOR

Fuel enters the injector at the fuel inlet (top of injector) and is routed to the needle valve bore. When fuel pressure rises to approximately 15,000–15,800 kPa (2175–2291 psi), the needle valve spring tension is overcome. The needle valve rises and fuel flows through the spray holes in the nozzle tip into the combustion chamber. The pressure required to lift the needle valve is the injector opening pressure setting. This is referred to as the “pop-off” pressure setting.

Fuel pressure in the injector circuit decreases after injection. The injector needle valve is immediately closed by the needle valve spring and fuel flow into the combustion chamber is stopped. Exhaust gases are prevented from entering the injector nozzle by the needle valve.

A copper washer (gasket) is used at the base of each injector (Fig. 5) to prevent combustion gases from escaping.

Fuel injector firing sequence is 1–3–4–2.

FUEL TUBES/LINES/HOSES AND CLAMPS—LOW-PRESSURE TYPE

DESCRIPTION

Also refer to the proceeding section on Quick-Connect Fittings.

DESCRIPTION AND OPERATION (Continued)

Inspect all hose connections such as clamps, couplings and fittings to make sure they are secure and leaks are not present. The component should be replaced immediately if there is any evidence of degradation that could result in failure.

Never attempt to repair a plastic fuel line/tube or a quick-connect fitting. Replace complete line/tube as necessary.

Avoid contact of any fuel tubes/hoses with other vehicle components that could cause abrasions or scuffing. Be sure that the fuel lines/tubes are properly routed to prevent pinching and to avoid heat sources.

The lines/tubes/hoses are of a special construction. If it is necessary to replace these lines/tubes/hoses, use only original equipment type.

The hose clamps used to secure the rubber hoses are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause fuel leaks.

Where a rubber hose is joined to a metal tube (staked), do not attempt to repair. Replace entire line/tube assembly.

Use new original equipment type hose clamps. Tighten hose clamps to 2 N·m (20 in. lbs.) torque.

QUICK-CONNECT FITTINGS—LOW PRESSURE TYPE

DESCRIPTION

Different types of quick-connect fittings are used to attach various fuel system components. These are: a single-tab type, a two-tab type or a plastic retainer ring type (Fig. 6). Refer to Quick-Connect Fittings in the Removal/Installation section for more information.

CAUTION: The interior components (o-rings, spacers) of quick-connect fitting are not serviced separately, but new pull tabs are available for some types. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

HIGH-PRESSURE FUEL LINES

DESCRIPTION

CAUTION: The high-pressure fuel lines must be held securely in place in their holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to

J9314-100

Fig. 6 Plastic Retainer Ring-Type Fitting

- 1 - FUEL TUBE

- 4 - PLASTIC RETAINER
- 5 - PUSH
- 6 - PUSH
- 7 - PUSH
- 8 - PUSH

repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

High-pressure fuel lines deliver fuel under pressure of up to approximately 45,000 kPa (6526 PSI) from the injection pump to the fuel injectors. The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

WARNING: USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

DESCRIPTION AND OPERATION (Continued)

FUEL DRAIN TUBES

DESCRIPTION

These rubber tubes are low-pressure type. Some fuel is continually being returned to the fuel injection pump. During injection, a small amount of fuel flows past the injector needle and is not injected into the combustion chamber. This cools and lubricates the injectors. This fuel flows through the fuel drain tubes (Fig. 7) and back to the tee banjo fitting, which is connected to the same line as the overflow valve. The overflow valve is calibrated to open at a preset pressure. Excess fuel not required by the pump to maintain the minimum pump cavity pressure is then returned through the overflow valve and on to the fuel tank through the fuel return line.

80ba77fa

Fig. 7 Fuel Drain Tubes

FUEL HEATER

DESCRIPTION

The fuel heater is used to prevent diesel fuel from waxing and plugging the fuel filter during cold weather operation. The fuel heater is located in the bottom plastic bowl of the fuel filter/water separator (Fig. 8).

The element inside the heater assembly is made of a Positive Temperature Coefficient (PTC) material, and has power applied to it by the fuel heater relay anytime the ignition key is in the "on" position. PTC material has a high resistance to current flow when its temperature is high, which means that it will not generate heat when the temperature is above a certain value. When the temperature is below 7°C (45° F), the resistance of the PTC element is lowered, and allows current to flow through the fuel heater element warming the fuel. When the temperature is above 29°C (85° F), the PTC element's resistance rises, and current flow through the heater element stops.

Voltage to operate the fuel heater is supplied from the ignition (key) switch and through the fuel heater relay. Refer to the following Fuel Heater Relay for additional information. **The fuel heater and fuel heater relay are not controlled by the Powertrain Control Module (PCM).**

80b6b14f

Fig. 8 Fuel Heater Temperature Sensor and Element Location

- 1 - TERMINAL 2
- 2 - FUEL HEATER
- 3 - TERMINAL 1

FUEL HEATER RELAY

DESCRIPTION

Voltage to operate the fuel heater is supplied from the ignition (key) switch through the fuel heater relay. **The PCM or ECM is not used to control this relay.**

The fuel heater relay is located in the PDC. The PDC is located next to the battery in the engine compartment. For the location of the relay within the PDC, refer to label on PDC cover.

DIAGNOSIS AND TESTING

GENERAL INFORMATION

This section of the group will cover a general diagnosis of diesel engine fuel system components.

Diagnostic Trouble Codes: Refer to On-Board Diagnostics in Group 25, Emission Control System for a list of Diagnostic Trouble Codes (DTC's) for certain fuel system components.

VISUAL INSPECTION

A visual inspection for loose, disconnected, or incorrectly routed wires and hoses should be made before attempting to diagnose or service the diesel fuel injection system. A visual check will help find these conditions. It also saves unnecessary test and diagnostic time. A thorough visual inspection of the fuel injection system includes the following checks:

DIAGNOSIS AND TESTING (Continued)

(1) Be sure that the battery connections are tight and not corroded.

(2) Be sure that the 60 way connector is fully engaged with the PCM (Fig. 9).

(3) Be sure that the 68 way connector is fully engaged with the MSA (Fig. 10)

Fig. 9 PCM Location—Typical

- 1 - PCM HARNESS CONNECTOR C1
- 2 - PCM HARNESS CONNECTOR C2
- 3 - PCM HARNESS CONNECTOR C3
- 4 - POWERTRAIN CONTROL MODULE (PCM)

(4) Verify that the electrical connections for the ASD relay are clean and free of corrosion. This relay is located in the PDC. For the location of the relay within the PDC, refer to label on PDC cover.

(5) Verify that the electrical connections for the fuel heater relay are clean and free of corrosion. This relay is located in the PDC. For the location of the relay within the PDC, refer to label on PDC cover.

(6) Be sure the electrical connectors at the ends of the glow plugs (Fig. 11) are tight and free of corrosion.

Fig. 11 Glow Plug Connector

- 1 - GLOW PLUG ELECTRICAL CONNECTOR

Fig. 10 ECM Location—LHD

- 1 - ECM HARNESS CONNECTOR C1
- 2 - ENGINE CONTROL MODULE (ECM)
- 3 - ECM HARNESS CONNECTOR C2
- 4 - ACCELERATOR PEDAL POSITION SENSOR

(7) Be sure that the electrical connections at the glow plug relay are tight and not corroded. The glow plug relay is located in the engine compartment on the left-inner fender (Fig. 12).

(8) Inspect the starter motor and starter solenoid connections for tightness and corrosion.

(9) Verify that the Fuel Injection Pump electrical connector is firmly connected. Inspect the connector for corrosion or damaged wires. The solenoid is mounted to the rear of the injection pump (Fig. 13).

(10) Verify that the fuel heater electrical connector is firmly attached to the filter bowl at the bottom of the fuel filter/water separator. Inspect the connector for corrosion or damaged wires.

(11) Verify that the electrical pigtail connector (sensor connector) (Fig. 14) for the fuel injector sensor is firmly connected to the engine wiring harness. Inspect the connector for corrosion or damaged wires. This sensor is used on the #1 cylinder injector only.

(12) Inspect for exhaust system restrictions such as pinched exhaust pipes or a collapsed or plugged muffler.

(13) Verify that the harness connector is firmly connected to the vehicle speed sensor (Fig. 15).

DIAGNOSIS AND TESTING (Continued)

(14) Verify turbocharger wastegate operation. Refer to Group 11, Exhaust System and Intake Manifold Group for information.

(15) Verify that the harness connector is firmly connected to the engine coolant temperature sensor.

The sensor is located on the side of cylinder head near the rear of fuel injection pump (Fig. 16).

(16) Check for air in the fuel system. Refer to the Air Bleed Procedure.

(17) Inspect all fuel supply and return lines for signs of leakage.

DIAGNOSIS AND TESTING (Continued)

Fig. 16 Engine Coolant Temperature Sensor Location

- 1 - PCM ENGINE COOLANT TEMPERATURE (ECT) SENSOR
- 2 - ECM ENGINE COOLANT TEMPERATURE (ECT) SENSOR
- 3 - ECM ECT SENSOR HARNESS CONNECTOR
- 4 - PCM ECT SENSOR HARNESS CONNECTOR

(18) Be sure that the ground connections are tight and free of corrosion. Refer to Group 8, Wiring for locations of ground connections.

(19) Inspect the air cleaner element (filter) for restrictions.

(20) Be sure that the turbocharger output hose is properly connected to the charge air cooler (inter-cooler) inlet tube. Verify that the charge air cooler output hose is properly connected to the cooler and the intake manifold. Refer to Group 11, Exhaust System and Intake Manifold for information.

(21) Be sure that the vacuum hoses to the vacuum pump are connected and not leaking. The vacuum pump is located in the front of engine (internal) and is driven from the crankshaft gear (Fig. 17). Disconnect the hose and check for minimum vacuum from the pump. Refer to Group 5, Brake System for specifications and procedures.

(22) Be sure that the accessory drive belt is not damaged or slipping.

(23) Verify there is a good connection at the engine speed sensor. Refer to the Fuel Injection System in this section for location of the engine speed sensor location.

(24) Verify there is a good connection at the Boost Pressure Sensor, which is a part of the air intake assembly.

AIR IN FUEL SYSTEM

Air will enter the fuel system whenever the fuel supply lines, fuel filter/water separator, fuel filter bowl, injection pump, high-pressure lines or injectors are removed or disconnected. Air will also enter the fuel system whenever the fuel tank has been run empty.

Air trapped in the fuel system can result in hard starting, a rough running engine, engine misfire, low power, excessive smoke and fuel knock. After service is performed, air must be bled from the system before starting the engine.

Inspect the fuel system from the fuel tank to the injectors for loose connections. Leaking fuel is an indicator of loose connections or defective seals. Air can also enter the fuel system between the fuel tank and the injection pump. Inspect the fuel tank and fuel lines for damage that might allow air into the system.

For air bleeding, refer to Air Bleed Procedure in the Service Procedures section of this group.

FUEL HEATER RELAY TEST

The fuel heater relay is located in the Power Distribution Center (PDC). Refer to Relays—Operation/

DIAGNOSIS AND TESTING (Continued)

Testing in Fuel Injection System section of this group for test procedures.

FUEL INJECTOR TEST

The fuel injection nozzels, located in the engine cylinder head, spray fuel under high pressure into the individual combustion chambers. Pressurized fuel, delivered by the fuel injection pump, unseats a spring-loaded needle valve inside the injector, and the fuel is atomized as it escapes through the injector opening into the engine's combustion chamber. If the fuel injector does not operate properly, the engine may misfire, or cause other driveability problems.

A leak in the injection pump-to-injector high-pressure fuel line can cause many of the same symptoms as a malfunctioning injector. Inspect for a leak in the high-pressure lines before checking for a malfunctioning fuel injector.

WARNING: THE INJECTION PUMP SUPPLIES HIGH-PRESSURE FUEL OF UP TO APPROXIMATELY 45,000 KPA (6526 PSI) TO EACH INDIVIDUAL INJECTOR THROUGH THE HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE THE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING. AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

WARNING: DO NOT BLEED AIR FROM THE FUEL SYSTEM OF A HOT ENGINE. DO NOT ALLOW FUEL TO SPRAY ONTO THE EXHAUST MANIFOLD WHEN BLEEDING AIR FROM THE FUEL SYSTEM.

To determine which fuel injector is malfunctioning, run the engine and loosen the high-pressure fuel line nut at the injector (Fig. 18). Listen for a change in engine speed. If engine speed drops, the injector was operating normally. If engine speed remains the same, the injector may be malfunctioning. After testing, tighten the line nut to 19 N·m (14 ft. lbs.) torque. Test all injectors in the same manner one at a time.

Once an injector has been found to be malfunctioning, remove it from the engine and test it. Refer to the Removal/Installation section of this group for procedures.

After the injector has been removed, install it to a bench-mount injector tester. Refer to operating instructions supplied with tester for procedures.

The opening pressure or "pop" pressure should be 15,000–15,800 kPa (2175–2291 psi). If the fuel injector needle valve is opening ("popping") too early or too late, replace the injector.

80a0c5d4

Fig. 18 Typical Inspection of Fuel Injector

- 1 – FUEL INJECTOR
- 2 – LINE FITTING
- 3 – HIGH-PRESSURE FUEL LINE
- 4 – FUEL DRAIN TUBES

FUEL INJECTOR / NEEDLE MOVEMENT SENSOR TEST

The needle movement sensor is used only on the number-1 cylinder fuel injector (Fig. 19). It is not used on the injectors for cylinders number 2, 3, or 4.

Testing the needle movement sensor requires the use of a DRB Scan tool. Refer to the Powertrain Diagnostic Procedures manual for additional information.

FUEL INJECTION PUMP TEST

The injection pump is not to be serviced or the warranty may be voided. If the injection pump requires service, the complete assembly must be replaced.

Incorrect injection pump timing (mechanical or electrical) can cause poor performance, excessive smoke and emissions and poor fuel economy.

A defective fuel injection pump, defective fuel timing solenoid or misadjusted mechanical pump timing can cause starting problems or prevent the engine from revving up. It can also cause:

- Engine surge at idle
- Rough idle (warm engine)
- Low power
- Excessive fuel consumption
- Poor performance
- Low power

DIAGNOSIS AND TESTING (Continued)

**Fig. 19 Needle Movement Sensor Location**

- 1 – NEEDLE MOVEMENT SENSOR
 2 – FUEL INJECTOR (NUMBER 1 CYLINDER ONLY)
 3 – COPPER WASHER
 4 – SENSOR CONNECTOR

- Black smoke from the exhaust
- Blue or white fog like exhaust
- Incorrect idle or maximum speed

The electronically controlled fuel pump has no mechanical governor like older mechanically controlled fuel pumps. Do not remove the top cover of the fuel pump, or the screws fastening the wiring pigtail to the side of the pump. **The warranty of the injection pump and the engine may be void if those seals have been removed or tampered with.**

FUEL SUPPLY RESTRICTIONS**LOW-PRESSURE LINES**

Restricted or Plugged supply lines or fuel filter can cause a timing fault that will cause the ECM to operate the engine in a "Limp Home" mode. See the introduction of the Fuel Injection System in this group for more information on the Limp Home mode. Fuel supply line restrictions can cause starting problems and prevent the engine from revving up. The starting problems include; low power and blue or white fog like exhaust. Test all fuel supply lines for restrictions or blockage. Flush or replace as necessary. Bleed the fuel system of air once a fuel supply line has been replaced. Refer to the Air Bleed Procedure section of this group for procedures.

HIGH-PRESSURE LINES

Restricted (kinked or bent) high-pressure lines can cause starting problems, poor engine performance and black smoke from exhaust.

Examine all high-pressure lines for any damage. Each radius on each high-pressure line must be smooth and free of any bends or kinks.

Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

FUEL SHUTDOWN SOLENOID TEST

Refer to 2000 XJ 2.5L Diesel Powertrain Diagnostic Manual for the Fuel Shutdown Solenoid test.

HIGH-PRESSURE FUEL LINE LEAK TEST

High-pressure fuel line leaks can cause starting problems and poor engine performance.

WARNING: DUE TO EXTREME FUEL PRESSURES OF UP TO 45,000 KPA (6526 PSI), USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. DO NOT GET YOUR HAND, OR ANY PART OF YOUR BODY NEAR A SUSPECTED LEAK. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

Start the engine. Move the cardboard over the high-pressure fuel lines and check for fuel spray onto the cardboard (Fig. 20). If a high-pressure line connection is leaking, bleed the system and tighten the connection. Refer to the Air Bleed Procedure in this group for procedures. Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

CAUTION: The high-pressure fuel lines must be clamped securely in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

SERVICE PROCEDURES

AIR BLEED PROCEDURES

AIR BLEEDING AT FUEL FILTER

A certain amount of air may become trapped in the fuel system when fuel system components are serviced or replaced. Bleed the system as needed after fuel system service according to the following procedures.

WARNING: DO NOT BLEED AIR FROM THE FUEL SYSTEM OF A HOT ENGINE. DO NOT ALLOW FUEL TO SPRAY ONTO THE EXHAUST MANIFOLD WHEN BLEEDING AIR FROM THE FUEL SYSTEM.

Some air enters the fuel system when the fuel filter or injection pump supply line is changed. This small amount of air is vented automatically from the injection pump through the fuel drain manifold tubes if the filter was changed according to instructions. Ensure the the fuel filter/water separator is full of fuel

It may be necessary to manually bleed the system if:

- The bowl of the fuel filter/water separator is not partially filled before installation of a new filter
- The injection pump is replaced
- High-pressure fuel line connections are loosened or lines replaced

- Initial engine start-up or start-up after an extended period of no engine operation
- Running fuel tank empty

FUEL INJECTION PUMP BLEEDING

(1) If the fuel injection pump has been replaced, air should be bled at the overflow valve before attempting to start engine.

(a) Loosen the overflow valve (Fig. 21) at the rear of the injection pump.

(b) Place a towel below the valve.

80ba77f8

Fig. 21 Overflow Valve

- 1 - FUEL INJECTION PUMP ASSEMBLY
- 2 - FUEL RETURN LINE
- 3 - FUEL SUPPLY LINE
- 4 - FUEL INJECTION PUMP 10-WAY CONNECTOR
- 5 - TIMING SOLENOID
- 6 - OVERFLOW VALVE

WARNING: WHEN CRANKING THE ENGINE TO BLEED AIR FROM THE INJECTION PUMP, THE ENGINE MAY START. PLACE THE TRANSMISSION IN NEUTRAL OR PARK AND SET PARKING BRAKE BEFORE ENGAGING THE STARTER MOTOR.

CAUTION: Do not engage the starter motor for more than 30 seconds at a time. Allow 2 minutes between cranking intervals.

(2) Crank the engine for 30 seconds at a time to allow air trapped in the injection pump to vent out the fuel injector drain tubes. Continue this procedure until the engine starts. Observe the previous WARNING and CAUTION.

(3) Tighten overflow valve.

SERVICE PROCEDURES (Continued)

HIGH-PRESSURE FUEL LINE BLEEDING

WARNING: THE INJECTION PUMP SUPPLIES HIGH-PRESSURE FUEL OF APPROXIMATELY 45,000 KPA (6,526 PSI) TO EACH INDIVIDUAL INJECTOR THROUGH THE HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE THE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING AND AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

WARNING: DO NOT BLEED AIR FROM THE FUEL SYSTEM OF A HOT ENGINE. DO NOT ALLOW FUEL TO SPRAY ONTO THE EXHAUST MANIFOLD WHEN BLEEDING AIR FROM THE FUEL SYSTEM.

Bleed air from one injector at time.

(1) Loosen the high-pressure fuel line fitting at the injector (Fig. 22).

80a0c5d4

Fig. 22 Bleeding High-Pressure Fuel Line—Typical

- 1 - FUEL INJECTOR
- 2 - LINE FITTING
- 3 - HIGH-PRESSURE FUEL LINE
- 4 - FUEL DRAIN TUBES

(2) Crank the engine until all air has been bled from the line. **Do not operate the starter motor for longer than 30 seconds. Wait 2 minutes between cranking intervals.**

(3) Start the engine and bleed one injector at a time until the engine runs smoothly.

FUEL INJECTION PUMP TIMING

Refer to the Fuel Injection Pump Removal and Installation procedure in Service Procedures later in this Group.

REMOVAL AND INSTALLATION

ACCELERATOR PEDAL

REMOVAL

80a38325

Fig. 23 Accelerator Pedal Mounting—Typical

- 1 - PEDAL POSITION SENSOR

- (1) Disconnect electrical connector.
- (2) Remove accelerator pedal mounting bracket nuts. Remove accelerator pedal assembly.

INSTALLATION

(1) Place accelerator pedal assembly over studs protruding from floor pan. Tighten mounting nuts to 5 N·m (46 in. lbs.) torque.

(2) Connect electrical connector.

(3) Before starting the engine, operate the accelerator pedal to check for any binding.

REMOVAL AND INSTALLATION (Continued)

FUEL DRAIN TUBES

The fuel drain tubes (Fig. 24) are low-pressure type.

Pull each tube from the injector for removal. Push on for installation. Clamps are not required for these tubes.

80ba77fa

Fig. 24 Fuel Injectors and Drain Tubes

FUEL FILTER/WATER SEPARATOR

The fuel filter/water separator is located in the engine compartment on the left side near the shock tower. (Fig. 25).

80ace65e

Fig. 25 Fuel Filter/Water Separator Location

The fuel filter/water separator assembly contains the fuel filter, fuel heater element, and fuel drain valve (Fig. 25).

DRAINING WATER FROM FILTER BOWL

Moisture (water) collects at the bottom of the filter/separator in a plastic bowl. Water entering the fuel injection pump can cause serious damage to the pump. **Note that the bulb will be illuminated for approximately 2 seconds each time the key is**

initially placed in the ON position. This is done for a bulb check.

WARNING: DO NOT ATTEMPT TO DRAIN WATER FROM THE FILTER/SEPARATOR WITH THE ENGINE HOT.

(1) The bottom of the filter/separator bowl is equipped with a drain valve (Fig. 25). The drain valve is equipped with a fitting. Attach a piece of rubber hose to this fitting. This hose is to be used as a drain hose.

(2) Place a drain pan under the drain hose.

(3) Open the vent valve at top of fuel filter/water separator.

(4) With the engine not running, open the drain valve by unscrewing the valve (**drain valve has right hand threads**) from the filter/separator bowl. To gain access to this fitting, the two filter-to-mounting bracket nuts (Fig. 25) may have to be loosened a few turns.

(5) Hold the drain open until clean fuel exits the drain.

(6) After draining, close drain valve.

(7) Remove rubber drain hose.

(8) Dispose of mixture in drain pan according to applicable local or federal regulations.

FUEL FILTER REMOVAL

(1) Drain all fuel and/or water from fuel filter/water separator assembly. Refer to the previous Draining Water From Filter Bowl.

(2) Unplug the electrical connectors at bottom of plastic bowl.

(3) Remove plastic bowl from bottom of fuel filter (unscrews).

(4) Remove fuel filter from bottom of filter base (unscrews).

FUEL FILTER INSTALLATION

(1) Clean bottom of fuel filter base.

(2) Apply clean diesel fuel to new fuel filter gasket.

(3) Install and tighten filter to filter base. The beveled part of the rubber gasket should be facing up towards the filter base.

(4) Clean the inside of bowl with a soap and water mixture before installation. Carefully clean any residue between the two metal probes at the top of the water-in-fuel sensor. Do not use chemical cleaners as damage to the plastic bowl may result.

(5) Install filter bowl to bottom of filter.

(6) Install the electrical connectors at bottom of bowl.

(7) Tighten the filter-to-mounting bracket nuts (Fig. 25) to 28 N·m (250 in. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

FUEL HEATER

If the fuel heater element needs replacement, the plastic filter bowl assembly must be replaced. Refer to Fuel Filter/Water Separator for information.

FUEL HEATER RELAY

The fuel heater relay is located in the PDC. For the location of the relay within the PDC (Fig. 26), refer to label on PDC cover.

Fig. 26 Power Distribution Center (PDC) Location

FUEL LEVEL SENSOR

The fuel level sensor is located on the side of the fuel pump module. (Fig. 27)

Fig. 27 Fuel Level Sensor

- 1 - FUEL GAUGE FLOAT
- 2 - FUEL GAUGE SENDING UNIT
- 3 - PIGTAIL WIRING HARNESS

REMOVAL

- (1) Remove fuel tank. Refer to Fuel Tank Removal/Installation.
- (2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation
- (3) Remove electrical wire connector at sending unit terminals.
- (4) Press on release tab (Fig. 28) to remove sending unit from pump module.

Fig. 28 Fuel Level Sensor Release Tab

- 1 - ELECTRICAL CONNECTOR
- 2 - FUEL LEVEL SENSOR
- 3 - RELEASE TAB
- 4 - FUEL RESERVOIR MODULE

FUEL INJECTION PUMP

REMOVAL

- (1) Disconnect the negative battery cable.
- (2) Thoroughly clean the area around the injection pump and fuel lines of all dirt, grease and other contaminants. **Due to the close internal tolerances of the injection pump, this step must be performed before removing pump.**
- (3) Remove the engine accessory drive belt. Refer to Group 7, Cooling System for procedures.
- (4) Remove the generator assembly.
- (5) Remove the rubber fuel return and supply hoses from the metal lines at the pump (Fig. 29).
- (6) Remove the electrical connector at engine coolant temperature sensor.
- (7) Disconnect the Fuel Injection Pump electrical connector at fuel pump. (Fig. 29).

REMOVAL AND INSTALLATION (Continued)

**Fig. 29 Fuel Injection Pump**

- 1 - FUEL INJECTION PUMP ASSEMBLY
- 2 - FUEL RETURN LINE
- 3 - FUEL SUPPLY LINE
- 4 - FUEL INJECTION PUMP 10-WAY CONNECTOR
- 5 - FUEL TIMING SOLENOID

(8) Disconnect the main engine wiring harness from the glow plugs.

(9) Disconnect the four high-pressure fuel lines from the fuel injection pump. Also disconnect fuel lines at the fuel injectors. For procedures, refer to High-Pressure Fuel Lines in this group. Place a rag beneath the fittings to catch excess fuel.

(10) Remove the plug from timing gear cover.

(11) The "Top Dead Center" (TDC) compression firing stroke for the #1 cylinder can be determined as follows:

(a) Using a socket attached to the front of the crankshaft, rotate the engine clockwise until special alignment tool VM# 1043 can be inserted through the hole in the bottom of the clutch housing, stopping the flywheel rotation. This position is TDC or 180° away from TDC. **Engine must be at TDC #1 compression firing stroke.**

(b) To verify that you are at #1 TDC Compression. Remove the oil fill cap from the cylinder head cover and the alignment tool from the clutch housing.

(c) Rotate the crankshaft one-quarter turn clockwise and counter-clockwise while observing the rocker arm through the oil fill cap hole. If the rocker arm moves you are not at #1 TDC Compression.

(d) If #1 TDC Compression was found continue, if not rotate the crankshaft one revolution until the alignment tool can be re-installed in the flywheel. You are now at TDC for the #1 cylinder compression firing stroke. Mark the damper and timing

cover for reference to TDC. Remove the alignment tool from the clutch housing.

(12) Remove access plug and plug washer at rear of pump (Fig. 30). Thread special dial indicator and adapter tool VM.1011 (Fig. 31) into this opening. Hand tighten only.

**Fig. 30 Access Plug at Rear of Pump**

- 1 - ACCESS PLUG
- 2 - WASHER

**Fig. 31 Installing Dial Indicator and Special Adapter Tools**

- 1 - DIAL INDICATOR TOOL
- 2 - ADAPTER TOOL VM1011

REMOVAL AND INSTALLATION (Continued)

(13) Slightly rotate the engine in a counter-clockwise direction until the dial gauge indicator stops moving (20°-25° before TDC).

(14) Remove injection pump drive gear nut (Fig. 32).

Fig. 32 Removing Pump Drive Gear Nut

- 1 - TIMING GEAR COVER
- 2 - INJECTION PUMP GEAR
- 3 - PUMP GEAR NUT

(15) A special 3-piece gear removal tool set VM.1003 (Fig. 33) must be used to remove the injection pump drive gear from the pump shaft.

Fig. 33 Pump Gear Tools

- 1 - DRIVE BOLT
- 2 - TIMING COVER ADAPTER
- 3 - GEAR PULLER

(a) Thread the adapter (Fig. 34) into the timing cover.

(b) Thread the gear puller into the injection pump drive gear (Fig. 34). This tool is also used to hold the gear in synchronization during pump removal.

(c) Remove the three injection pump-to-gear cover mounting nuts (Fig. 35). **CAUTION: This step must be done to prevent injection pump damage.**

(d) Install the drive bolt into the gear puller (Fig. 34). Tighten the drive bolt to press (remove) the drive gear from injection pump shaft while driving injection pump rearward from timing gear cover mounting studs.

Fig. 34 Installing Pump Drive Gear Removal Tools

- 1 - ADAPTER
- 2 - DRIVE BOLT
- 3 - GEAR PULLER

(16) Remove pump from engine. **Do not rotate engine while gear puller is installed. Engine damage will occur.**

INSTALLATION/ADJUSTING PUMP TIMING

(1) Clean the mating surfaces of injection pump and timing gear cover.

(2) Install a new injection pump-to-timing gear cover gasket.

(3) Remove the gear removing bolt (drive bolt) from gear puller. **CAUTION: Do not remove the special gear puller or timing cover adapter tools from timing cover at this time. Gear misalignment will result.**

REMOVAL AND INSTALLATION (Continued)

**Fig. 35 Injection Pump Mounting Nuts**

- 1 - MOUNTING FLANGE
- 2 - SLOTTED HOLES (3)
- 3 - PUMP MOUNTING NUTS (3)

**Fig. 36 Access Plug at Rear of Pump**

- 1 - ACCESS PLUG
- 2 - WASHER

(4) Place the key way on the pump shaft to the 11 o'clock position as viewed from the front of pump. Install the pump into the rear of timing gear cover while aligning key way on pump shaft into pump gear.

(5) Install and snug the 3 injection pump mounting nuts. This is not the final tightening sequence.

(6) Remove the special gear puller and adapter tools from timing gear cover.

(7) Install the injection pump drive gear nut. Tighten nut to 88 N·m (65 ft. lbs.) torque.

(8) Remove the access plug and plug washer at rear of pump (Fig. 36). Thread special dial indicator adapter tool VM.1011 (Fig. 37) into this opening. Hand tighten only.

(9) Attach special dial indicator tool VM.1013 into the adapter tool (Fig. 37)

(10) Using a socket attached to the front of the crankshaft, rotate the engine in a counter-clockwise direction until the dial gage indicator stops moving (20–25° before TDC).

(11) Set the dial indicator to 0mm. Be sure the tip of the dial indicator is touching the tip inside the adapter tool.

(12) Rotate the engine clockwise until special alignment tool VM# 1043 can be inserted through the hole in the bottom of the clutch housing, stopping the flywheel rotation. This position is #1Cylinder TDC Compression. **Engine must be at TDC #1 compression firing stroke.**

(13) The gauge reading should be at 0.55 mm (with new gears installed specification should be 0.59–0.60mm). If not, the pump must be rotated for adjustment:

**Fig. 37 Installing Dial Indicator and Special Adapter Tools**

- 1 - DIAL INDICATOR TOOL
- 2 - ADAPTER TOOL VM1011

(a) Loosen the three injection pump mounting nuts at the mounting flanges. These flanges are equipped with slotted holes. The slotted holes are used to rotate and position the injection pump for fuel timing. Loosen the three nuts just enough to rotate the pump.

REMOVAL AND INSTALLATION (Continued)

(b) Rotate the pump until 0.55 mm is indicated on the dial indicator gauge. If while rotating the pump the 0.55 mm specification is passed do not attempt to rotate the pump in the opposite direction. You must rotate the pump back below the 0.25 mm specification and start the procedure over from the start of the TDC procedure. This will prevent a false reading due to gear backlash.

(c) Tighten the three pump mounting nuts to 30 N·m (22 ft. lbs.) torque.

(d) Recheck the dial indicator after tightening the pump mounting nuts. Gauge should still be reading 0.55 mm.

(14) Remove dial indicator and adapter tools.

(15) Install access plug and washer to rear of injection pump.

(16) Install plug at timing gear cover.

(17) Install and connect the four high-pressure fuel lines to the fuel injection pump. Also connect fuel lines at the fuel injectors. For procedures, refer to High-Pressure Fuel Lines in this group.

(18) Install electrical connector at engine coolant temperature sensor.

(19) Connect electrical connector at fuel shutdown solenoid.

(20) Connect the main engine wiring harness to the glow plugs.

(21) Connect the fuel timing solenoid pigtail harness to the engine wiring harness.

(22) Connect the overflow valve/banjo fitting (fuel return line assembly). Replace copper gaskets before installing.

(23) Connect the rubber fuel return and supply hoses to metal lines at pump. Tighten hose clamps to 2 N·m (20 in. lbs.) torque.

(24) Install generator assembly.

(25) Install engine accessory drive belt. Refer to Group 7, Cooling System for procedures.

(26) Install negative battery cable to battery.

(27) Start the engine and bring to normal operating temperature.

(28) Check for fuel leaks.

FUEL INJECTORS

Four fuel injectors are used on each engine. Of these four, two different types are used. The fuel injector used on cylinder number one is equipped with a fuel injector sensor (Fig. 38). The other three fuel injectors are identical. **Do not place the fuel injector equipped with the fuel injector sensor into any other location except the cylinder number one position.**

REMOVAL

(1) Disconnect negative battery cable at battery.

80ba7975

Fig. 38 Fuel Injector Sensor — #1 Cylinder

- 1 - NEEDLE MOVEMENT SENSOR
- 2 - FUEL INJECTOR (NUMBER 1 CYLINDER ONLY)
- 3 - COPPER WASHER
- 4 - SENSOR CONNECTOR

(2) Thoroughly clean the area around the injector with compressed air.

(3) Remove the fuel drain hoses (tubes) at each injector (Fig. 39) being serviced. Each of these hoses is slip-fit to the fitting on injector.

80a0c5d4

Fig. 39 Fuel Injector—Typical

- 3 - HIGH-PRESSURE FUEL LINE
- 4 - FUEL DRAIN TUBES

REMOVAL AND INSTALLATION (Continued)

(4) Remove the high-pressure fuel line at injector being removed. Refer to High-Pressure Fuel Lines in this group for procedures.

(5) Remove the injector using special socket tool number VM.1012A. When removing cylinder number one injector, thread the wiring harness through the access hole on the special socket (Fig. 40).

Fig. 40 Wiring Harness Through Socket

- 1 - FUEL INJECTOR
- 2 - WIRING HARNESS (NUMBER 1 CYLINDER ONLY)
- 3 - SPECIAL SOCKET
- 4 - FUEL INJECTOR SENSOR (NUMBER 1 CYLINDER ONLY)

(6) Remove and discard the copper washer (seal) at bottom of injector (Fig. 38).

INSTALLATION

- (1) Clean the injector threads in cylinder head.
- (2) Install new copper washer (seal) to injector.
- (3) Install injector to engine. Tighten to 70 N·m (52 ft. lbs.) torque.
- (4) Install high-pressure fuel lines. Refer to High-Pressure Fuel Lines in this group for procedures.
- (5) Install fuel drain hoses (tubes) to each injector. Do not use clamps at fuel drain hoses.
- (6) Connect negative battery cable to battery.
- (7) Bleed the air from the high-pressure lines. Refer to the Air Bleed Procedure section of this group.

FUEL TANK

REMOVAL

- (1) Disconnect negative cable from battery.
- (2) Insert fuel siphon hose into fuel filler neck and push it into the tank.
- (3) Drain fuel tank dry into holding tank or a properly labeled **diesel** safety container.
- (4) Raise vehicle on hoist.
- (5) Disconnect both the fuel fill and fuel vent rubber hoses at the fuel tank.
- (6) Disconnect fuel supply and return lines from the steel supply line (Fig. 41).

The fuel reservoir module electrical connector has a retainer that locks it in place.

- (7) Slide electrical connector lock to unlock.

- 8 - FUEL VENT HOSE

(8) Push down on connector retainer (Fig. 43) and pull connector off module.

REMOVAL AND INSTALLATION (Continued)

9514-41

Fig. 43 Module Connector Retainer and Lock

- 1 - PUSH DOWN ON RETAINER
2 - CONNECTOR LOCK

(9) Use a transmission jack to support fuel tank. Remove bolts from fuel tank straps.

(10) Lower tank slightly. Carefully remove filler hose from tank.

(11) Lower the fuel tank. Remove clamp and remove fuel filler tube vent hose. Remove fuel tank from vehicle.

INSTALLATION

(1) Position fuel tank on transmission jack. Connect fuel filler tube vent hose and replace clamp.

(2) Raise tank into position and carefully work filler tube into tank. A light coating of clean engine oil on the tube end may be used to aid assembly.

(3) Feed filler vent line thorough frame rail. Careful not to cross lines.

(4) Tighten strap bolts to 9 N·m (80 in. lbs.). Remove transmission jack.

CAUTION: Ensure straps are not twisted or bent before or after tightening strap nuts.

(5) Connect module electrical connector. Place retainer in locked position.

(6) Lubricate the fuel supply and return lines with clean 30 weight engine oil, install the quick connect fuel fitting. Refer to Tube/Fitting Assembly in the Fuel Delivery section of this Group.

(7) Attach filler line to filler tube. Pull on connector to make sure of connection.

(8) Fill fuel tank, replace cap, and connect battery negative cable.

FUEL RESERVOIR MODULE**REMOVAL**

WARNING: THE FUEL RESERVOIR OF THE FUEL MODULE DOES NOT EMPTY OUT WHEN THE TANK IS DRAINED. THE FUEL IN THE RESERVOIR WILL SPILL OUT WHEN THE MODULE IS REMOVED.

(1) Disconnect negative cable from battery.

(2) Drain fuel tank dry into holding tank or a properly labeled **diesel** safety container.

(3) Raise vehicle on hoist.

(4) Use a transmission jack to support the fuel tank. Remove bolts from fuel tank straps. Lower tank slightly.

(5) Clean area around fuel reservoir module and tank to keep dirt and foreign material out of tank.

(6) Disconnect fuel lines from fuel module by depressing quick connect retainers with thumb and fore finger.

(7) Slide module electrical connector lock to unlock.

(8) Push down on connector retainer and pull connector off module.

(9) Using Special Tool 6856, remove plastic locknut counterclockwise to release pump module (Fig. 44).

8020cd9e

Fig. 44 Fuel Reservoir Module Lock Nut Removal

- 1 - SPECIAL TOOL 6856
2 - LOCKNUT

(10) Carefully remove module and o-ring from tank.

(11) Discard old o-ring.

INSTALLATION

(1) Thoroughly clean locknut threads and mating fuel tank threads. Use a soap/water solution. **Do Not use carburetor cleaner to clean threads.**

(2) Apply clean water to the o-ring seal and place on the mating fuel tank threads.

REMOVAL AND INSTALLATION (Continued)

- (3) Wipe seal area of tank clean and place a new o-ring seal in position on pump.
- (4) Position fuel reservoir module in tank with locknut.
- (5) Tighten locknut to 75 N·m (55 ft. lbs.).
- (6) Connect fuel lines.
- (7) Plug in electrical connector. Slide connector lock into position.
- (8) Raise fuel tank, install bolts into fuel tank straps and tighten.
- (9) Lower vehicle on hoist.
- (10) Connect negative cable from battery.
- (11) Fill fuel tank. Check for leaks.
- (12) Install fuel filler cap.

HIGH-PRESSURE LINES

All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

REMOVAL

- (1) Disconnect negative battery cable from battery.
- (2) Remove the necessary clamps holding the lines to the engine.
- (3) Clean the area around each fuel line connection. Disconnect each line at the top of each fuel injector (Fig. 45).
- (4) Disconnect each high-pressure line fitting at each fuel injection pump delivery valve.
- (5) Very carefully remove each line from the engine. Note the position (firing order) of each line while removing. **Do not bend the line while removing.**

CAUTION: Be sure that the high-pressure fuel lines are installed in the same order that they were removed. Prevent the injection pump delivery valve holders from turning when removing or installing high-pressure lines from injection pump.

INSTALLATION

- (1) Carefully position each high-pressure fuel line to the fuel injector and fuel injection pump delivery valve holder in the correct firing order. Also position each line in the correct line holder.
- (2) Loosely install the line clamp/holder bolts.
- (3) Tighten each line at the delivery valve to 19 N·m (168 in. lbs.) torque.

Fig. 45 Fuel Lines at Fuel Injectors

80a0c5d4

- 1 - FUEL INJECTOR
- 2 - LINE FITTING
- 3 - HIGH-PRESSURE FUEL LINE
- 4 - FUEL DRAIN TUBES

- (4) Tighten each line at the fuel injector to 19 N·m (168 in. lbs.) torque.

Be sure the lines are not contacting each other or any other component.

- (5) Bleed air from the fuel system. Refer to the Air Bleed Procedure section of this group.

SPECIFICATIONS

FUEL TANK CAPACITY

75 Liters (20.0 Gals.)

Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerances, ambient temperatures and refill procedures.

IDLE SPEED

750 RPM \pm 25 RPM with engine at normal operating temperature.

FUEL INJECTOR FIRING SEQUENCE

1-3-4-2

FUEL SYSTEM PRESSURE

Peak Injection Pressure/Fuel Injection Pump Operating Pressure: 40,000–45,000 kPa (5801–6526 psi).

Opening Pressure of Fuel Injector: 16,500–17,300 kPa (2393–2509 psi).

DESCRIPTION AND OPERATION

FUEL INJECTION SYSTEM

DESCRIPTION

This section will cover components either regulated or controlled by the ECM controller and the Powertrain Control Module (PCM). The fuel heater relay and fuel heater are not operated by the ECM controller or the PCM. These components are controlled by the ignition (key) switch. All other fuel system electrical components necessary to operate the engine are controlled or regulated by the ECM controller, which interfaces with the PCM. Refer to the following description for more information.

Certain fuel system component failures may cause a no start, or prevent the engine from running. It is important to know that the ECM has a feature where, if possible, it will ignore the failed sensor, set a code related to the sensor, and operate the engine in a "Limp Home" mode. When the ECM is operating in a "Limp Home" mode, the Check Engine Lamp on the instrument panel may be constantly illuminated, and the engine will most likely have a noticeable loss of performance. An example of this would be an Accelerator Pedal Position Sensor failure, and in that situation, the engine would run at a constant 1100 RPM, regardless of the actual position of the pedal. This is the most extreme of the three "Limp Home" modes.

When the Check Engine Lamp is illuminated constantly with the key on and the engine running, it

DESCRIPTION AND OPERATION (Continued)

usually indicates a problem has been detected somewhere within the fuel system. The DRBIII scan tool is the best method for communicating with the ECM and PCM to diagnose faults within the system.

POWERTRAIN CONTROL MODULE (PCM)

DESCRIPTION

On LHD vehicles, the ECM is mounted behind the lower Instrument Panel to the right of the accelerator pedal (Fig. 1). On RHD vehicles, the ECM is mounted behind the lower Instrument Panel to the left of the clutch pedal. The Powertrain Control Module (PCM) is mounted in the engine compartment (Fig. 2).

Fig. 1 ECM Location—LHD

- 1 – ECM HARNESS CONNECTOR C1
- 2 – ENGINE CONTROL MODULE (ECM)
- 3 – ECM HARNESS CONNECTOR C2
- 4 – ACCELERATOR PEDAL POSITION SENSOR

The ECM Controller is a pre-programmed, digital computer. It will either directly operate or partially regulate the:

- Speed Control
- Speed Control lamp
- Fuel Timing Solenoid
- Check Engine Light
- Glow Plug Relay
- Glow Plugs
- Glow Plug Lamp
- ASD Relay
- Air Conditioning
- Tachometer
- Electric Vacuum Modulator (EVM)

The ECM can adapt its programming to meet changing operating conditions.

Fig. 2 PCM Location—LHD

- 1 – PCM HARNESS CONNECTOR C1
- 2 – PCM HARNESS CONNECTOR C2
- 3 – PCM HARNESS CONNECTOR C3
- 4 – POWERTRAIN CONTROL MODULE (PCM)

The ECM receives input signals from various switches and sensors. Based on these inputs, the ECM regulates various engine and vehicle operations through different system components. These components are referred to as **ECM Outputs**. The sensors and switches that provide inputs to the ECM are considered **ECM Inputs**.

ECM Inputs are:

- Air Conditioning Selection
- Theft Alarm
- ASD Relay
- Control Sleeve Position Sensor
- Fuel Temperature Sensor
- Mass Air Flow Sensor
- Accelerator Pedal Position Sensor
- Engine Coolant Temperature Sensor
- Low Idle Position Switch
- 5 Volt Supply
- Vehicle Speed Sensor
- Engine Speed/Crank Position Sensor (rpm)
- Needle Movement Sensor
- Starter Signal
- Brake Switch
- Speed Control Switch
- Power Ground
- Ignition (key) Switch Sense

ECM Outputs:

After inputs are received by the ECM and PCM, certain sensors, switches and components are controlled or regulated by the ECM and PCM. These are considered **ECM Outputs**. These outputs are for:

- A/C Clutch Relay (for A/C clutch operation)

DESCRIPTION AND OPERATION (Continued)

- Speed Control Lamp
- ASD Relay
- 5 Volts Supply
- Fuel Quantity Actuator
- Fuel Timing Solenoid
- Fuel Shutdown Solenoid
- Glow Plug Lamp
- Check Engine Lamp (“On/Off” signal)
- Electric Vacuum Modulator (EVM)
- Glow Plug Relay
- Tachometer

The PCM sends and receives signals to and from the ECM controller. **PCM inputs are:**

- Power Ground
- 5 Volts Supply
- Vehicle Speed Sensor
- Water-In-Fuel Sensor
- Coolant Temperature Sensor
- Low Coolant Sensor
- Sensor Return
- Fuel Level Sensor
- Oil Pressure Sensor
- Tachometer Signal
- Glow Plug Lamp
- Check Engine Lamp (“On/Off” signal)
- Brake On/Off Switch
- Battery Voltage
- ASD Relay

PCM Outputs:

- A/C On Signal
- Vehicle Theft Alarm “Ok to Run” signal
- Body Control Module CCD Bus (+)
- Body Control Module CCD Bus (-)
- Scan Tool Data Link Receive
- Scan Tool Data Link Transmit
- Low Coolant Lamp
- Generator Control

duced by the Intake Air Temperature Sensor changes inversely to the temperature, and is measured by the PCM. As a general rule, when the temperature of the air in the intake is high, the voltage signal produced by the Intake Air Temperature Sensor is low. The component of the Boost Pressure Sensor that measures manifold vacuum and turbo boost produces a voltage signal that is proportional to the pressure in the intake manifold. When the intake manifold pressure is low, the voltage is low, and when the pressure is high, the voltage is high. The PCM uses the voltage signals from the Boost Pressure Sensor, and the Intake Air Temperature Sensor to determine the amount of air flowing through the intake manifold.

Fig. 3 Boost Pressure Sensor Location

- 1 – BOOST PRESSURE SENSOR HARNESS CONNECTOR
2 – BOOST PRESSURE SENSOR

BOOST PRESSURE SENSOR

DESCRIPTION

The Boost Pressure Sensor is mounted to the top of the intake manifold (Fig. 3). It is a sensor that measures both manifold vacuum and turbo boost, and it also contains an integrated intake air temperature sensor. The Boost Pressure Sensor takes the place of the Mass Air Flow (MAF). In the Intake Air Temperature Sensor component, there is a ceramic element that changes its resistance based on temperature. The ceramic element is part of an electronic circuit connected to the PCM, and has a voltage applied to it. The ceramic element is exposed to the air inside the intake. This air has a cooling effect on the ceramic element, and its resistance changes. This causes the voltage flowing through the intake air temperature circuit to vary. The voltage signal pro-

VEHICLE THEFT ALARM

DESCRIPTION

The PCM can learn if the vehicle has a Vehicle Theft Alarm (VTA) system. Once it detects the vehicle having VTA, **the controller can ONLY BE USED ON VEHICLES WITH VTA.**

If the PCM is put on a vehicle without VTA the Glow Plug Lamp will start to blink and the vehicle will not start.

The PCM cannot be flashed to remove the VTA.

BATTERY VOLTAGE—PCM INPUT

DESCRIPTION

The battery voltage input provides power to the PCM. It also informs the PCM what voltage level is being supplied by the generator once the vehicle is running.

DESCRIPTION AND OPERATION (Continued)

The battery input also provides the voltage that is needed to keep the PCM memory alive. The memory stores Diagnostic Trouble Code (DTC) messages. Trouble codes will still be stored even if the battery voltage is lost.

SENSOR RETURN—ECM/PCM INPUT (ANALOG GROUND)**DESCRIPTION**

Sensor Return provides a low noise Analog ground reference for all system sensors.

IGNITION CIRCUIT SENSE—ECM/PCM INPUT**DESCRIPTION**

The ignition circuit sense input signals the ECM and PCM that the ignition (key) switch has been turned to the ON position. This signal initiates the glow plug control routine to begin the “pre-heat” cycle.

IGNITION CIRCUIT SENSE—PCM INPUT

The ignition circuit sense input signals the PCM that the ignition (key) switch has been turned to the ON position. This signal initiates the glow plug control routine to begin the “pre-heat” cycle.

POWER GROUND**DESCRIPTION**

Provides a common ground for power devices (solenoid and relay devices).

NEEDLE MOVEMENT OR INSTRUMENTED FIRST INJECTOR—ECM INPUT**DESCRIPTION**

This input from the ECM supplies a constant 30 mA electrical current source for the first injector sensor. It will vary the voltage to this sensor when it senses a mechanical movement within the injector needle (pintle) of the number-1 cylinder fuel injector. When this voltage has been determined by the ECM, it will then control an output to the fuel timing solenoid (the fuel timing solenoid is located on the fuel injection pump). Also refer to Fuel Injection Pump for additional information.

The first injector sensor is a magnetic (inductive) type.

The first injector sensor is used only on the fuel injector for the number-1 cylinder (Fig. 4). It is not used on the injectors for cylinders number 2, 3, or 4.

FUEL INJECTOR SENSOR—GROUND

80ba7975

Fig. 4 Fuel Injector Sensor

- 1 – NEEDLE MOVEMENT SENSOR
- 2 – FUEL INJECTOR (NUMBER 1 CYLINDER ONLY)
- 3 – COPPER WASHER
- 4 – SENSOR CONNECTOR

DESCRIPTION

Provides a low noise ground for the fuel injector sensor only.

ENGINE COOLANT TEMPERATURE SENSOR—ECM/PCM INPUT**DESCRIPTION**

The 0–5 volt input from this sensor tells the ECM and PCM the temperature of the engine coolant. Based on the voltage received at the ECM, it will then determine operation of the fuel timing solenoid, glow plug relay, electrical vacuum modulator (emission component) and generator (charging system).

The sensor is located on the side of the #3 cylinder head near the rear of fuel injection pump (Fig. 5).

ENGINE SPEED SENSOR—ECM INPUT**DESCRIPTION**

The engine speed sensor is mounted to the transmission bellhousing at the left/rear side of the engine block (Fig. 6).

The engine speed sensor produces its own output signal. If this signal is not received, the ECM will not allow the engine to start.

The engine speed sensor input is used in conjunction with the first injector sensor to establish fuel injection pump timing.

DESCRIPTION AND OPERATION (Continued)

**Fig. 5 Engine Coolant Temperature Sensor Location**

**Fig. 6 Engine Speed Sensor Location**

- 1 – ENGINE SPEED SENSOR
- 2 – GROMMET
- 3 – MOUNTING BOLT(S)
- 4 – LEFT REAR OF ENGINE
- 5 – TRANSMISSION

The flywheel has four notches at its outer edge (Fig. 7). Each notch is spaced equally every 90°. The notches cause a pulse to be generated when they pass under the speed sensor (Fig. 7). These pulses are the input to the ECM. The input from this sensor determines crankshaft position (in degrees) by monitoring the notches.

The sensor also generates an rpm signal to the ECM. This signal is used as an input for the control

**Fig. 7 Speed Sensor Operation**

- 1 – ENGINE SPEED SENSOR
- 2 – FLYWHEEL
- 3 – NOTCHES

of the generator field, vehicle speed control, and instrument panel mounted tachometer.

If the engine speed sensor should fail, the system is unable to compensate for the problem and the car will stop.

AIR CONDITIONING (A/C) CONTROLS—ECM INPUTS

DESCRIPTION

The A/C control system information applies to factory installed air conditioning units.

A/C REQUEST SIGNAL: When either the A/C or Defrost mode has been selected and the A/C low and high-pressure switches are closed, an input signal is sent to the ECM. The ECM uses this input to cycle the A/C compressor through the A/C relay.

If the A/C low or high-pressure switch opens, the ECM will not receive an A/C request signal. The PCM will then remove the ground from the A/C relay. This will deactivate the A/C compressor clutch. Also, if the engine coolant reaches a temperature outside normal of its normal range, or it overheats, the ECM will deactivate the A/C clutch.

DESCRIPTION AND OPERATION (Continued)

BRAKE SWITCH—ECM INPUT

DESCRIPTION

When the brake light switch is activated, the ECM receives an input indicating that the brakes are being applied. After receiving this input, the ECM is used to control the speed control system. There is a Primary and a Secondary brake switch. The Secondary brake switch is closed until the brake pedal is pressed.

DATA LINK CONNECTOR—PCM AND ECM INPUT AND OUTPUT

The 16-way data link connector (diagnostic scan tool connector) links the Diagnostic Readout Box (DRB) scan tool with the PCM and ECM. The data link connector is located under the instrument panel near the left body side cowl panel on left hand drive vehicles (Fig. 8). And near the right body side cowl panel on right hand drive vehicles (Fig. 9).

1 – DATA LINK CONNECTOR

80b6b22c

Fig. 10 Vehicle Speed Sensor—4 Wheel Drive

- 1 – 4WD TRANSFER CASE EXTENSION
- 2 – VEHICLE SPEED SENSOR
- 3 – SENSOR ELECTRICAL CONNECTOR

VEHICLE SPEED SENSOR—ECM INPUT

The vehicle speed sensor is located in the transfer case extension housing (Fig. 10). The sensor input is used by the ECM to determine vehicle speed and distance traveled.

The speed sensor generates 8 pulses per sensor revolution. These signals, in conjunction with a closed throttle signal from the accelerator pedal position sensor, indicate an idle deceleration to the ECM. When the vehicle is stopped at idle, a released pedal signal is received by the ECM (but a speed sensor signal is not received).

In addition to determining distance and vehicle speed, the output from the sensor is used to control speed control operation.

SPEED CONTROL—ECM INPUT

DESCRIPTION

The speed control system provides five separate inputs to the ECM: On/Off, Set, Resume/Accel, Cancel, and Decel.. The On/Off input informs the ECM that the speed control system has been activated. The Set input

DESCRIPTION AND OPERATION (Continued)

informs the ECM that a fixed vehicle speed has been selected. The Resume input indicates to the ECM that the previous fixed speed is requested.

Speed control operation will start at 50 km/h–142 km/h (35–85 mph). The upper range of operation is not restricted by vehicle speed. Inputs that effect speed control operation are vehicle speed sensor and accelerator pedal position sensor.

Refer to Group 8H for further speed control information.

ASD RELAY—ECM INPUT**DESCRIPTION**

A 12 volt signal at this input indicates to the ECM that the ASD relay has been activated. The ASD relay is located in the PDC. The PDC is located next to the battery in the engine compartment. For the location of the relay within the PDC, refer to label on PDC cover.

This input is used only to sense that the ASD relay is energized. If the ECM does not see 12 volts (+) at this input when the ASD relay should be activated, it will set a Diagnostic Trouble Code (DTC).

FIVE VOLT POWER—ECM/PCM OUTPUT**DESCRIPTION**

This circuit supplies approximately 5 volts to power the Accelerator Pedal Position Sensor, and the Boost Pressure Sensor.

ENGINE COOLANT GAUGE—PCM OUTPUT**DESCRIPTION**

Refer to the Instrument Panel and Gauges group for additional information.

ENGINE OIL PRESSURE GAUGE—PCM OUTPUT**DESCRIPTION**

Refer to the Instrument Panel and Gauges group for additional information.

GLOW PLUG LAMP—PCM OUTPUT**DESCRIPTION**

The Glow Plug lamp (malfunction indicator lamp) illuminates on the message center each time the ignition (key) switch is turned on. It will stay on for about two seconds as a bulb test.

Fig. 11 Glow Plug Lamp Symbol

SPEED CONTROL—PCM OUTPUTS**DESCRIPTION**

These two circuits control the fuel quantity actuator to regulate vehicle speed. Refer to Group 8H for Speed Control information.

AIR CONDITIONING RELAY—ECM OUTPUT**DESCRIPTION**

This circuit controls a ground signal for operation of the A/C clutch relay. Also refer to Air Conditioning (A/C) Controls—ECM Input for additional information.

The A/C relay is located in the Power Distribution Center (PDC). The PDC is located next to the battery in the engine compartment. For the location of the relay within the PDC, refer to label on PDC cover.

TIMING SOLENOID—ECM OUTPUT**DESCRIPTION**

The timing solenoid is located on the bottom of the fuel injection pump (Fig. 12).

80ba77f8

Fig. 12 Timing Solenoid

- 1 – FUEL INJECTION PUMP ASSEMBLY
- 2 – FUEL RETURN LINE
- 3 – FUEL SUPPLY LINE
- 4 – FUEL INJECTION PUMP 10-WAY CONNECTOR
- 5 – TIMING SOLENOID
- 6 – OVERFLOW VALVE

This 12(+) volt, pulse width modulated (duty-cycle) output controls the amount of fuel timing (advance) in the fuel injection pump. The higher the duty-cycle, the lower the advance. The lower the duty-cycle, the more advanced the fuel timing.

DESCRIPTION AND OPERATION (Continued)

The duty-cycle is determined by the ECM from inputs it receives from the fuel injector sensor and engine speed sensor.

TACHOMETER—PCM OUTPUT

DESCRIPTION

The PCM receives engine rpm values from the ECM controller, and then supplies engine rpm values to the Body Controller that then supplies the instrument cluster mounted tachometer (if equipped). Refer to Group 8E for tachometer information.

GLOW PLUG RELAY—ECM OUTPUT

DESCRIPTION

When the ignition (key) switch is placed in the ON position, a signal is sent to the ECM relating current engine coolant temperature. This signal is sent from the engine coolant temperature sensor.

After receiving this signal, the ECM will determine if, when and for how long a period the glow plug relay should be activated. This is done before, during and after the engine is started. Whenever the glow plug relay is activated, it will control the 12V+ 100 amp circuit for the operation of the four glow plugs.

Fig. 13 Glow Plug Relay Location

- 1 - MOUNTING BOLT
- 2 - GLOW PLUG RELAY
- 3 - ELECTRICAL CONNECTOR

With a cold engine, the glow plug relay and glow plugs may be activated for a maximum time of 200 seconds. Refer to the following Glow Plug Control chart for a temperature/time comparison of glow plug relay operation.

In this chart, Pre-Heat and Post-Heat times are mentioned. Pre-heat is the amount of time the glow plug relay circuit is activated when the ignition (key) switch is ON, but the engine has yet to be started. Post-heat is the amount of time the glow plug relay circuit is activated after the engine is operating. The Glow Plug lamp will not be illuminated during the post-heat cycle.

GLOW PLUG CONTROL

+40 C	4 SEC.	16 SEC.	60 SEC.
+70 C	3 SEC.	16 SEC.	20 SEC.

GLOW PLUGS

DESCRIPTION

Glow plugs are used to help start a cold or cool engine. The plug will heat up and glow to heat the combustion chamber of each cylinder. An individual plug is used for each cylinder. Each plug is threaded into the cylinder head above the fuel injector (Fig. 14).

Fig. 14 Glow Plug

- 1 - GLOW PLUG

Each plug will momentarily draw approximately 25 amps of electrical current during the initial key-on

DESCRIPTION AND OPERATION (Continued)

cycle. This is on a cold or cool engine. After heating, the current draw will drop to approximately 9–12 amps per plug.

Total momentary current draw for all four plugs is approximately 100 amps on a cold engine dropping to a total of approximately 40 amps after the plugs are heated.

Electrical operation of the glow plugs are controlled by the glow plug relay. Refer to the previous Glow Plug Relay—ECM Output for additional information.

ELECTRIC VACUUM MODULATOR (EVM)—ECM OUTPUT

DESCRIPTION

This circuit controls operation of the Electric Vacuum Modulator (EVM). The EVM controls operation of the EGR valve.

Refer to Group 25, Emission Control System for information. See Electric Vacuum Modulator.

DIAGNOSIS AND TESTING

DIESEL DIAGNOSTICS

The ECM controllers perform engine off diagnostic tests, which may be heard for about 60 seconds after turning the key off.

ASD RELAY TEST

To perform a test of the relay and its related circuitry, refer to the DRB scan tool. To test the relay only, refer to Relays—Operation/Testing in this section of the group.

Diagnostic Trouble Codes: Refer to On-Board Diagnostics in Group 25, Emission Control System for a list of Diagnostic Trouble Codes (DTC's) for certain fuel system components.

ENGINE SPEED SENSOR TEST

To perform a test of the engine speed sensor and its related circuitry, refer to the 3.1L Powertrain Diagnostic Procedures Manual.

Diagnostic Trouble Codes: Refer to On-Board Diagnostics in Group 25, Emission Control System for a list of Diagnostic Trouble Codes (DTC's) for certain fuel system components.

ENGINE COOLANT TEMPERATURE SENSOR TEST

The sensor is located on the side of cylinder head near the rear of fuel injection pump (Fig. 15).

For a list of Diagnostic Trouble Codes (DTC's) for certain fuel system components, refer to On-Board

Fig. 15 Engine Coolant Temperature Sensor Location

- 1 – PCM ENGINE COOLANT TEMPERATURE (ECT) SENSOR
- 2 – ECM ENGINE COOLANT TEMPERATURE (ECT) SENSOR
- 3 – ECM ECT SENSOR HARNESS CONNECTOR
- 4 – PCM ECT SENSOR HARNESS CONNECTOR

Diagnostics in Group 25, Emission Control System. To test the sensor only, refer to the following:

(1) Disconnect wire harness connector from coolant temperature sensor.

(2) Test the resistance of the sensor with a high input impedance (digital) volt-ohmmeter. The resistance (as measured across the sensor terminals) should be less than 1340 ohms with the engine warm. Refer to the following Sensor Resistance (OHMS) chart. Replace the sensor if it is not within the range of resistance specified in the chart.

(3) Test continuity of the wire harness. Do this between the ECM wire harness connector and the sensor connector terminal. Also test continuity of wire harness to the sensor connector terminal. Refer to Group 8W for wiring connector and circuitry information. Repair the wire harness if an open circuit is indicated.

(4) After tests are completed, connect electrical connector to sensor.

GLOW PLUG TEST

Hard starting or a rough idle after starting may be caused by one or more defective glow plugs. Before testing the glow plugs, a test of the glow plug relays should be performed. This will ensure that 12V+ is available at the plugs when starting the engine. Refer to the Glow Plug Relay Test for information.

For accurate test results, the glow plugs should be removed from the engine. The plugs must be checked

DIAGNOSIS AND TESTING (Continued)

SENSOR RESISTANCE (OHMS)

120	248	370	410

when cold. **Do not check the plugs if the engine has recently been operated. If plugs are checked when warm, incorrect amp gauge readings will result.**

Use Churchill Glow Plug Tester DX.900 or an equivalent (Fig. 16) for the following tests. This tester is equipped with 4 timer lamps.

(1) Remove the glow plugs from the engine. Refer to Glow Plug Removal/Installation.

(2) Attach the red lead of the tester to the 12V+ (positive) side of the battery.

(3) Attach the black lead of the tester to the 12V- (negative) side of the battery.

(4) Fit the glow plug into the top of the tester and secure it with the spring loaded bar (Fig. 16).

(5) Attach the third lead wire of the tester to the electrical terminal at the end of the glow plug.

(6) When performing the test, the tester button (Fig. 16) should be held continuously without release for 20 seconds as indicated by the 4 timer lamps. Each illuminated lamp represents a 5 second time lapse.

(a) Press and hold the tester button (Fig. 16) and note the amp gauge reading. The gauge read-

Fig. 16 Typical Glow Plug Tester

- 1 - INSERT GLOW PLUG HERE
- 2 - OBSERVATION WINDOW
- 3 - SPRING LOADED BAR
- 4 - TIMER LAMPS (4)
- 5 - TEST LEADS
- 6 - TESTER BUTTON

ing should indicate a momentary, initial current draw (surge) of approximately 25 amps. After the initial surge, the amp gauge reading should begin to fall off. The glow plug tip should start to glow an orange color after 5 seconds. If the tip did not glow after 5 seconds, replace the glow plug. Before discarding the glow plug, check the position of the circuit breaker on the bottom of the plug tester. It may have to be reset. Reset if necessary.

(b) Continue to hold the tester button while observing the amp gauge and the 4 timer lamps. When all 4 lamps are illuminated, indicating a 20 second time lapse, the amp gauge reading should indicate a 9-12 amp current draw. If not, replace the glow plug. Refer to Glow Plug Removal/Installation.

(7) Check each glow plug in this manner using one 20 second cycle. If the glow plug is to be retested, it must first be allowed to cool to room temperature.

WARNING: THE GLOW PLUG WILL BECOME EXTREMELY HOT (GLOWING) DURING THESE TESTS. BURNS COULD RESULT IF IMPROPERLY HANDLED. ALLOW THE GLOW PLUG TO COOL BEFORE REMOVING FROM TESTER.

(8) Remove the glow plug from the tester.

DIAGNOSIS AND TESTING (Continued)

GLOW PLUG RELAY TEST

The glow plug relay is located in the engine compartment on the left-inner fender (Fig. 17).

Fig. 17 Glow Plug Relay Location

- 1 - MOUNTING BOLT
- 2 - GLOW PLUG RELAY
- 3 - ELECTRICAL CONNECTOR

When the ignition (key) switch is placed in the ON position, a signal is sent to the ECM relating current engine coolant temperature. This signal is sent from the engine coolant temperature sensor.

After receiving this signal, the ECM will determine if, when and for how long a period the glow plug relay should be activated. This is done before, during and after the engine is started. Whenever the glow plug relay is activated, it will control the 12V+ 100 amp circuit for the operation of the four glow plugs.

The Glow Plug lamp is tied to this circuit. Lamp operation is also controlled by the ECM.

With a cold engine, the glow plug relay and glow plugs may be activated for a maximum time of 200 seconds. Refer to the Glow Plug Control chart for a temperature/time comparison of glow plug relay operation.

In this chart, Pre-Heat and Post-Heat times are mentioned. Pre-heat is the amount of time the glow plug relay circuit is activated when the ignition (key) switch is ON, but the engine has yet to be started. Post-heat is the amount of time the glow plug relay circuit is activated after the engine is operating. The Glow Plug lamp will not be illuminated during the post-heat cycle.

TESTING:

Disconnect and isolate the electrical connectors (Fig. 18) at all four glow plugs. With the engine cool or cold, and the key in the ON position, check for

10–12 volts + at each electrical connector. 10–12 volts + should be at each connector whenever the ECM is operating in the pre-heat or post-heat cycles (refer to the following Glow Plug Control chart). **Be very careful not to allow any of the four disconnected glow plug electrical connectors to contact a metal surface. When the key is turned to the ON position, approximately 100 amps at 12 volts is supplied to these connectors.** If 10–12 volts + is not available at each connector, check continuity of wiring harness directly to the relay. If continuity is good directly to the relay, the fault is either with the relay or the relay input from the ECM. To test the relay only, refer to Relays—Operation/Testing in this section of the group. If the relay test is good, refer to the DRB scan tool.

Diagnostic Trouble Codes: Refer to On-Board Diagnostics in Group 25, Emission Control System for a list of Diagnostic Trouble Codes (DTC's) for certain fuel system components.

DIAGNOSIS AND TESTING (Continued)

RELAYS—OPERATION/TESTING

The following description of operation and tests apply only to the ASD and other relays. The terminals on the bottom of each relay are numbered (Fig. 19).

80ad08f8

Fig. 19 Glow Plug Relay Location

- 1 - MOUNTING BOLT
- 2 - GLOW PLUG RELAY
- 3 - ELECTRICAL CONNECTOR

OPERATION

- Terminal number 30 is connected to battery voltage. For both the ASD and other relays, terminal 30 is connected to battery voltage at all times.
- The ECM grounds the coil side of the relay through terminal number 85.
- Terminal number 86 supplies voltage to the coil side of the relay.
- When the PCM de-energizes the ASD and other relays, terminal number 87A connects to terminal 30. This is the Off position. In the off position, voltage is not supplied to the rest of the circuit. Terminal 87A is the center terminal on the relay.
- When the ECM energizes the ASD and other relays, terminal 87 connects to terminal 30. This is the On position. Terminal 87 supplies voltage to the rest of the circuit.

TESTING

The following procedure applies to the ASD and other relays.

- (1) Remove relay from connector before testing.
- (2) With the relay removed from the vehicle, use an ohmmeter to check the resistance between terminals 85 and 86. The resistance should be between 75 \pm 5 ohms.

(3) Connect the ohmmeter between terminals 30 and 87A. The ohmmeter should show continuity between terminals 30 and 87A.

(4) Connect the ohmmeter between terminals 87 and 30. The ohmmeter should not show continuity at this time.

(5) Connect one end of a jumper wire (16 gauge or smaller) to relay terminal 85. Connect the other end of the jumper wire to the ground side of a 12 volt power source.

(6) Connect one end of another jumper wire (16 gauge or smaller) to the power side of the 12 volt power source. **Do not attach the other end of the jumper wire to the relay at this time.**

WARNING: DO NOT ALLOW OHMMETER TO CONTACT TERMINALS 85 OR 86 DURING THIS TEST.

(7) Attach the other end of the jumper wire to relay terminal 86. This activates the relay. The ohmmeter should now show continuity between relay terminals 87 and 30. The ohmmeter should not show continuity between relay terminals 87A and 30.

(8) Disconnect jumper wires.

(9) Replace the relay if it did not pass the continuity and resistance tests. If the relay passed the tests, it operates properly. Check the remainder of the ASD and other relay circuits. Refer to group 8W, Wiring Diagrams.

BOOST / PRESSURE SENSOR

80b77066

Fig. 20 Boost Pressure Sensor Location

- 1 - BOOST PRESSURE SENSOR HARNESS CONNECTOR
- 2 - BOOST PRESSURE SENSOR

If the boost pressure sensor fails, the PCM records a DTC into memory and continues to operate the

DIAGNOSIS AND TESTING (Continued)

engine in one of the three “limp-in” modes. When the PCM is operating in this mode, a loss of power will be present, as if the turbocharger was not operating. The best method for diagnosing faults with the boost pressure sensor is with the DRB III scan tool. **Diagnostic Trouble Codes:** Refer to On-Board Diagnostics in Group 25, Emission Control System for a list of Diagnostic Trouble Codes (DTC's) for certain fuel system components.

VEHICLE SPEED SENSOR TEST

To perform a test of the sensor and its related circuitry, refer to DRB scan tool.

Diagnostic Trouble Codes: Refer to On-Board Diagnostics in Group 25, Emission Control System for a list of Diagnostic Trouble Codes (DTC's) for certain fuel system components.

DIAGNOSTIC TROUBLE CODES

For a list of Diagnostic Trouble Codes (DTC's), refer to Group 25, Emission Control System for information. See On-Board Diagnostics.

REMOVAL AND INSTALLATION

ASD RELAY

The ASD relay is located in the PDC. For the location of the relay within the PDC, refer to label on PDC cover.

A/C CLUTCH RELAY

The A/C clutch relay is located in the PDC. For the location of the relay within the PDC, refer to label on PDC cover.

ENGINE SPEED SENSOR

The engine speed sensor is mounted to the transmission bellhousing at the rear of the engine block (Fig. 21).

REMOVAL

- (1) Disconnect the harness (on the sensor) from the main electrical harness.
- (2) Remove the sensor mounting bolts.
- (3) Remove the sensor.

INSTALLATION

- (1) Install the sensor flush against the opening in the transmission housing.
- (2) Install and tighten the sensor mounting bolt to 19 N·m (14 ft. lbs.) torque.
- (3) Connect the electrical connector to the sensor.

80a0c62e

Fig. 21 Engine Speed Sensor

- 1 - ENGINE SPEED SENSOR
- 2 - GROMMET
- 3 - MOUNTING BOLT(S)
- 4 - LEFT REAR OF ENGINE
- 5 - TRANSMISSION

ENGINE COOLANT TEMPERATURE SENSOR

The sensor is located on the side of cylinder head near the rear of fuel injection pump.

REMOVAL

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR. REFER TO GROUP 7, COOLING.

- (1) Partially drain cooling system. Refer to Group 7, Cooling.
- (2) Disconnect electrical connector from sensor.
- (3) Remove sensor from cylinder head.

INSTALLATION

- (1) Install a new copper gasket to sensor.
- (2) Install sensor to cylinder head.
- (3) Tighten sensor to 18 N·m (13 ft. lbs.) torque.
- (4) Connect electrical connector to sensor.
- (5) Replace any lost engine coolant. Refer to Group 7, Cooling System.

GLOW PLUGS

The glow plugs are located above each fuel injector (Fig. 22). Four individual plugs are used.

REMOVAL

- (1) Disconnect the negative battery cable at the battery.
- (2) Clean the area around the glow plug with compressed air before removal.

REMOVAL AND INSTALLATION (Continued)

**Fig. 22 Glow Plug**

1 - GLOW PLUG

**Fig. 23 Glow Plug Electrical Connector**

1 - GLOW PLUG ELECTRICAL CONNECTOR

(3) Disconnect electrical connector (Fig. 23) at glow plug.

(4) Remove the glow plug (Fig. 22) from cylinder head.

INSTALLATION

(1) Apply high-temperature anti-seize compound to glow plug threads before installation

(2) Install the glow plug into the cylinder head. Tighten to 14 N·m (123 in. lbs.) torque.

(3) Connect battery cable to battery.

GLOW PLUG RELAY

The glow plug relay is located in the engine compartment on the left-inner fender (Fig. 24).

**Fig. 24 Glow Plug Relay Location**

- 1 - MOUNTING BOLT
- 2 - GLOW PLUG RELAY
- 3 - ELECTRICAL CONNECTOR

REMOVAL

(1) Disconnect the negative battery cable at the battery.

(2) Remove relay mounting bolt.

(3) Disconnect electrical connector at relay and remove relay.

INSTALLATION

(1) Check condition of electrical connector for damage or corrosion. Repair as necessary.

(2) Install electrical connector to relay.

(3) Install relay to inner fender.

(4) Connect battery cable to battery.

POWERTRAIN CONTROL MODULE (PCM)

The PCM is mounted to a bracket mounted to the inner side of the right fender well behind the air cleaner assembly. (Fig. 25).

REMOVAL

(1) Disconnect the negative battery cable at the battery.

(2) Loosen the 60-Way connector (Fig. 25). The electrical connector has a sliding bar which moves inward to lock or outward to unlock.

(3) Remove the electrical connector by pulling straight out.

(4) Remove PCM.

INSTALLATION

(1) After the PCM electrical connector has been separated from the PCM, inspect the pins for corro-

REMOVAL AND INSTALLATION (Continued)

Fig. 25 PCM Location

- 1 - PCM HARNESS CONNECTOR C1
- 2 - PCM HARNESS CONNECTOR C2
- 3 - PCM HARNESS CONNECTOR C3
- 4 - POWERTRAIN CONTROL MODULE (PCM)

sion, being spread apart, bent or misaligned. Also inspect the pin heights in the connector. If the pin heights are different, this would indicate a pin has separated from the connector. Repair as necessary.

(2) Engage 60-way connector into PCM. Move slide bar to lock connector.

(3) Connect negative cable to battery.

VEHICLE SPEED SENSOR

The vehicle speed sensor is located in the transfer case housing for 4 wheel drive vehicles (Fig. 26).

REMOVAL

- (1) Raise and support vehicle.
- (2) Clean the area around the sensor before removal.
- (3) Disconnect the electrical connector from the sensor (Fig. 27).
- (4) Remove the sensor mounting bolt (Fig. 27).
- (5) Pull the sensor from the speedometer pinion gear adapter for removal.

INSTALLATION

- (1) Install new sensor into speedometer gear adapter.
- (2) Tighten sensor mounting bolt. To prevent damage to sensor or speedometer adapter, be sure the sensor is mounted flush to the adapter before tightening.
- (3) Connect electrical connector to sensor.

DESCRIPTION AND OPERATION

STEERING SYSTEM

DESCRIPTION

The power steering system has a hydraulic pump. The pump is a constant flow rate and displacement, vane-type pump. The pump on the 4.0L engine has a reservoir mounted to it (Fig. 1). The 2.5L engine has a remote mounted reservoir.

The steering gear (Fig. 1) used is a recirculating ball type gear with 14:1 gear ratio. A tilt and non-tilt column provide steering input.

NOTE: Right hand drive (RHD) and left hand drive (LHD) service procedures and torque specifications for steering linkage, gear and column are the same. The power steering pump procedures are different. Refer to appropriate service procedures regarding each component in the system.

OPERATION

The steering gear acts as a rolling thread between the worm shaft and the rack piston. Power assist is provided by the hydraulic pump. When the steering wheel is turned the worm shaft turns which moves

Fig. 1 Power Steering Gear & Pump - 4.0L

- 1 - 4.0 L PUMP
- 2 - RETURN HOSE
- 3 - STEERING GEAR
- 4 - PRESSURE HOSE
- 5 - RESERVOIR

the rack piston. The rack piston movement turns the pitman shaft which is connected to the steering linkage by the pitman arm.

DIAGNOSIS AND TESTING

POWER STEERING SYSTEM DIAGNOSIS CHARTS

STEERING NOISE

There is some noise in all power steering systems. One of the most common is a hissing sound evident at a standstill parking. Or when the steering wheel is at the end of it's travel. Hiss is a high frequency noise similar to that of a water tap being closed slowly. The noise is present in all valves that have a high velocity fluid passing through an orifice. There is no relationship between this noise and steering performance.

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONAL HISS OR WHISTLE	<ol style="list-style-type: none"> 1. Steering intermediate shaft to dash panel seal. 2. Noisy valve in power steering gear. 	<ol style="list-style-type: none"> 1. Check and repair seal at dash panel. 2. Replace steering gear.
RATTLE OR CLUNK	<ol style="list-style-type: none"> 1. Gear mounting bolts loose. 2. Loose or damaged suspension components/track bar. 3. Loose or damaged steering linkage. 4. Internal gear noise. 5. OPERATION	7	POWER STEERING PUMP	10

DESCRIPTION AND OPERATION

POWER STEERING PUMP

DESCRIPTION

Hydraulic pressure for the power steering system is provided by a belt driven power steering pump (Fig. 1). The pump shaft has a pressed-on high strength plastic drive pulley that is belt driven by the crankshaft pulley. The reservoir is attached to the pump body with spring clips on the 4.0L engine. A remote pump reservoir is used on the 2.5L engine mounted to the fan shroud. The power steering pump is connected to the steering gear by the pressure and return hoses.

OPERATION

The power steering pump is a constant flow rate and displacement, vane-type pump. The pump internal parts operate submerged in fluid. The flow control orifice is part of the high pressure line fitting. The pressure relief valve inside the flow control valve limits the pump pressure.

NOTE: Power steering pumps have different pressure rates and are not interchangeable with other pumps.

POWER STEERING PRESSURE LINE

DESCRIPTION

The hose consists of two metal ends and rubber center section that contains a tuning cable.

Fig. 1 Pump With Integral Reservoir

- 1 – CAP
- 2 – FLUID RESERVOIR (TYPICAL)
- 3 – HIGH-PRESSURE FITTING
- 4 – DRIVE PULLEY
- 5 – PUMP BODY
- 6 – RESERVOIR CLIP

OPERATION

Power steering pressure line, is used to transfer high pressure power steering fluid, from the power steering pump to the power steering gear.

DESCRIPTION AND OPERATION (Continued)

POWER STEERING RETURN LINE

DESCRIPTION

Power steering return line is a hose which is clamped at the pump and the gear.

OPERATION

Power steering return line, is used to transfer low pressure power steering fluid, from the power steering gear to the power steering pump.

DIAGNOSIS AND TESTING

POWER FLOW AND PRESSURE

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Analyzer Tool Kit 6815 (Fig. 2) and Adapter Kit 6893.

Fig. 2 Power Steering Analyzer

- 1 - TUBE
- 2 - ADAPTER FITTINGS
- 3 - ANALYZER
- 4 - GAUGE HOSE

FLOW AND PRESSURE TEST

- (1) Check the power steering belt to ensure it is in good condition and adjusted properly.
- (2) Connect pressure gauge hose from the Power Steering Analyzer to Tube 6865.
- (3) Connect Adapter 6826 to Power Steering Analyzer test valve end.

(4) Disconnect high pressure hose at the pump. Use a container for dripping fluid.

(5) Connect Tube 6865 to the pump hose fitting.

(6) Connect the power steering hose from the steering gear to Adapter 6826.

(7) Open the test valve completely.

(8) Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge and to get air out of the fluid. Then shut off engine.

(9) Check fluid level, add fluid as necessary. Start engine again and let idle.

(10) Gauge should read below 862 kPa (125 psi), if above, inspect the hoses for restrictions and repair as necessary. The initial pressure reading should be in the range of 345-552 kPa (50-80 psi).

(11) Increase the engine speed to 1500 RPM and read the flow meter. The reading should be 2.4 - 2.8 GPM, if the reading is below this specification the pump should be replaced.

CAUTION: The next step involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than three seconds as the pump could be damaged.

(12) Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**

- Pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.

- Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

(13) Open the test valve, turn steering wheel extreme left and right positions against the stops. Record the highest indicated pressure at each position. Compare readings to specifications. If highest output pressures are not the same against either stop, the gear is leaking internally and must be repaired.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 3 seconds at a time because, pump damage will result.

PUMP SPECIFICATIONS

ENGINE	RELIEF PRESSURE \pm 50	FLOW RATE (GPM)
2.5L	9653 kPa (1400 psi)	1500 RPM 2.4 - 2.8 GPM
4.0L	9653 kPa (1400 psi)	

DIAGNOSIS AND TESTING (Continued)

PUMP LEAKAGE DIAGNOSIS

1. BUSHING (BEARING) WORN, SEAL WORN. REPLACE PUMP.
2. REPLACE RESERVOIR O-RING SEAL.
3. TORQUE HOSE FITTING NUT TO SPECIFICATIONS. IF LEAKAGE PERSISTS, REPLACE O-RING SEAL.
4. TORQUE FITTING TO SPECIFICATIONS. IF LEAKAGE PERSISTS, REPLACE O-RING SEAL.
5. REPLACE PUMP.
6. CHECK OIL LEVEL: IF LEAKAGE PERSISTS WITH THE LEVEL CORRECT AND CAP TIGHT, REPLACE THE CAP.

80a1c3c3

SERVICE PROCEDURES

POWER STEERING PUMP - INITIAL OPERATION

WARNING: THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

CAUTION: Use MOPAR Power Steering Fluid or equivalent. Do not use automatic transmission fluid and do not overfill.

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal ambient temperature.

- (1) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.
- (2) Start the engine and let run for a few seconds then turn engine off.
- (3) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.
- (4) Raise the front wheels off the ground.
- (5) Slowly turn the steering wheel right and left, lightly contacting the wheel stops at least 20 times.
- (6) Check the fluid level add if necessary.
- (7) Lower the vehicle, start the engine and turn the steering wheel slowly from lock to lock.

(8) Stop the engine and check the fluid level and refill as required.

(9) If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.

REMOVAL AND INSTALLATION

POWER STEERING PUMP

NOTE: The power steering pump is mounted in the same position on LHD and RHD vehicles. On 4.0L RHD vehicles the front bracket is different. The service procedures are the same.

REMOVAL

- (1) Remove serpentine drive belt, refer to Group 7 Cooling.
- (2) Remove pressure and return hoses from pump, and drain pump.
- (3) Remove 3 pump mounting bolts through pulley access holes.
- (4) Loosen the 3 pump bracket bolts (Fig. 3) and (Fig. 4).
- (5) Tilt pump downward and remove from engine.
- (6) Remove pulley from pump.

INSTALLATION

- (1) Install pulley on pump.
- (2) Install pump on engine.
- (3) Tighten pump bracket bolts to 47 N·m (35 ft. lbs.).
- (4) Install 3 pump mounting bolts and tighten to 27 N·m (20 ft. lbs.).
- (5) Install the pressure and return hoses to pump.
- (6) Install drive belt, refer to Group 7 Cooling.
- (7) Add power steering fluid and perform Power Steering Pump Initial Operation.

PUMP RESERVOIR-2.5L

REMOVAL

- (1) Remove the hoses from the bottom of the reservoir and drain the reservoir.
- (2) Remove the push-in fastener from the top of the fan shroud.
- (3) Slide reservoir up off the fan shroud.

INSTALLATION

- (1) Slide reservoir down onto fan shroud.
- (2) Install the push-in fastener in the top of fan shroud.

REMOVAL AND INSTALLATION (Continued)

2 - PUMP ASSEMBLY 2.5L

3 - PUMP ASSEMBLY 4.0L

- (3) Install the pump hoses.
- (4) Fill reservoir to proper level. Refer to Power Steering Pump Initial Operation.

DISASSEMBLY AND ASSEMBLY

PUMP PULLEY

DISASSEMBLY

- (1) Remove pump assembly.
- (2) Remove pulley from pump with Puller C-4333 or equivalent puller (Fig. 5).

ASSEMBLY

NOTE: The pulley is marked front for installation.

- (1) Replace pulley if bent, cracked, or loose.
- (2) Install pulley on pump with Installer C-4063-B or equivalent installer (Fig. 6). The pulley must be flush with the end of the shaft. Ensure the tool and pulley are aligned with the pump shaft.
- (3) Install pump assembly.

- (4) With Serpentine Belt, run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**

PUMP RESERVOIR

DISASSEMBLY

- (1) Remove power steering pump.
- (2) Clean exterior of pump.
- (3) Clamp the pump body in a soft jaw vice.
- (4) Pry up tab and slide the retaining clips off (Fig. 7).

NOTE: Use new retaining clips for installation.

- (5) Remove fluid reservoir from pump body. Remove and discard O-ring seal.

ASSEMBLY

- (1) Lubricate new O-ring Seal with Mopar Power Steering Fluid or equivalent.

PITMAN SHAFT/SEALS/BEARING	12	POWER STEERING GEAR.....	21

DESCRIPTION AND OPERATION

POWER STEERING GEAR

DESCRIPTION

The power steering gear is a recirculating ball type gear with a 14:1 ratio.

OPERATION

The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft turns the pitman shaft, which turns the steering linkage.

CAUTION: Components attached with a nut and cotter pin must be torqued to specification. Then if the slot in the nut does not line up with the cotter pin hole, tighten nut until it is aligned. Never loosen the nut to align the cotter pin hole.

DIAGNOSIS AND TESTING

POWER STEERING GEAR LEAKAGE

1. SIDE COVER LEAK - TORQUE SIDE COVER BOLTS TO SPECIFICATION. REPLACE THE SIDE COVER SEAL IF THE LEAKAGE PERSISTS.

2. ADJUSTER PLUG SEAL - REPLACE THE ADJUSTER PLUG SEALS.

3. PRESSURE LINE FITTING - TORQUE THE HOSE FITTING NUT TO SPECIFICATIONS. IF LEAKAGE PERSISTS, REPLACE THE SEAL.

4. PITMAN SHAFT SEALS - REPLACE THE SEALS.

5. TOP COVER SEAL - REPLACE THE SEAL.

REMOVAL AND INSTALLATION

STEERING GEAR

REMOVAL

- (1) Place the front wheels in the straight ahead position with the steering wheel centered.
- (2) Disconnect and cap the fluid hoses from steering gear.
- (3) Remove the column coupler shaft from the gear.
- (4) Remove pitman arm from gear.
- (5) Remove the steering gear retaining bolts and remove the gear (Fig. 1).

Fig. 1 Steering Gear Mounting (LHD)

- 1 - FRAME
- 2 - WASHER
- 3 - SCREW
- 4 - ADAPTER
- 5 - GEAR

INSTALLATION

- (1) Install steering gear (and bracket) on the frame rail and tighten bolts to 95 N·m (70 ft. lbs.).
- (2) Align the column coupler shaft to steering gear. Install a **new** pinch bolt and tighten to 49 N·m (36 ft. lbs.).
- (3) Align and install the pitman arm and tighten nut to 251 N·m (185 ft. lbs.).
- (4) Connect fluid hoses to steering gear and tighten to 28 N·m (21 ft. lbs.).
- (5) Fill power steering system to proper level.

DISASSEMBLY AND ASSEMBLY

HOUSING END PLUG

DISASSEMBLY

- (1) Unseat and remove retaining ring from groove with a punch through the hole in the end of the housing (Fig. 2).

J8919-31

Fig. 2 End Plug Retaining Ring

1 - RETAINING RING

- (2) Slowly rotate stub shaft with 12 point socket COUNTER-CLOCKWISE to force the end plug out from housing.

CAUTION: Do not turn stub shaft any further than necessary. The rack piston balls will drop out of the rack piston circuit if the stub shaft is turned too far.

- (3) Remove O-ring from the housing (Fig. 3).

ASSEMBLY

- (1) Lubricate O-ring with power steering fluid and install into the housing.
- (2) Install end plug by tapping the plug lightly with a plastic mallet into the housing.
- (3) Install retaining ring so one end of the ring covers the housing access hole (Fig. 4).

PITMAN SHAFT/SEALS/BEARING

DISASSEMBLY

- (1) Clean exposed end of pitman shaft and housing with a wire brush.
- (2) Remove preload adjuster nut (Fig. 5).

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 3 End Plug Components

- 4 - GASKET SEAL
- 5 - PITMAN SHAFT GEAR
- 6 - HOUSING ASSEMBLY

80a3543f

(6) Remove pitman shaft from the side cover.

(7) Remove dust seal from the housing with a seal pick (Fig. 6).

CAUTION: Use care not to score the housing bore when prying out seals and washer.

(8) Remove retaining ring with snap ring pliers.

(9) Remove washer from the housing.

(10) Remove oil seal from the housing with a seal pick.

(11) Remove pitman shaft bearing from housing with a bearing driver and handle (Fig. 7).

ASSEMBLY

(1) Install pitman shaft bearing into housing with a bearing driver and handle.

(2) Coat the oil seal and washer with **special grease** supplied with the new seal.

(3) Install the oil seal with a driver and handle.

(4) Install backup washer.

DISASSEMBLY AND ASSEMBLY (Continued)

- (5) Install the retainer ring with snap ring pliers.
- (6) Coat the dust seal with **special grease** supplied with the new seal.
- (7) Install dust seal with a driver and handle.
- (8) Install pitman shaft to side cover by screwing shaft in until it fully seats to side cover.

(9) Install preload adjuster nut. **Do not tighten nut until after Over-Center Rotation Torque adjustment has been made.**

(10) Install gasket to side cover and bend tabs around edges of side cover (Fig. 5).

(11) Install pitman shaft assembly and side cover to housing.

(12) Install side cover bolts and tighten to 60 N·m (44 ft. lbs.).

(13) Perform over-center rotation torque adjustment.

SPOOL VALVE**DISASSEMBLY**

(1) Remove lock nut (Fig. 8).

(2) Remove adjuster nut with Spanner Wrench C-4381.

(3) Remove thrust support assembly out of the housing (Fig. 9).

(4) Pull stub shaft and valve assembly from the housing (Fig. 10).

**Fig. 8 Lock Nut and Adjuster Nut**

- 1 - ADJUSTER NUT
- 2 - STEERING GEAR
- 3 - LOCK NUT
- 4 - PUNCH

(5) Remove stub shaft from valve assembly by lightly tapping shaft on a block of wood to loosen shaft. Then disengage stub shaft pin from hole in spool valve and separate the valve assembly from stub shaft (Fig. 11).

(6) Remove spool valve from valve body by pulling and rotating the spool valve from the valve body (Fig. 12).

(7) Remove spool valve O-ring and valve body teflon rings and O-rings underneath the teflon rings (Fig. 13).

(8) Remove the O-ring between the worm shaft and the stub shaft.

ASSEMBLY

NOTE: Clean and dry all components, then lubricate with power steering fluid.

- (1) Install spool valve spool O-ring.
- (2) Install spool valve in valve body by pushing and rotating. Hole in spool valve for stub shaft pin must be accessible from opposite end of valve body.

J9319-37

Fig. 12 Spool Valve

- 1 - SPOOL VALVE
- 2 - ROTATE VALVE TO REMOVE
- 3 - VALVE BODY

(3) Install stub shaft in valve spool and engage locating pin on stub shaft into spool valve hole (Fig. 14).

NOTE: Notch in stub shaft cap must fully engage valve body pin and seat against valve body shoulder.

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 13 Valve Seals**

(6) Install stub shaft and valve assembly in the housing. Line up worm shaft to slots in the valve assembly.

(7) Install thrust support assembly.

NOTE: The thrust support is serviced as an assembly. If any component of the thrust support is damaged the assembly must be replaced.

(8) Install adjuster nut and lock nut.

(9) Adjust Thrust Bearing Preload and Over-Center Rotating Torque.

RACK PISTON AND WORM SHAFT**DISASSEMBLY**

(1) Remove housing end plug.

(2) Remove rack piston plug (Fig. 16).

(3) Remove side cover and pitman shaft.

(4) Turn stub shaft COUNTERCLOCKWISE until the rack piston begins to come out of the housing.

(5) Insert Arbor C-4175 into bore of rack piston (Fig. 17) and hold tool tightly against worm shaft.

(6) Turn the stub shaft with a 12 point socket COUNTERCLOCKWISE, this will force the rack piston onto the tool and hold the rack piston balls in place.

(7) Remove the rack piston and tool together from housing.

(8) Remove tool from rack piston.

(9) Remove rack piston balls.

(10) Remove clamp bolts, clamp and ball guide (Fig. 18).

(11) Remove teflon ring and O-ring from the rack piston (Fig. 19).

**Fig. 14 Stub Shaft Installation**

1 - NOTCH IN CAP
2 - VALVE BODY PIN

J9319-38

(4) Install O-rings and teflon rings over the O-rings on valve body.

(5) Install O-ring into the back of the stub shaft cap (Fig. 15).

Fig. 19 Rack Piston Teflon Ring and O-Ring

- 1 - TEFLON SEAL
- 2 - BACK-UP O-RING MUST BE INSTALLED UNDER PISTON RING
- 3 - RACK PISTON NUT

(12) Remove the adjuster lock nut and adjuster nut from the stub shaft.

(13) Pull the stub shaft with the spool valve and thrust support assembly out of the housing.

(14) Remove the worm shaft from the housing (Fig. 20).

ASSEMBLY

NOTE: Clean and dry all components and lubricate with power steering fluid.

(1) Check for scores, nicks or burrs on the rack piston finished surface. Slight wear is normal on the worm gear surfaces.

DISASSEMBLY AND ASSEMBLY (Continued)

80aa4b15

Fig. 20 Worm Shaft

- 1 - GEAR HOUSING
- 2 - BEARING RACE
- 3 - WORM SHAFT
- 4 - BEARING

(2) Install O-ring and teflon ring on the rack piston.

(3) Install worm shaft in the rack piston and align worm shaft spiral groove with rack piston ball guide hole (Fig. 21).

J9319-39

Fig. 21 Installing Balls in Rack Piston

- 1 - INSTALL BALLS IN THIS HOLE WHILE SLOWLY ROTATING WORM COUNTER CLOCKWISE
- 2 - WORM FLANGE

CAUTION: The rack piston balls must be installed alternately into the rack piston and ball guide. This maintains worm shaft preload. There are 12 black balls and 12 silver (Chrome) balls. The black balls are smaller than the silver balls.

(4) Lubricate and install rack piston balls through return guide hole while turning worm shaft COUNTERCLOCKWISE (Fig. 21).

(5) Install remaining balls in guide using grease to hold the balls in place (Fig. 22).

J9319-40

Fig. 22 Balls in the Return Guide

- 1 - GUIDE
- 2 - PETROLEUM JELLY
- 3 - BALLS

(6) Install the guide onto rack piston and install clamp and clamp bolts. Tighten bolts to 4.8 N·m (43 in. lbs.).

(7) Insert Arbor C-4175 into bore of rack piston and hold tool tightly against worm shaft.

(8) Turn the worm shaft COUNTERCLOCKWISE while pushing on the arbor. This will force the rack piston onto the arbor and hold the rack piston balls in place.

(9) Install the races and thrust bearing on the worm shaft and install shaft in the housing (Fig. 20).

(10) Install the stub shaft with spool valve, thrust support assembly and adjuster nut in the housing.

(11) Install the rack piston and arbor tool into the housing.

(12) Hold arbor tightly against worm shaft and turn stub shaft CLOCKWISE until rack piston is seated on worm shaft.

(13) Install pitman shaft and side cover in the housing.

(14) Install rack piston plug and tighten to 150 N·m (111 ft. lbs.).

(15) Install housing end plug.

(16) Adjust worm shaft thrust bearing preload and over-center rotating torque.

ADJUSTMENTS

STEERING GEAR

CAUTION: Steering gear must be adjusted in the proper order. If adjustments are not performed in order, gear damage and improper steering response may result.

NOTE: Adjusting the steering gear in the vehicle is not recommended. Remove gear from the vehicle and drain the fluid. Then mount gear in a vise to perform adjustments.

WORM THRUST BEARING PRELOAD

- (1) Mount the gear carefully into a vise.

CAUTION: Do not overtighten the vise on the gear case. This may affect the adjustment

- (2) Remove adjuster plug locknut (Fig. 23).
- (3) Rotate the stub shaft back and forth with a 12 point socket to drain the remaining fluid.

Fig. 23 Adjuster Lock Nut

- 1 - ADJUSTER NUT
- 2 - STEERING GEAR
- 3 - LOCK NUT
- 4 - PUNCH

- (4) Turn the adjuster in with Spanner Wrench C-4381. Tighten the plug and thrust bearing in the housing until firmly bottomed in the housing about 34 N·m (25 ft. lbs.).

- (5) Place an index mark on the housing even with one of the holes in adjuster plug (Fig. 24).

- (6) Measure back (counterclockwise) 5.08 mm (0.20 in) and mark housing (Fig. 25).

Fig. 24 Alignment Marking On Housing

- 1 - INDEX

Fig. 25 Second Marking On Housing

- 1 - REFERENCE MARK

- (7) Rotate adjustment cap back (counterclockwise) with spanner wrench until hole is aligned with the second mark (Fig. 26).

- (8) Install and tighten locknut to 108 N·m (80 ft. lbs.). Be sure adjustment cap does not turn while tightening the locknut.

ADJUSTMENTS (Continued)

J9219-30

Fig. 26 Aligning To The Second Mark

- 1 - FIRST MARK
- 2 - SECOND MARK
- 3 - SPANNER WRENCH

OVER-CENTER

NOTE: Before performing this procedure, the worm bearing preload adjustment must be performed.

(1) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.

(2) Starting at either stop, turn the stub shaft back 1/2 the total number of turns. This is the center of the gear travel (Fig. 27).

(3) Place the torque wrench in the vertical position on the stub shaft. Rotate the wrench 45 degrees each side of the center and record the highest rotational torque in this range (Fig. 28). This is the Over-Center Rotating Torque.

NOTE: The stub shaft must rotate smoothly without sticking or binding.

(4) Rotate the stud shaft between 90° and 180° to the left of center and record the left off-center preload. Repeat this to the right of center and record the right off-center preload. The average of these two recorded readings is the Preload Rotating Torque.

(5) The Over-Center Rotating Torque should be 0.40-0.70 N·m (3-7 in. lbs.) **higher** than the Preload Rotating Torque.

(6) If an adjustment to the Over-Center Rotating Torque is necessary, first loosen the adjuster lock nut. Then turn the pitman shaft adjuster screw back

J8919-62

Fig. 27 Steering Gear Centered

- 1 - ADJUSTMENT SCREW
- 2 - MASTER SPLINE

(COUNTERCLOCKWISE) until fully extended, then turn back in (CLOCKWISE) one full turn.

80b34e43

Fig. 28 Checking Over-center Rotation Torque

- 1 - CENTER

(7) Remeasure Over-Center Rotating Torque. If necessary turn the adjuster screw and repeat mea-

ADJUSTMENTS (Continued)

surement until correct Over-Center Rotating Torque is reached.

NOTE: To increase the Over-Center Rotating Torque turn the screw **CLOCKWISE**.

(8) Prevent the adjuster screw from turning while tightening adjuster lock nut. Tighten the adjuster lock nut to 49 N·m (36 ft. lbs.).

DESCRIPTION AND OPERATION

STEERING LINKAGE

DESCRIPTION

The steering linkage consist of a pitman arm, drag link, tie rod, tie rod ends and a steering damper (Fig. 1) and (Fig. 2). The service procedures and torque

specifications are the same for LHD and RHD vehicles.

CAUTION: Components attached with a nut and cotter pin must be torqued to specification. Then if the slot in the nut does not line up with the cotter pin hole, tighten nut until it is aligned. Never loosen the nut to align the cotter pin hole.

- 4 - TIE ROD
- 5 - ADJUSTMENT SLEEVE

SERVICE PROCEDURES

STEERING LINKAGE

The tie rod end and ball stud seals should be inspected during all oil changes. If a seal is damaged, it should be replaced. Before installing a new seal, inspect ball stud at the throat opening. Check for lubricant loss, contamination, ball stud wear or corrosion. If these conditions exist, replace the tie rod. A replacement seal can be installed if lubricant is in good condition. Otherwise, a complete replacement ball stud end should be installed.

CAUTION: If any steering components are replaced or serviced an alignment must be performed, to ensure the vehicle meets all alignment specifications.

CAUTION: Components attached with a nut and cotter pin must be torqued to specification. Then if the slot in the nut does not line up with the cotter pin hole, tighten nut until it is aligned. Never loosen the nut to align the cotter pin hole.

REMOVAL AND INSTALLATION

TIE ROD

CAUTION: Use a Puller tool C-3894-A for tie rod removal. Failure to use this tool could damage the ball stud and seal (Fig. 3).

REMOVAL

- (1) Remove the cotter pins and nuts at the tie rod ball studs and drag link.
- (2) Loosen the ball studs with a puller tool to remove the tie rod.
- (3) Loosen clamp bolts and unthread the tie rod end from the tube.

INSTALLATION

- (1) Thread the tie rod end into the tube and position the clamp to it's original position (Fig. 4). Tighten the clamp bolts to 27 N·m (20 ft. lbs.).
- (2) Install the tie rod on the drag link and steering knuckle. Install the retaining nuts.
- (3) Tighten the ball stud nut on the steering knuckle to 47 N·m (35 ft. lbs.). Tighten the ball stud nut to drag link to 74 N·m (55 ft. lbs.). Install new cotter pins.

REMOVAL AND INSTALLATION (Continued)

- 2 - DRAG LINK CLAMPS

PITMAN ARM**REMOVAL**

- (1) Remove the cotter pin and nut from the drag link at the pitman arm.
- (2) Remove the drag link ball stud from the pitman arm with a puller.
- (3) Remove the nut and washer from the steering gear shaft. Mark the pitman shaft and pitman arm for installation reference. Remove the pitman arm from steering gear with Puller C-4150-A (Fig. 5).

**Fig. 5 Pitman Arm Puller**

- 1 - PITMAN ARM
- 2 - SPECIAL TOOL C-4150-A
- 3 - WRENCH

INSTALLATION

- (1) Align and install the pitman arm on steering gear shaft.
- (2) Install the washer and nut on the shaft and tighten nut to 251 N·m (185 ft. lbs.).
- (3) Install drag link ball stud to pitman arm install nut and tighten to 74 N·m (55 ft. lbs.). Install a new cotter pin.

DRAG LINK**REMOVAL**

- (1) Remove cotter pins and nuts from drag link
- (2) Remove the steering damper ball stud from the drag link.
- (3) Remove tie rod from drag link
- (4) Remove drag link from the steering knuckle and pitman arm.

INSTALLATION

- (1) Install the drag link onto steering knuckle and pitman arm.
- (2) Install nut at steering knuckle and tighten to 47 N·m (35 ft. lbs.). Install new cotter pins.
- (3) Install nut at pitman arm and tighten to 74 N·m (55 ft. lbs.). Install new cotter pins.
- (4) Install tie rod onto drag link and install nut. Tighten nut to 74 N·m (55 ft. lbs.) and install new cotter pins.

REMOVAL AND INSTALLATION (Continued)

(5) Install steering damper onto drag link and install nut. Tighten nut to 74 N·m (55 ft. lbs.) and install a new cotter pin.

STEERING DAMPER

REMOVAL

- (1) Remove the steering damper retaining bolt from the axle bracket.
- (2) Remove the cotter pin and nut from the ball stud at the drag link.
- (3) Remove the steering damper ball stud from the drag link with Puller C-3894-A.

INSTALLATION

- (1) Install steering damper onto the axle bracket and drag link.
- (2) Install steering damper bolt in axle bracket and tighten nut to 75 N·m (55 ft. lbs.).
- (3) Install ball stud nut at the drag link and tighten nut to 75 N·m (55 ft. lbs.). Install a new cotter pin.

DESCRIPTION AND OPERATION		SPECIFICATIONS	
STEERING COLUMN	26	TORQUE CHART	28
REMOVAL AND INSTALLATION			
STEERING COLUMN	26		

DESCRIPTION AND OPERATION

STEERING COLUMN

DESCRIPTION

The standard non-tilt and tilt steering column has been designed to be serviced as an assembly. The key cylinder, switches, clock spring, trim shrouds and steering wheel are serviced separately. On the non-tilt column the upper mounting bracket is also serviced separately.

The column is mounted to the column support bracket studs and secured by four nuts. The column is connected to the steering gear by a one piece collapsible shaft with a coupler at each end. The couplers secure the shaft to the steering column and steering gear.

SERVICE PRECAUTIONS

Safety goggles should be worn at all times when working on steering columns.

To service the steering wheel, switches or airbag, refer to Group 8M and follow all WARNINGS and CAUTIONS.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

REMOVAL AND INSTALLATION

STEERING COLUMN

WARNING: BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED. REFER TO GROUP 8M RESTRAINT SYSTEMS FOR SERVICE PROCEDURES. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY.

CAUTION: Keep clock spring from turning during removal and installation. Failure to do so may damage the clock spring.

REMOVAL

- (1) Position front wheels **straight ahead**.
- (2) Remove and isolate the negative battery ground cable.
- (3) Remove the airbag, refer to Group 8M Restraint Systems for service procedures.

NOTE: If equipped with cruise control, disconnect clock spring harness from cruise switch harness on the steering wheel.

- (4) Remove the steering wheel with an appropriate puller (Fig. 1).

CAUTION: Ensure the puller bolts are fully engaged into the steering wheel and not into the clock-spring, before attempting to remove the wheel. Failure to do so may damage the steering wheel.

- (5) Turn ignition cylinder to the on position and remove cylinder by pressing release through lower shroud access hole (Fig. 2).

REMOVAL AND INSTALLATION (Continued)

Fig. 4 Tilt Steering Column Mounting

- 1 - STEERING COLUMN
2 - MOUNTING NUTS
3 - COUPLER BOLT

(6) Remove knee blocker cover and knee blocker. Refer to Group 8E Instrument Panel Systems.

(7) Remove screws from the lower column shroud (Fig. 3) and remove lower shroud.

(8) Remove the steering coupler bolt and column mounting nuts (Fig. 4) then lower column off the mounting stud.

(9) Remove upper column shroud (Fig. 3).

(10) Disconnect and remove the wiring harness from the column (Fig. 5).

NOTE: If vehicle is equipped with automatic transmission, remove shifter interlock cable. Refer to Group 21 Transmission and Transfer Case for procedure.

(11) Remove column.

(12) Remove nut and bolt from the upper column mounting bracket on non-tilt column (Fig. 6). Remove the bracket from the column and **note the mounting location and orientation of the bracket.**

(13) Remove clock spring, switches, (SKIM if equipped) and ignition key cylinder, refer to Group 8 Electrical for service procedures.

INSTALLATION

(1) Install upper column mounting bracket on non-tilt column. Install the mounting bolt and tighten the nut to 17 N·m (150 in. lbs.).

(2) Install switches, refer to Group 8 Electrical for service procedures.

REMOVAL AND INSTALLATION (Continued)

**Fig. 5 Steering Column Harness**

- 1 - STEERING COLUMN
 2 - INTERLOCK CABLE
 3 - COLUMN HARNESS

**Fig. 6 Non-Tilt Column**

- 1 - NON-TILT COLUMN
 2 - UPPER BRACKET

(3) Align and install column into the steering coupler.

(4) Install column harness and connect harness to switches.

NOTE: If vehicle is equipped with automatic transmission install shifter interlock cable. Refer to Group 21 Transmission and Transfer Case for installation and adjustment.

(5) Install upper column shrouds.
 (6) Install column onto the mounting studs.
 (7) Install mounting nuts and tighten to 23 N·m (17 ft. lbs.).

(8) Install steering column coupler bolt and tighten to 49 N·m (36 ft. lbs.).

(9) Center the clock spring (if necessary) and install it on the column, refer to Group 8 Electrical for service procedures.

(10) Install lower column shroud and install mounting screws.

(11) Install ignition cylinder.

(12) Install knee blocker and knee blocker cover, Refer to Group 8E Instrument Panel Systems.

(13) Install steering wheel and tighten nut to 54 N·m (40 ft. lbs.).

NOTE: If equipped with cruise control, connect clock spring harness to cruise switch harness on the steering wheel.

(14) Install airbag, refer to Group 8M Restraint Systems for service procedures.

(15) Install negative battery terminal.

DESCRIPTION AND OPERATION

POWER STEERING PUMP

The power steering pump used with the 2.5L VM Diesel engine operates the same way as the power

steering pump used with the 2.5/4.0L gasoline engines. Refer to the Description and Operation section for the 2.5/4.0L gasoline engine power steering pump for more information.

SERVICE PROCEDURES

POWER STEERING PUMP - INITIAL OPERATION

WARNING: THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

CAUTION: Use MOPAR Power Steering Fluid or equivalent. Do not use automatic transmission fluid and do not overfill.

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal ambient temperature.

(1) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two minutes.

(2) Start the engine and let run for a few seconds then turn engine off.

(3) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.

(4) Raise the front wheels off the ground.

(5) Slowly turn the steering wheel right and left, lightly contacting the wheel stops at least 20 times.

(6) Check the fluid level add if necessary.

(7) Lower the vehicle, start the engine and turn the steering wheel slowly from lock to lock.

(8) Stop the engine and check the fluid level and refill as required.

(9) If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.

REMOVAL AND INSTALLATION

POWER STEERING PUMP — LHD

Removal

- (1) Disconnect the negative battery cable.
- (2) Remove the A/C line support bracket from the rear of the rocker cover.
- (3) Disconnect the A/C compressor electrical connector.
- (4) Remove the (2) engine mount upper sill plate nuts (Fig. 1).

80b9a4c1

Fig. 1 Engine Mount Sill Plate Nuts

- 1 – SILL PLATE NUTS
- 2 – STEERING SHAFT
- 3 – ENGINE MOUNT

(5) Make sure the steering wheel is in the unlocked position.

(6) Raise the vehicle on a hoist.

(7) Remove the steering shaft pinch bolt and slide the steering shaft straight off the gearbox input shaft, position the shaft aside.

REMOVAL AND INSTALLATION (Continued)

CAUTION: Avoid turning the steering shaft while disconnected from the steering gearbox. Damage to steering column clockspring could occur.

(8) Remove the power steering fluid supply hose from the pump and let the fluid drain.

(9) Loosen the (4) H-Block retaining bolts. Do not remove the bolts at this time.

(10) Remove the accessory drive belt from the power steering pump pulley. Refer to Group 7, Cooling System for procedure.

(11) Remove the power steering pump pulley. Use a hex socket to secure the pump shaft while removing the pulley nut with a box wrench (Fig. 2).

80b9a4c2

Fig. 2 Removing the Power Steering Pump Pulley

- 1 - LEVERAGE PIPE
- 2 - HEX WRENCH
- 3 - POWER STEERING PUMP PULLEY
- 4 - BOX WRENCH

NOTE: Mark the position of the H-Block in relation to the A/C Compressor so it may be reinstalled in the same position.

(12) Remove the (2) bolts retaining the H-Block to the power steering pump shaft coupler.

(13) Loosen the coupler pinch bolt and slide the coupler towards the pump.

(14) Remove the power steering pump pressure line from the steering gear. This is more accessible, but will require you to install the pressure line on the new pump prior to installation.

(15) Remove the remaining 2 bolts from the H-Block and remove the H-Block from the compressor.

(16) Support the A/C compressor with mechanics wire before proceeding to the next step.

(17) Remove the (4) A/C compressor retaining bolts.

(18) Remove the left engine mount throughbolt nut only. Do not remove the bolt at this time.

(19) Position a jack stand and raise weight off left engine mount.

(20) Remove the track bar support bracket retaining bolts and remove bracket (Fig. 3).

80b9a4be

Fig. 3 Engine Mount Retaining Bolts

- 1 - TRACK BAR SUPPORT BRACKET RETAINING BOLTS
- 2 - ENGINE MOUNT SILL PLATE BOLT

(21) Remove the lower engine mount bolt from the sill plate (Fig. 3).

(22) Remove the (4) engine mount bracket bolts from the engine block.

(23) Remove the engine mount throughbolt.

(24) Remove the engine mount and engine mount bracket from the vehicle.

(25) Remove the (2) power steering pump retaining nuts (Fig. 4).

(26) Remove the power steering pump from the vehicle.

Installation

WARNING: Power steering system fluid may be contaminated with metal shavings, overheated or improper fluid. All fluid should be drained from the system. After component replacement, system should be flushed and filled with Mopar Power Steering Fluid, or equivalent.

REMOVAL AND INSTALLATION (Continued)

80b9a49b

(1) Transfer the pressure line to the new pump, making sure line is in original position.

(2) Transfer the coupler to the new pump leaving pinch bolt loose at this time (Fig. 5).

(3) Install the power steering pump (Fig. 5).

(4) Install the engine mount and the engine mount bracket in the vehicle.

(5) Install the engine mount throughbolt and leave loose at this time.

(6) Install, but do not torque the engine mount and track bar support bracket bolts (Fig. 6).

(7) Install the (4) engine mount bracket to engine block retaining bolts. Torque bolts to 47 N·m (35 ft. lbs.).

(8) Torque the engine mount sill plate bolts to 41 N·m (30 ft. lbs.).

(9) Torque the larger trackbar support bracket bolts to 125 N·m (92ft. lbs.).

(10) Remove the jack stand.

(11) Install the H-Block on the A/C compressor in its original position and leave the bolts loose at this time.

(12) Position and install the A/C compressor.

(13) Slide the drive coupler in its original position and install the remaining (2) H-Block bolts.

(14) Install the power steering pump pulley (Fig. 7). Torque nut to 166 N·m (120 ft. lbs.).

80b9a4be

Fig. 6 Engine Mount Retaining Bolts

- 1 - TRACK BAR SUPPORT BRACKET RETAINING BOLTS
- 2 - ENGINE MOUNT SILL PLATE BOLT

(15) Install the accessory drive belt. See Group 7, Cooling System for procedure.

(16) Torque all the H-Block bolts.

REMOVAL AND INSTALLATION (Continued)

(17) Install the steering shaft. Torque the steering shaft pinch bolt to 49 N·m (36 ft. lbs.).

(18) Install the pressure line on steering gear. Torque nut to 28 N·m (21 ft. lbs.).

(19) Install the power steering fluid supply hose on the pump.

(20) Lower the vehicle from the hoist.

(21) Install and torque the engine mount upper sill plate nuts to 41 N·m (30 ft. lbs.) (Fig. 8).

(22) Connect the A/C compressor electrical connector.

(23) Install the A/C line support bracket bolt at the rear of the valve cover.

(24) Fill the power steering fluid. See Group 19, Steering for Power Steering Pump-Initial operation procedure.

(25) Connect the negative battery cable.

POWER STEERING PUMP — RHD**Removal**

(1) Disconnect the negative battery cable.

(2) Remove the refrigerant line support bracket bolt from the top of the radiator.

(3) Remove the A/C filter-drier assembly support bracket nuts from left fender well.

(4) Disconnect the A/C compressor electrical connector.

(5) Raise the vehicle on a hoist.

80b9a4c1

Fig. 8 Engine Mount Sill Plate Nuts

- 1 – SILL PLATE NUTS
- 2 – STEERING SHAFT
- 3 – ENGINE MOUNT

(6) Remove the power steering fluid supply hose from pump and drain fluid.

(7) Remove power steering line support bracket bolt from below radiator.

(8) Remove the engine mount upper sill plate nuts.

(9) Loosen the (4) H-Block retaining bolts. Do not remove at this time.

(10) Remove the accessory drive belt from the power steering pump pulley. See Group 7, Cooling System for procedure.

(11) Remove the power steering pump pulley. Use a hex socket to secure the pump shaft while removing the pulley nut with a box wrench (Fig. 9).

NOTE: Mark position of the H-Block in relation to the A/C Compressor so it can be installed in the same position.

(12) Remove the (2) bolts retaining the H-Block to the power steering pump shaft coupler.

(13) Loosen the coupler pinch bolt and slide coupler towards pump.

(14) Remove the left engine mount throughbolt nut only. Do not remove the bolt at this time.

(15) Remove the remaining 2 bolts from the H-Block and remove the H-Block from the compressor.

(16) Position a jack stand and raise weight off left engine mount.

(17) Remove the (2) engine mount sill plate bolts.

(18) Remove the (4) engine mount bracket bolts from the engine block.

REMOVAL AND INSTALLATION (Continued)

- 2 - HEX WRENCH
- 3 - POWER STEERING PUMP PULLEY
- 4 - BOX WRENCH

(19) Remove the engine mount throughbolt.

(20) Remove the engine mount and engine mount bracket from vehicle.

(21) Remove the (2) power steering pump retaining nuts (Fig. 10).

(22) Slide pump off mounting studs and position so pressure line can be removed. This will require you to install pressure line on the new pump prior to installing it in the engine block.

(23) Remove the power steering pump from the vehicle.

Installation

WARNING: Power steering system fluid may be contaminated with metal shavings, overheated or improper fluid. All fluid should be drained from the system. After component replacement, system should be flushed and filled with Mopar Power Steering Fluid, or equivalent.

(1) Install the pressure line on pump in original position.

(2) Transfer the drive coupler to new pump leaving pinch bolt loose at this time (Fig. 11).

(3) Install the power steering pump in the engine block. Torque retaining nuts to 24 N·m (18 ft. lbs.) (Fig. 11).

(4) Install the engine mount and engine mount bracket in vehicle.

80b9a49b

REMOVAL AND INSTALLATION (Continued)

- (5) Install the engine mount throughbolt and leave loose at this time.
- (6) Install, do not torque engine mount sill plate nuts and bolts.
- (7) Install (4) engine mount bracket to engine block retaining bolts and Torque to 61 N·m (45 ft. lbs.).
- (8) Torque the engine mount sill plate nuts to 41 N·m (30 ft. lbs.).
- (9) Torque the engine mount sill plate bolts to 41 N·m (30 ft. lbs.).
- (10) Remove jack stand.
- (11) Install the H-Block on the A/C compressor in the original position and leave bolts loose at this time.
- (12) Position and install A/C compressor.
- (13) Slide the drive coupler into its original position and start remaining (2) H-Block bolts.
- (14) Install the power steering pump pulley (Fig. 12). Torque nut to 166 N·m (120 ft. lbs.).

**Fig. 12 Installing Pump Pulley**

- 1 - LEVERAGE PIPE
- 2 - HEX WRENCH
- 3 - POWER STEERING PUMP PULLEY
- 4 - BOX WRENCH

- (15) Install the accessory drive belt. See Group 7, Cooling for procedure.
- (16) Torque all the H-Block bolts.
- (17) Torque the engine mount throughbolt nut to 65 N·m (48 ft. lbs.).
- (18) Install the power steering fluid supply hose on pump.
- (19) Install the power steering line support bracket bolt.
- (20) Lower the vehicle from hoist.

- (21) Install the refrigerent line support bracket and bolt on the top of the radiator.
- (22) Install the A/C filter-drier assembly support bracket nuts on the left fender well.
- (23) Reconnect the A/C compressor electrical connector.
- (24) Re-fill the power steering fluid. Refer to Group 19, Steering for Power Steering Pump-Initial Operation for procedure.
- (25) Connect the negative battery cable.

STEERING GEAR - RHD

REMOVAL

- (1) Open the hood and disconnect the negative battery cable.
- (2) Place the front wheels in the straight ahead position and lock the steering wheel.

CAUTION: Be certain to lock the steering wheel in position prior to disconnecting the steering column coupler. This will prevent clockspring damage.

- (3) Disconnect the power steering pressure and return lines from the steering gear (Fig. 13).

**Fig. 13 Power Steering Fluid Pressure and Return Line Location - RHD**

- 1 - POWER STEERING FLUID RETURN LINE
- 2 - POWER STEERING FLUID PRESSURE LINE
- 3 - AIR FILTER COVER

- (4) Remove the steering column coupler pinch bolt. Located just to the rear of the fluid lines (Fig. 13).

REMOVAL AND INSTALLATION (Continued)

(5) Separate steering shaft from gearbox by pulling straight apart.

(6) Raise the vehicle on a hoist.

(7) Remove the stabilizer bar clamp retaining bolts from the frame (Fig. 14). Allow stabilizer bar to hang free.

Fig. 14 Steering Gear

- 1 - LOWER RADIATOR HOSE/CLAMP
- 2 - STEERING GEAR
- 3 - PITMAN ARM
- 4 - STABILIZER BAR RETAINING BOLTS
- 5 - POWER STEERING FLUID PRESSURE LINE
- 6 - POWER STEERING FLUID RETURN LINE

(8) Remove the Pittman arm from the steering gear (Fig. 14). Refer to Group 19, Steering for the procedure.

(9) Remove the small right front splash from the vehicle.

(10) Remove the (3) steering gear retaining bolts (Fig. 15).

(11) Rotate the lower radiator hose clamp, so that the tangs are facing straight down. This will aid in gear removal.

(12) Remove the steering gear from the vehicle.

INSTALLATION

(1) Center the steering gear travel. Rotate gear output shaft until stop. Make a reference mark in the same position on the gear shaft and gear housing.

Fig. 15 Steering Gear Retaining Bolts

- 1 - STEERING GEAR RETAINING BOLTS
- 2 - VEHICLE FRAME RAIL

Rotate gear shaft in the opposite direction until stop while noting the number of turns. Divide that number in half and position the reference mark made previously at that position.

(2) Install the steering gear in the vehicle.

(3) Install the (3) steering gear retaining bolts. Torque to 95 N·m (70 ft. lbs.).

(4) Install the small right front splash on the vehicle.

(5) Install the Pittman arm on the steering gear. Refer to Group 19, Steering for the procedure. Torque nut to 251 N·m (185 ft. lbs.).

(6) Position the stabilizer bar and install the clamp retaining bolts. Refer to Group 2, Suspension for a detailed procedure. Torque the bolts to 75 N·m (40 ft. lbs.).

(7) Lower the vehicle on the hoist.

(8) Install the steering column shaft coupler on the steering gear and install pinch bolt. Torque the bolt to 35 N·m (26 ft. lbs.).

(9) Install the power steering pressure and return lines on the steering gear. Torque the lines to 28 N·m (21 ft. lbs.).

(10) Connect the negative battery cable.

(11) Check and correct vehicle front end alignment specifications if necessary. Refer to Group 2, Suspension for the procedure.

DESCRIPTION AND OPERATION

AX5 MANUAL TRANSMISSION

DESCRIPTION

The AX5 is a five speed manual transmission with fifth gear being the overdrive range. An adapter housing is used to attach the transmission to the transfer case on 4-wheel drive applications. A standard style extension housing is used for the 2-wheel drive applications. The shift mechanism is integral to the transmission assembly and mounted in the shift tower portion of the adapter/extension housing (Fig. 1).

GEAR RATIOS

Gear ratios for the AX5 manual transmission are as follows:

- First gear: 3.93:1

- Second gear: 2.33:1
- Third gear: 1.45:1
- Fourth gear: 1.00:1
- Fifth gear: 0.85:1
- Reverse gear: 4.74:1

TRANSMISSION IDENTIFICATION

The AX5 identification code is on the bottom surface of the transmission case near the fill plug (Fig. 2). The first number is year of manufacture. The second and third numbers indicate month of manufacture. The next series of numbers is the transmission serial number.

OPERATION

The manual transmission receives power through the clutch assembly from the engine. The clutch disc is splined to the transmission input shaft and is turned at engine speed at all times that the clutch is

DESCRIPTION AND OPERATION (Continued)

80abfee7

Fig. 1 AX5 Manual Transmission

80abfee5

Fig. 2 Transmission Identification

1 - I. D. CODE ON CASE NEAR DRAIN PLUG

engaged. The input shaft is connected to the transmission countershaft through the mesh of fourth speed gear on the input shaft and the fourth countershaft gear. At this point, all the transmission gears are spinning.

The driver selects a particular gear by moving the shift lever to the desired gear position. This movement moves the internal transmission shift compo-

nents to begin the shift sequence. As the shift lever moves the selected shift rail, the shift fork attached to that rail begins to move. The fork is positioned in a groove in the outer circumference of the synchronizer sleeve. As the shift fork moves the synchronizer sleeve, the synchronizer begins to speed-up or slow down the selected gear (depending on whether we are up-shifting or down-shifting). The synchronizer does this by having the synchronizer hub splined to the mainshaft, or the countershaft in some cases, and moving the blocker ring into contact with the gear's friction cone. As the blocker ring and friction cone come together, the gear speed is brought up or down to the speed of the synchronizer. As the two speeds match, the splines on the inside of the synchronizer sleeve become aligned with the teeth on the blocker ring and the friction cone and eventually will slide over the teeth, locking the gear to the mainshaft, or countershaft, through the synchronizer.

LUBRICANT

DESCRIPTION

Recommended lubricant for AX5 transmissions is Mopar® 75W-90, API Grade GL-3 gear lubricant, or equivalent.

Correct lubricant level is from the bottom edge, to no more than 6 mm (1/4 in.) below the bottom edge of the fill plug hole.

The fill plug is on the passenger side of the adapter housing (Fig. 3). The drain plug is on the bottom of the case.

DESCRIPTION AND OPERATION (Continued)

Approximate dry fill lubricant capacity is:

- 3.3 liters (3.49 quarts) for 4-wheel drive applications.
- 3.5 liters (3.70 quarts) for 2-wheel drive applications.

J8921-4

Fig. 3 Fill Plug Location

1 – FILL PLUG LOCATION

DIAGNOSIS AND TESTING

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill, or an incorrect lubricant level check.

Leaks can occur at the mating surfaces of the gear case, intermediate plate and adaptor or extension housing, or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at the rear of the extension or adapter housing will be from the housing oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening, or use of a non-recommended sealer.

A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab, and/or chatter.

A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper, or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind, and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Component damage, incorrect clutch adjustment, or a damaged clutch pressure plate or disc are additional probable causes of increased shift effort. Incorrect adjustment or a worn/damaged pressure plate or disc can cause incorrect release. If the clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases, this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe, highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper, or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear breakage.

REMOVAL AND INSTALLATION

TRANSMISSION

REMOVAL

- (1) Shift transmission into first or third gear.
- (2) Raise and support vehicle on suitable safety stands.
- (3) Support engine with adjustable jack stand. Position wood block between jack and oil pan to avoid damaging pan.
- (4) Remove crossmember/skid plate.
- (5) Disconnect necessary exhaust system components.
- (6) Remove skid plate, if equipped.
- (7) Remove slave cylinder (Fig. 4) from clutch housing.
- (8) Mark rear propeller shaft and rear axle yokes for installation alignment (Fig. 5).

REMOVAL AND INSTALLATION (Continued)

**Fig. 4 Slave Cylinder—Typical**

1 – CLUTCH SLAVE CYLINDER

J9316-2

Fig. 5 Marking Propeller Shaft And Axle Yokes

1 – REFERENCE MARKS

(9) Mark front propeller shaft, axle, and transfer case yokes for installation alignment, if equipped.

(10) Remove propeller shaft(s).

(11) Unclip wire harnesses from transmission and transfer case, if equipped.

(12) Disconnect transfer case vent hose, if equipped.

(13) Disengage any wire connectors attached to transmission or transfer case, if equipped, components.

(14) Support transfer case, if equipped, with transmission jack.

(15) Secure transfer case, if equipped, to jack with safety chains.

(16) Disconnect transfer case shift linkage at transfer case, if equipped.

(17) Remove nuts attaching transfer case to transmission, if equipped.

(18) Remove transfer case, if equipped.

(19) Remove crankshaft position sensor (Fig. 6).

**Fig. 6 Crankshaft Position Sensor —2.5 and 4.0L Engine**

1 – ENGINE SPEED SENSOR

2 – GROMMET

3 – MOUNTING BOLT(S)

4 – LEFT REAR OF ENGINE

5 – TRANSMISSION

CAUTION: It is important that the crankshaft position sensor be removed prior to transmission removal. The sensor can easily be damaged if left in place during removal operations.

(20) Support engine with adjustable jack stand. Position wood block between jack and oil pan to avoid damaging pan.

(21) Support transmission with transmission jack.

(22) Secure transmission to jack with safety chains.

(23) Disconnect rear cushion and bracket from transmission.

(24) Remove rear crossmember.

(25) Disconnect transmission shift lever as follows:
(a) Lower transmission approximately 7–8 cm (3 in.) for access to shift lever.

(b) Reach up and around transmission case and unseat shift lever dust boot from transmission shift tower (Fig. 7). Move boot upward on shift lever for access to retainer that secures lever in shift tower.

(c) Reach up and around transmission case and press shift lever retainer downward with finger pressure. Turn retainer counterclockwise to release it.

(d) Lift lever and retainer out of shift tower (Fig. 7). Do not remove the shift lever from the floor con-

REMOVAL AND INSTALLATION (Continued)

sole shifter boots. Leave the lever in place for transmission installation.

Fig. 7 Removing/Installing Shift Lever

- 1 - SHIFT LEVER RETAINER
- 2 - DUST BOOT
- 3 - SHIFT TOWER

- (26) Remove clutch housing brace rod.
- (27) Remove clutch housing-to-engine bolts.
- (28) Pull transmission jack rearward until input shaft clears clutch. Then slide transmission out from under vehicle.
- (29) Remove clutch release bearing, release fork, and retainer clip.
- (30) Remove clutch housing from transmission (Fig. 8).

INSTALLATION

- (1) Install clutch housing (Fig. 8) on transmission. Tighten housing bolts to 46 N·m (34 ft. lbs.) torque.
- (2) Lubricate contact surfaces of release fork pivot ball stud and release fork with high temp grease.
- (3) Install release bearing, fork, and retainer clip.
- (4) Position and secure transmission on transmission jack.
- (5) Lightly lubricate pilot bearing and transmission input shaft splines with Mopar® high temp grease.
- (6) Raise transmission and align transmission input shaft and clutch disc splines. Then slide transmission into place.
- (7) Install and tighten clutch housing-to-engine bolts to the appropriate torque: **Be sure the housing is properly seated on engine block before tightening bolts.**
 - Tighten 3/8" diameter bolts to 37 N·m (27 ft.lbs.).
 - Tighten 7/16" diameter bolts to 58 N·m (43 ft.lbs.).

Fig. 8 Clutch Housing

- 1 - HOUSING-TO-TRANSMISSION BOLTS (46 N·m/34 ft. lbs.)
- 2 - CLUTCH HOUSING
- 3 - TRANSMISSION

- Tighten M12 bolts to 75 N·m (55 ft.lbs.).
- (8) Install clutch housing brace rod.
- (9) Lower transmission approximately 7-8 cm (3 in.) for access to shift tower. Be sure transmission is in first or third gear.
- (10) Reach up and around transmission and insert shift lever in shift tower. Press lever retainer downward and turn it clockwise to lock it in place. Then install lever dust boot on shift tower.
- (11) Install rear crossmember. Tighten crossmember-to-frame bolts to 41 N·m (31 ft. lbs.) torque.
- (12) Install fasteners to hold rear cushion and bracket to transmission. Then tighten transmission-to-rear support bolts/nuts to 54 N·m (40 ft. lbs.) torque.
- (13) Remove support stands from engine and transmission.
- (14) Install and connect crankshaft position sensor.
- (15) Position transfer case on transmission jack, if equipped.
- (16) Secure transfer case to jack with safety chains, if equipped.
- (17) Raise transfer case, if equipped, and align transfer case input shaft to the transmission output shaft.

REMOVAL AND INSTALLATION (Continued)

(18) Slide transfer case forward until case is seated on transmission, if necessary.

(19) Install nuts to attach transfer case to transmission, if equipped. Tighten transfer case-to-transmission nuts to 35 N·m (26 ft. lbs.) torque.

(20) Connect transfer case shift linkage at transfer case, if equipped.

(21) Connect transfer case vent hose, if equipped.

(22) Secure wire harnesses in clips/tie straps on transmission and transfer case, if equipped.

(23) Engage wire connectors attached to all necessary transmission or transfer case, if equipped, components.

(24) Install rear propeller shaft slip yoke to transmission or transfer case, if equipped, output shaft.

(25) Align marks on rear propeller shaft and rear axle yokes (Fig. 9).

J9316-2

Fig. 9 Align Propeller Shaft And Rear Axle Yokes Alignment Marks

1 - REFERENCE MARKS

(26) Install and tighten propeller shaft U-joint clamp bolts to 19 N·m (170 in. lbs.) torque.

(27) Align marks on front propeller shaft, axle, and transfer case yokes, if equipped.

(28) Install and tighten propeller shaft U-joint clamp bolts to 19 N·m (170 in. lbs.) torque.

(29) Install slave cylinder in clutch housing.

(30) Install skid plate, if equipped. Tighten bolts to 42 N·m (31 ft. lbs.) torque. Tighten stud nuts to 17 N·m (150 in. lbs.) torque.

(31) Fill transmission and transfer case, if equipped, with recommended lubricants. Refer to the Lubricant Recommendation sections of the appropriate component for correct fluid.

(32) Lower vehicle.

FRONT BEARING RETAINER SEAL

REMOVAL

(1) Remove release bearing and lever from the transmission.

(2) Remove the bolts holding the front bearing retainer to the transmission case.

(3) Remove the front bearing retainer from the transmission case.

(4) Using a suitable pry tool, remove the front bearing retainer seal.

INSTALLATION

(1) Using Tool Handle C-4171 and Seal Installer 8211, install new seal in to the front bearing retainer (Fig. 10).

80b099ca

Fig. 10 Install Front Bearing Retainer Seal

1 - SPECIAL TOOL C-4171

2 - SPECIAL TOOL 8211 (AX5) OR 8209 (AX15)

(2) Remove any residual gasket material from the sealing surfaces of the bearing retainer and the transmission case.

(3) Install new front bearing retainer gasket to the front bearing retainer.

(4) Install the front bearing retainer onto the transmission case.

(5) Install the bolts to hold the bearing retainer onto the transmission case.

(6) Tighten the bolts to 17 N·m (12 ft. lbs.).

(7) Install release bearing and lever onto the transmission.

REMOVAL AND INSTALLATION (Continued)

EXTENSION HOUSING SEAL

REMOVAL

- (1) Raise and support vehicle.
- (2) Remove propeller shaft. Refer to Group 3, Differential and Driveline, for proper procedures.
- (3) Using a suitable seal puller or screw with a slide hammer, remove the extension housing seal (Fig. 11).

J9121-385

Fig. 11 Remove Extension Housing Seal

- 1 - SLIDE HAMMER
2 - SEAL PULLER
3 - 2WD EXTENSION HOUSING

INSTALLATION

- (1) Clean seal bore of extension housing of any residual sealer material from original seal.
- (2) Using Tool Handle C-4171 and Seal Installer 8212, install new extension housing seal so that the seal is located 0 ± 0.5 mm (0 ± 0.02 in.) to the face of the extension housing (Fig. 12).
- (3) Install propeller shaft. Refer to Group 3, Differential and Driveline, for proper procedures.
- (4) Check and add fluid to transmission as necessary. Refer to the Recommended Lubricant section for proper fluid requirements.
- (5) Lower vehicle.

ADAPTER HOUSING SEAL

REMOVAL

- (1) Hoist and support vehicle.
- (2) Remove transfer case.
- (3) Using a suitable pry tool, or a slide hammer mounted screw, remove the adapter housing seal (Fig. 13).

(7) On 4x2 transmissions;

(a) Install speedometer drive gear locating snap-ring (Fig. 36).

(b) Install speedometer gear lock ball in output shaft and install speedometer gear onto output shaft.

(c) Install speedometer gear retaining snap-ring onto output shaft.

(8) Apply a 1/8 to 3/16 inch wide bead of Threebond® Liquid Gasket TB1281, P/N 83504038, to sealing surface of adapter/extension housing, making sure to keep sealer bead to inside of bolt holes.

(9) Install adapter or extension housing on intermediate plate (Fig. 37). Tighten housing bolts to 34 N·m (25 ft. lbs.) torque.

(10) Position shift arm in shifter tower opening of adapter or extension housing (Fig. 38). Be sure that the shifter arm is engaged into the shift rails.

(19) Install shift tower gasket onto shift tower.
(20) Install the shift tower oil deflector and gasket onto the adapter or extension housing.
(21) Install shift tower onto transmission case (Fig. 46).

(22) Install bolts to hold shift tower to transmission case. Tighten tower bolts to 18 N·m (13 ft. lbs.) torque.

(25) Install new seal in adapter/extension housing.
(26) Install vehicle speed sensor, if necessary.
(27) Install clutch housing, release bearing, release fork and retainer clip.

DISASSEMBLY AND ASSEMBLY (Continued)

SHIFT MECHANISM AND GEARTRAIN

DISASSEMBLY

(1) Install suitable bolts and washers in intermediate plate (Fig. 48). Then clamp plate and gear assembly in vise. Use enough washers to prevent bolts from touching. Also be sure vise jaws are clamped on bolt heads.

J8921-15

Fig. 48 Positioning Intermediate Plate In Vise

ASSEMBLY

Refer to (Fig. 74) while assembling and installing the shift rail components. Also, verify that all shift rail components are in their neutral position when installing the check balls and interlock pins.

(1) Install the 3-4 shift rail into the intermediate plate.

(2) Install the 1-2 elongated check ball into the intermediate plate (Fig. 75).

(3) Install the interlock pin into the 1-2 shift rail (Fig. 76).

(4) Install the 1-2 shift rail into the intermediate plate.

- 1 - REVERSE SHIFT RAIL
2 - INTERLOCK PIN

**Fig. 79 Install Reverse Arm Bracket to Fork**

- 1 - REVERSE SHIFT FORK
2 - REVERSE ARM BRACKET

- (9) Install reverse shift rail into intermediate plate and position reverse arm bracket to intermediate plate (Fig. 80).

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 80 Install Reverse Shift Rail**

1 - REVERSE SHIFT RAIL AND REVERSE FORK ASSEMBLY

(10) Install snap-ring onto reverse shift rail (Fig. 81).

**Fig. 81 Install Reverse Snap-ring**

1 - SNAP RING

2 - REVERSE SHIFT RAIL

(11) Install reverse shift head and rail assembly into the intermediate plate.

(12) Install the fifth gear interlock ball and check ball (Fig. 82).

**Fig. 82 Install Fifth Gear Check Ball**

1 - FIFTH GEAR CHECK BALL

(13) Install fifth gear shift rail (Fig. 83).

**Fig. 83 Install Fifth Gear Shift Rail**

1 - INTERMEDIATE PLATE

2 - FIFTH GEAR SHIFT RAIL

(14) Remove the intermediate plate from the vise, rotate the plate 180°, and reinstall the plate in the vise using the same bolt and washer mounting set-up.

(15) Install the shift rail detent balls in the intermediate plate.

DISASSEMBLY AND ASSEMBLY (Continued)

(16) Install the shift rail detent springs in the intermediate plate. Note that the bottom detent spring is shorter than the others.

(17) Install the shift rail detent plugs in the intermediate plate.

(18) Install the 1-2 shift fork onto the 1-2 and 3-4 shift rails (Fig. 84).

(19) Install the snap-ring onto the 1-2 shift rail.

(20) Install the 3-4 shift fork onto the 3-4 shift rail (Fig. 85).

Fig. 84 Install 1-2 Shift Fork

- 1 - 1-2 SHIFT FORK
- 2 - 3-4 SHIFT RAIL
- 3 - 1-2 SHIFT RAIL

Fig. 85 Install 3-4 Shift Fork

- 1 - 3-4 SHIFT FORK
- 2 - 3-4 SHIFT RAIL
- 3 - 1-2 SHIFT RAIL
- 4 - 1-2 SHIFT FORK

(21) Install mainshaft into the intermediate plate by guiding the output shaft through opening in intermediate plate until the shift forks are aligned with the appropriate synchronizer sleeves. The mainshaft rear bearing will be started in the intermediate plate but not fully driven in at this point.

(22) While an assistant supports the mainshaft, align rear of countershaft with inner race of countershaft rear bearing.

(23) Raise countershaft upward until gears mesh with the mating gears on the mainshaft.

(24) Using a suitable rubber mallet, tap on the input shaft and the front of the countershaft equally to install the mainshaft rear bearing into the intermediate plate and the rear of the countershaft into the rear countershaft bearing. It may be necessary to occasionally hold the countershaft into the intermediate plate and tap the countershaft rear bearing onto the countershaft and into the intermediate plate.

(25) Install snap-rings onto the rear mainshaft and countershaft bearings.

(26) Install the bolts to hold the reverse shift arm bracket to the intermediate plate.

(27) Install new bolts to hold the shift forks to the shift rails (Fig. 86).

Fig. 86 Install Shift Fork Bolts

- 1 - 1-2 SHIFT FORK
- 2 - 3-4 SHIFT FORK

(28) Position the mainshaft rear bearing retainer over the output shaft and onto the intermediate plate.

(29) Install new bolts to hold the bearing retainer to the intermediate plate.

(30) Move the reverse shift arm into the reverse gear position. The reverse gear position is with the arm moved away from the intermediate plate (Fig. 87).

(31) Install the reverse idler gear assembly into position on the mainshaft and reverse shift arm.

DISASSEMBLY AND ASSEMBLY (Continued)

(32) Install the compression spring and pin into the reverse idler gear shaft (Fig. 88).

(33) Install the reverse idler shaft through the intermediate plate and reverse idler gear assembly (Fig. 89) until the idler shaft pin contacts the gear assembly. Make sure that the notched cut-out in the idler shaft is to the rear of the transmission.

Fig. 87 Reverse Shift Arm Position

- 1 - REVERSE SHIFT ARM
2 - INTERMEDIATE PLATE

Fig. 88 Install Compression Spring And Pin

- 1 - REVERSE IDLER GEAR SHAFT
2 - PIN
3 - COMPRESSION SPRING

Fig. 89 Install Reverse Idler Shaft

- 1 - REVERSE IDLER SHAFT

(34) Align the pin with the alignment notch in the reverse idler gear assembly (Fig. 90). The alignment notch in the reverse idler gear race/hub is a small relief cut above one of the main longitudinal slots. Be sure that the pin is aligned with the proper slot, the opposite slot has an oil drain hole which the pin will drop into. The assembly will then be locked onto the shaft and will need to be disassembled in order to be removed.

(35) Depress compression spring and pin in reverse idler gear shaft (Fig. 91).

Fig. 90 Align Idler Shaft Pin

- 1 - REVERSE IDLER GEAR ASSEMBLY
2 - ALIGNMENT NOTCH

(36) Install the reverse idler gear shaft the remainder of the way through the reverse idler gear assembly.

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 91 Depress Pin In Reverse Idler Gear Shaft

1 - DEPRESS PIN

(37) Position the reverse idler gear shaft lock plate onto the intermediate plate.

(38) Install a new bolt to hold the idler gear shaft lock plate to the intermediate plate.

(39) Install the fifth gear thrust ring lock ball to the countershaft (Fig. 92).

(40) Install the fifth gear thrust ring onto the countershaft and over the lock ball (Fig. 93).

Fig. 92 Install Fifth Gear Thrust Ring Lock Ball

1 - PENCIL MAGNET
2 - CLUSTER GEAR
3 - LOCK BALL RECESS
4 - THRUST RING LOCK BALL

(41) Install fifth gear shift fork to the countershaft fifth gear assembly.

(42) Install the countershaft fifth gear bearings into the countershaft fifth gear assembly.

(43) Position the countershaft fifth gear assembly on the countershaft. Ensure that the fifth gear fork is installed onto the fifth gear shift rail.

Fig. 93 Install Fifth Gear Thrust Ring

1 - LOCK BALL NOTCH
2 - FIFTH GEAR THRUST RING

(44) Install the fifth gear synchro ring.

(45) Position the fifth gear blocker ring onto the countershaft.

(46) Using a suitable mallet and spacer, tap the fifth gear blocker ring onto the countershaft.

(47) Install new bolt to hold fifth gear shift fork to the fifth gear shift rail (Fig. 94).

Fig. 94 Install Fifth Gear Retainer Bolt

1 - SHIFT FORK RETAINER BOLT
2 - FIFTH GEAR SHIFT RAIL
3 - FIFTH GEAR SHIFT FORK

(48) Measure countershaft fifth gear thrust clearance.

(49) Select a snap-ring so that the thrust clearance is 0.10–0.30 mm (0.004–0.010 in.).

(50) Install snap-ring to hold fifth gear blocker ring onto countershaft.

DISASSEMBLY AND ASSEMBLY (Continued)

(51) Remove intermediate plate from vise and remove bolts and washers from intermediate.

COUNTERSHAFT

DISASSEMBLY

(1) Remove select fit snap-ring holding the countershaft front bearing onto the countershaft (Fig. 95).

(2) Using Bearing Splitter P-334, a suitable spacer on center of countershaft, and a shop press, remove the countershaft front bearing from the countershaft.

I. D. MARK	SNAP RING THICKNESS MM (IN.)	
1	2.05 - 2.10	(0.0807 - 0.0827)
2	2.10 - 2.15	(0.0827 - 0.0846)
3	2.15 - 2.20	(0.0846 - 0.0866)
4	2.20 - 2.25	(0.0866 - 0.0886)
5	2.25 - 2.30	(0.0886 - 0.0906)
6	2.30 - 2.35	(0.0906 - 0.0925)

80ac6a0a

Fig. 95 Countershaft Front Bearing Snap-ring

ASSEMBLY

(1) Remove any nicks or burrs on countershaft hub with fine emery or crocus cloth.

(2) Position countershaft front bearing on end of countershaft.

(3) Using Special Tool 8109 and a shop press, press bearing onto countershaft.

(4) Select the thickest snap-ring that will fit into the snap-ring groove of the countershaft (Fig. 95).

(5) Install snap-ring to hold countershaft front bearing onto countershaft.

INPUT SHAFT

DISASSEMBLY

(1) Verify that the 3-4 synchronizer is in the neutral position.

(2) Separate input shaft from output shaft (Fig. 96). Note that the output shaft pilot bearing is an uncaged roller type bearing.

(3) Remove the output shaft pilot bearing rollers from the input shaft and the output shaft.

J8921-1089

Fig. 96 Separate Input and Output Shafts

1 - INPUT SHAFT ASSEMBLY

2 - OUTPUT SHAFT AND GEAR ASSEMBLY

(4) Remove the fourth gear synchronizer ring from the input shaft (Fig. 97).

J8921-1091

Fig. 97 Input Shaft Components

1 - BEARING

2 - SYNCHRO RING

3 - INPUT SHAFT

4 - BEARING SNAP RING

(5) Remove the select fit snap-ring holding the input shaft bearing onto the input shaft.

(6) Using Bearing Splitter P-334 and a shop press, remove the bearing from the input shaft.

ASSEMBLY

(1) Position input shaft bearing onto input shaft.

(2) Using Driver L-4507, drive bearing onto input shaft.

(3) Select the thickest snap-ring that will fit into the snap-ring groove of the input shaft (Fig. 98).

(4) Lubricate output shaft pilot bearing bore of input shaft with petroleum jelly.

DISASSEMBLY AND ASSEMBLY (Continued)

I. D. Mark	Snap Ring Thickness mm (in.)
0	2.05-2.10 (0.0807-0.0827)

5	2.30-2.35 (0.0906-0.0925)

J8921-50

Fig. 98 Select Input Shaft Bearing Snap-ring

(5) Install output shaft pilot bearing rollers in input shaft bore (Fig. 99). Ensure to use sufficient petroleum jelly to hold rollers in position.

J8921-64

Fig. 99 Install Output Shaft Pilot Bearing Rollers

- 1 - INPUT SHAFT
2 - BEARING ROLLERS

(6) Install the fourth gear synchronizer ring onto the input shaft.

(7) Install input shaft to output shaft. Use care when mating the two shafts not to displace any output shaft pilot bearing rollers.

OUTPUT SHAFT**DISASSEMBLY**

(1) Remove input shaft and output shaft pilot bearing rollers from output shaft.

(2) Measure and note thrust clearance of output shaft gears (Fig. 100). Clearance should be 0.10 - 0.25 mm (0.004 - 0.010 in.).

J8921-36

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Remove output shaft fifth gear snap ring with two screwdrivers (Fig. 101).

J8921-37

Fig. 101 Remove Fifth Gear Snap-ring

1 - SNAP RING

(4) Using Bearing Splitter P-334 or suitable press plates positioned under first gear, press fifth gear, rear bearing, first gear, and first gear bearing inner race off output shaft (Fig. 102).

(5) Remove first gear needle roller bearing from output shaft.

(6) Remove first gear bearing inner race lock ball with pencil magnet (Fig. 103).

(7) Remove first gear synchronizer ring.

(8) Using Bearing Splitter P-334 or suitable press plates positioned under second gear, press 1-2 synchronizer, reverse gear, and second gear from output shaft (Fig. 104).

(9) Remove second gear needle roller bearing from the output shaft or second gear.

(10) Remove select fit snap-ring holding the 3-4 synchronizer onto the output shaft (Fig. 105).

(11) Using Bearing Splitter P-334 or suitable press plates positioned under third gear, press the 3-4 synchronizer and third gear from output shaft (Fig. 106).

(12) Remove third gear needle roller bearing from output shaft or gear.

ASSEMBLY

TRANSMISSION ASSEMBLY INFORMATION

Lubricate the transmission components with Mopar® 75W-90, GL 3 gear lubricant during assembly. Use petroleum jelly to lubricate seal lips and/or hold parts in place during installation.

Refer to (Fig. 107) during assembly for AX5 gear assembly identification.

(1) Lubricate transmission components with specified gear lubricant.

(2) If necessary, assemble 1-2 and 3-4 synchronizer hubs, sleeves, springs and key inserts (Fig. 108).

(3) Install third gear needle bearing onto the output shaft.

(4) Install third gear over bearing and onto output shaft flange.

(5) Install third gear synchronizer ring to third gear.

(6) Position the 3-4 synchronizer onto the output shaft.

(7) Using Adapter 6747-1A and a shop press, press the 3-4 synchronizer onto the output shaft.

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 107 Geartrain Components**

- 7 - SNAP RING
- 8 - SPACER
- 9 - COUNTER 5TH GEAR
- 10 - SYNCHRO RING
- 11 - 5TH SPLINE GEAR
- 12 - SNAP RING

(8) Select the thickest snap-ring that will fit into the snap-ring groove of the output shaft (Fig. 109).

(9) Install snap-ring to hold 3-4 synchronizer onto output shaft.

(10) Verify third gear thrust clearance with feeler gauge (Fig. 110). Clearance should be 0.10 - 0.25 mm (0.004 - 0.010 in.). If clearance is out of specification, refer to Cleaning and Inspection section within this group.

(11) Install second gear needle bearing onto output shaft.

(12) Install second gear over bearing and onto output shaft flange.

(13) Install second gear synchronizer ring onto second gear.

(14) Position 1-2 synchronizer assembly onto splines of output shaft.

(15) Using Driver MD-998805, Adapter 6747-1A, and a shop press, press the 1-2 synchronizer onto the output shaft.

2 – REVERSE IDLER GEAR HUB

ASSEMBLY

(1) Install the reverse idler gear synchronizer ring onto the reverse idler gear hub/race. Apply a film of 75W-90 GL-3 transmission oil to the contact surface of the synchronizer ring prior to assembly.

(2) Install the reverse idler gear onto the reverse idler gear hub/race. Apply a film of 75W-90 GL-3 transmission oil to the reverse idler gear bushing prior to assembly. Verify that the teeth on the synchronizer ring are properly engaged into the recesses of the reverse idler gear.

(3) Install the plate washer over the reverse idler gear hub/race and onto the reverse idler gear.

(4) Install the snap-ring to hold the reverse idler gear onto the reverse idler hub/race.

CLEANING AND INSPECTION**AX5 MANUAL TRANSMISSION COMPONENTS****GENERAL INFORMATION**

Clean the transmission components in solvent. Dry the cases, gears, shift mechanism and shafts with compressed air. Dry the bearings with clean, dry shop towels only. Never use compressed air on the bearings. This could cause severe damage to the bearing roller and race surfaces.

If output shaft or inner race flange thickness is within specification but any gear thrust clearance is out of specification, replace the necessary gear and gear needle bearing as an assembly.

GEAR CASE, ADAPTER/EXTENSION HOUSING, INTERMEDIATE PLATE

Clean the case, housing, and intermediate plate with solvent and dry with compressed air. Replace the case if cracked, porous, or if any of the bearing and gear bores are damaged.

Inspect the threads in the case, housing, and plate. Minor thread damage can be repaired with steel thread inserts, if necessary. Do not attempt to repair any threads which show evidence of cracks around the threaded hole.

OUTPUT SHAFT

Check thickness of the output shaft and inner bearing race flanges with a micrometer or vernier calipers (Fig. 119).

- Minimum thickness for shaft flange is 4.80 mm (0.189 in.)
- Minimum thickness for first gear bearing inner race flange is 3.99 mm (0.157 in.)

Measure diameter of the output shaft journal surfaces with a micrometer. Replace the shaft if either of these surfaces are worn beyond specified limits.

- Second gear surface minimum diameter is 37.964 mm (1.495 in.)
- Third gear surface minimum diameter is 34.984 mm (1.377 in.)

Measure diameter of the first gear bearing inner race. Minimum diameter is 38.985 mm (1.535 in.).

Measure output shaft runout with a dial indicator (Fig. 120). Runout should not exceed 0.05 mm (0.002 in.).

Replace output shaft or first gear inner bearing race if measurement of any surface is out of specification. Do not attempt to repair out of specification components.

CLEANING AND INSPECTION (Continued)

COUNTERSHAFT

Inspect the countershaft gear teeth. Replace the countershaft if any teeth are worn or damaged. Inspect the bearing surfaces and replace shaft if any surface shows damage or wear.

Check condition of the countershaft front bearing. Replace the bearing if worn, noisy, or damaged.

GEAR AND SYNCHRONIZER

Install the needle bearing and inner race in the first gear. Then check oil clearance between the gear and inner race (Fig. 121). Clearance should be 0.009 - 0.032 mm (0.0004 - 0.0013 in.).

J8921-46

Fig. 121 Check Gear-To-Race Clearance

- 1 - GEAR
2 - INNER RACE

Install the needle bearings and the second, third and counter fifth gears on the output shaft. Then check oil clearance between the gears and shaft with a dial indicator (Fig. 122). Oil clearance for all three gears is 0.009 - 0.0013 mm (0.0004 - 0.0013 in.).

Check synchronizer ring wear (Fig. 123). Insert each ring in matching gear. Measure clearance between each ring and gear with feeler gauge. Replace ring if clearance exceeds 2.0 mm (0.078 in.).

Check shift fork-to-synchronizer hub clearance with a feeler gauge (Fig. 124). Replace the fork if clearance exceeds 1.0 mm (0.039 in.).

(1) Inspect all mainshaft gear teeth. Replace any gear which shows any worn or damaged teeth.

GENERAL INFORMATION

NV3550 MANUAL TRANSMISSION

DESCRIPTION

The NV3550 is a medium-duty, 5-speed, constant mesh, fully synchronized manual transmission. Fifth gear is an overdrive range with a ratio of 0.78:1. The NV3550 is available in two and four-wheel drive configurations.

The transmission gear case consists of two aluminum housings. The clutch housing is a removable component. It is not an integral part of the transmission front housing.

A combination of roller and ball bearings are used to support the transmission shafts in the two housings. The transmission gears all rotate on caged type needle bearings. A roller bearing is used between the input and output shaft.

The NV3550 has a single shaft shift mechanism with three shift forks all mounted on the shaft. The shaft is supported in the front and rear housings by bushings and one linear ball bearing. Internal shift components consist of the forks, shaft, shift lever socket, and detent components (Fig. 1).

GEAR RATIOS

Gear ratios for the NV3550 are as follows:

RANGE	RATIO
FIRST	4.01:1
SECOND	2.32:1
THIRD =	1.40:1
FOURTH =	1:1
FIFTH =	0.78:1
REVERSE =	3.55:1

IDENTIFICATION

The NV3550 identification and part number bar code tags (Fig. 2) are located on the top of the transmission, forward of the shift tower.

OPERATION

The manual transmission receives power through the clutch assembly from the engine. The clutch disc is splined to the transmission input shaft and is turned at engine speed at all times that the clutch is engaged. The input shaft is connected to the transmission countershaft through the mesh of fourth speed gear on the input shaft and the fourth countershaft gear. At this point, all the transmission gears are spinning.

The driver selects a particular gear by moving the shift lever to the desired gear position. This movement moves the internal transmission shift components to begin the shift sequence. As the shift lever moves the selected shift rail, the shift fork attached to that rail begins to move. The fork is positioned in a groove in the outer circumference of the synchronizer sleeve. As the shift fork moves the synchronizer sleeve, the synchronizer begins to speed-up or slow down the selected gear (depending on whether we are up-shifting or down-shifting). The synchronizer does this by having the synchronizer hub splined to the mainshaft, or the countershaft in some cases, and moving the blocker ring into contact with the gear's friction cone. As the blocker ring and friction cone come together, the gear speed is brought up or down to the speed of the synchronizer. As the two speeds match, the splines on the inside of the synchronizer sleeve become aligned with the teeth on the blocker ring and the friction cone and eventually will slide over the teeth, locking the gear to the mainshaft, or countershaft, through the synchronizer.

LUBRICANT**DESCRIPTION**

Required lubricant for the NV3550 is Mopar® Manual Transmission Lubricant, P/N 4761526. This is the **only** lubricant to be used in NV3550 transmissions. No other lubricants are acceptable, or recommended.

The correct transmission lubricant level is to the bottom edge of the fill plug hole (Fig. 3).

The transmission must be level to obtain an accurate lubricant level check. A drive-on type of hoist is recommended for this purpose.

Lubricant capacity of the NV3500 is approximately 2.28 liters (4.8 pints). This represents the approximate quantity needed to refill the transmission after a lubricant change or overhaul.

DRAIN AND FILL PLUG LOCATIONS

The NV3550 fill plug is located in the front housing. The drain plug is at the bottom rear of the housing (Fig. 3).

GENERAL INFORMATION (Continued)

80c070f7

Fig. 3 Drain and Fill Plug Locations

DIAGNOSIS AND TESTING

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill, or an incorrect lubricant level check.

Leaks can occur at the mating surfaces of the housings, or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening, or use of a non-recommended sealer.

A leak at the front of the transmission will be from either a loose or damaged, front bearing retainer or retainer seal. Lubricant may also drip from the transmission clutch housing after extended operation. If the leak is severe, it will contaminate the clutch disc causing slip, grab and chatter.

Transmissions filled from air or electrically powered lubricant containers can be under filled. Always check the lubricant level after filling to avoid an under fill condition.

A correct lubricant level check can only be made when the vehicle is level; use a drive-on hoist to ensure this. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an under-or-overfill condition.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants, transmission component damage, clutch linkage malfunction, or by a damaged clutch pressure plate or disc.

Substantial lubricant leaks can result in gear, shift component, synchro and bearing damage. If a leak goes undetected for an extended period, the first indications of a problem are usually hard shifting and noise.

Incorrect or contaminated lubricants can also contribute to hard shifting. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind and hard shifting.

Improper clutch release is a frequent cause of hard shifting. Incorrect adjustment or a worn, damaged pressure plate or disc can cause incorrect release. If the clutch problem is advanced, gear clash during shifts can result.

Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing stiff and/or noisy shifts. In most cases, this condition will decline as the rings wear in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears can generate a mild whine that may only be audible at extreme speeds.

Severe, obviously audible transmission noise is generally the result of a lubricant problem. Insufficient, improper, or contaminated lubricant can promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear breakage.

REMOVAL AND INSTALLATION**TRANSMISSION****REMOVAL**

- (1) Shift transmission into first or third gear.
- (2) Remove the floor console and shift boot as necessary to access the bottom of the shift lever at the shift tower attachment.

REMOVAL AND INSTALLATION (Continued)

- (3) Install nuts on two M6X1.0 bolts and thread the bolts into the threaded holes at the base of the shift lever.
- (4) Tighten the nuts equally until the shift lever loosens on the shift tower stub shaft.
- (5) Remove the shift lever from the shift tower.
- (6) Raise and support vehicle on suitable safety stands.
- (7) Support engine with adjustable jack stand. Position wood block between jack and oil pan to avoid damaging pan.
- (8) Remove crossmember/skid plate.
- (9) Disconnect necessary exhaust system components.
- (10) Remove skid plate, if equipped.
- (11) Remove slave cylinder (Fig. 4) from clutch housing.

80be45f3

Fig. 4 Slave Cylinder

1 – CLUTCH SLAVE CYLINDER

- (12) Mark rear propeller shaft and rear axle yokes for installation alignment (Fig. 5).
- (13) Mark front propeller shaft, axle, and transfer case yokes for installation alignment, if equipped.
- (14) Remove propeller shaft(s).
- (15) Unclip wire harnesses from transmission and transfer case, if equipped.
- (16) Disconnect transfer case vent hose, if equipped.
- (17) Disengage any wire connectors attached to transmission or transfer case, if equipped, components.
- (18) Support transfer case, if equipped, with transmission jack.
- (19) Secure transfer case, if equipped, to jack with safety chains.

J9316-2

Fig. 5 Marking Propeller Shaft And Axle Yokes

1 – REFERENCE MARKS

- (20) Disconnect transfer case shift linkage at transfer case, if equipped.
- (21) Remove nuts attaching transfer case to transmission, if equipped.
- (22) Remove transfer case, if equipped.
- (23) Remove crankshaft position sensor (Fig. 6).

80a0c62e

Fig. 6 Crankshaft Position Sensor —2.5 and 4.0L Engine

- 1 – ENGINE SPEED SENSOR
- 2 – GROMMET
- 3 – MOUNTING BOLT(S)
- 4 – LEFT REAR OF ENGINE
- 5 – TRANSMISSION

CAUTION: It is important that the crankshaft position sensor be removed prior to transmission removal. The sensor can easily be damaged if left in place during removal operations.

REMOVAL AND INSTALLATION (Continued)

(24) Support engine with adjustable jack stand. Position wood block between jack and oil pan to avoid damaging pan.

(25) Support transmission with transmission jack.

(26) Secure transmission to jack with safety chains.

(27) Disconnect rear cushion and bracket from transmission.

(28) Remove rear crossmember.

(29) Remove clutch housing-to-engine bolts.

(30) Pull transmission jack rearward until input shaft clears clutch. Then slide transmission out from under vehicle.

(31) Remove clutch release bearing, release fork, and retainer clip.

(32) Remove clutch housing from transmission (Fig. 7).

80be4510

Fig. 7 Clutch Housing

1 - HOUSING-TO-TRANSMISSION BOLTS (46 N·m/34 ft. lbs.)

2 - CLUTCH HOUSING

3 - TRANSMISSION

INSTALLATION

(1) Install clutch housing (Fig. 7) on transmission. Tighten housing bolts to 46 N·m (34 ft. lbs.) torque.

(2) Lubricate contact surfaces of release fork pivot ball stud and release fork with high temp grease.

(3) Install release bearing, fork, and retainer clip.

(4) Position and secure transmission on transmission jack.

(5) Lightly lubricate pilot bearing and transmission input shaft splines with Mopar® high temp grease.

(6) Raise transmission and align transmission input shaft and clutch disc splines. Then slide transmission into place.

(7) Install and tighten clutch housing-to-engine bolts to the appropriate torque: **Be sure the housing is properly seated on engine block before tightening bolts.**

- Tighten 3/8" diameter bolts to 37 N·m (27 ft.lbs.).

- Tighten 7/16" diameter bolts to 58 N·m (43 ft.lbs.).

- Tighten M12 bolts to 75 N·m (55 ft.lbs.).

(8) Be sure transmission is in first or third gear.

(9) Install rear crossmember. Tighten crossmember-to-frame bolts to 41 N·m (31 ft. lbs.) torque.

(10) Install fasteners to hold rear cushion and bracket to transmission. Then tighten transmission-to-rear support bolts/nuts to 54 N·m (40 ft. lbs.) torque.

(11) Remove support stands from engine and transmission.

(12) Install and connect crankshaft position sensor.

(13) Position transfer case on transmission jack, if equipped.

(14) Secure transfer case to jack with safety chains, if equipped.

(15) Raise transfer case, if equipped, and align transfer case input shaft to the transmission output shaft.

(16) Slide transfer case forward until case is seated on transmission, if necessary.

(17) Install nuts to attach transfer case to transmission, if equipped. Tighten transfer case-to-transmission nuts to 35 N·m (26 ft. lbs.) torque.

(18) Connect transfer case shift linkage at transfer case, if equipped.

(19) Connect transfer case vent hose, if equipped.

(20) Secure wire harnesses in clips/tie straps on transmission and transfer case, if equipped.

(21) Engage wire connectors attached to all necessary transmission or transfer case, if equipped, components.

(22) Install rear propeller shaft slip yoke to transmission or transfer case, if equipped, output shaft.

(23) Align marks on rear propeller shaft and rear axle yokes (Fig. 8).

(24) Install and tighten propeller shaft U-joint clamp bolts to 19 N·m (170 in. lbs.) torque.

(25) Align marks on front propeller shaft, axle, and transfer case yokes, if equipped.

(26) Install and tighten propeller shaft U-joint clamp bolts to 19 N·m (170 in. lbs.) torque.

(27) Install slave cylinder in clutch housing.

REMOVAL AND INSTALLATION (Continued)

J9316-2

Fig. 8 Align Propeller Shaft And Rear Axle Yokes Alignment Marks

1 – REFERENCE MARKS

(28) Install skid plate, if equipped. Tighten bolts to 42 N·m (31 ft. lbs.) torque. Tighten stud nuts to 17 N·m (150 in. lbs.) torque.

(29) Fill transmission and transfer case, if equipped, with recommended lubricants. Refer to the Lubricant Recommendation sections of the appropriate component for correct fluid.

(30) Lower vehicle.

(31) Install nuts on two M6X1.0 bolts and thread the bolts into the threaded holes at the base of the shift lever.

(32) Tighten the nuts equally until the shift lever will slide over the shift tower stub shaft.

(33) Install the floor console and shift boot.

SHIFT TOWER

REMOVAL

(1) Shift transmission into Neutral.

(2) Unscrew and remove the shift lever extension from the shift

(3) Remove any floor console components necessary to access the transmission shift tower.

(4) Remove the bolts holding the shift tower to the isolator plate and transmission gear case.

(5) Remove the shift tower (Fig. 9) from the transmission.

INSTALLATION

(1) Shift transmission into third gear.

(2) Clean the mating surfaces of shift tower and transmission gear case with suitable wax and grease remover.

(3) Install the shift tower onto the transmission case. No sealant is necessary between the shift tower and transmission case.

80a726fb

Fig. 9 Remove Shift Tower

1 – SHIFT TOWER AND LEVER ASSEMBLY

2 – SHIFT SOCKET

3 – SEAL

(4) Install the bolts to hold the shift tower to the isolator plate and the transmission gear case. Tighten the shift tower bolts to 8.5 N·m (6.3 ft. lbs.).

(5) Install the shift lever extension and any floor console components previously removed.

YOKE SEAL—2WD

REMOVAL

(1) Raise vehicle.

(2) Mark propeller shaft and axle yoke for alignment reference.

(3) Disconnect and remove propeller shaft.

(4) Remove old seal with Seal Remover C-3985-B (Fig. 10) from transmission housing.

J9521-57

Fig. 10 Removing Transmission Housing Yoke Seal

1 – SPECIAL TOOL C-3985-B

2 – SEAL

INSTALLATION

(1) Place seal in position on transmission housing.

(2) Drive seal into transmission housing with Seal Installer C-3972-A (Fig. 11).

REMOVAL AND INSTALLATION (Continued)

(3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines.

(4) Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

80a7e2be

Fig. 11 Installing Transmission Housing Yoke Seal

DISASSEMBLY AND ASSEMBLY
TRANSMISSION

DISASSEMBLY

FRONT HOUSING

- (1) If necessary, temporarily reinstall shift lever assembly. Shift transmission into Neutral.
- (2) If lubricant was not drained out of transmission during removal, remove drain plug and drain lubricant into container at this time.
- (3) Inspect drain plug magnet for debris.
- (4) Remove backup light switch. Switch is located on passenger side of rear housing (Fig. 14).

J9421-133

Fig. 14 Backup Light Switch Location

- 1 - BACKUP LIGHT SWITCH

- (5) If necessary, remove shift tower bolts and remove tower and lever assembly (Fig. 15).
- (6) Remove shift shaft lock bolt (Fig. 16). Bolt is located at top of front housing just forward of shift tower. Bolt is a shoulder bolt that secures the shift shaft bushing and lever.
- (7) Use Remover 8117 and suitable slide hammer to remove shift shaft detent plug.

**Fig. 18 Input Shaft Bearing Retainer Bolt Removal—Typical**

- 1 - INPUT SHAFT BEARING RETAINER
- 2 - RETAINER BOLTS

(8) Remove shift shaft detent plunger and spring (Fig. 17). Use pencil magnet to remove spring then plunger, if necessary.

(9) Remove bolts attaching input shaft bearing retainer to front housing (Fig. 18).

DISASSEMBLY AND ASSEMBLY (Continued)

(10) Remove input shaft bearing retainer. Use pry tool to carefully lift retainer and break sealer bead (Fig. 19).

Fig. 19 Loosening Bearing Retainer Sealer Bead—Typical

- 1 - PRY TOOL
- 2 - INPUT SHAFT BEARING RETAINER

(11) Remove bearing retainer from input shaft (Fig. 20).

Fig. 20 Input Shaft Bearing Retainer Removal—Typical

- 1 - SHAFT BEARING
- 2 - BEARING RETAINER
- 3 - INPUT SHAFT

(12) Remove snap ring that secures input shaft in front bearing (Fig. 21).

(13) Remove bolts that attach front housing to rear housing (Fig. 22). Three bolts at extreme rear of housing are actually for the output shaft bearing retainer. It is not necessary to remove all three bolts at this time. Leave at least one bolt in place until geartrain is ready to be removed from case.

SHIFT SHAFT, SHIFT FORKS AND REVERSE IDLER SEGMENT

(1) Unseat the roll pin that secures the shift socket to the shift shaft with Special Tool 6858 as follows:

(a) Position Tool 6858 on the shift shaft. Center the tool over the roll pin and verify that the tool legs are firmly seated on the shift socket (Fig. 26).

(b) Tilt the socket toward the side of the case. This positions the roll pin at a slight angle to avoid trapping the pin between the gear teeth.

(c) Tighten the tool punch to press the roll pin downward and out of the shift socket (Fig. 26). The roll pin does not have to be completely removed from the shift socket. The roll pin must only be clear of the shift shaft. Be careful not to push the pin into the geartrain.

(2) Using a hammer and suitable punch, drive out roll pin that secures shift bushing and lever to shift shaft (Fig. 27).

NOTE: Be sure to use the proper size punch to avoid bending the shift shaft.

DISASSEMBLY AND ASSEMBLY (Continued)

(8) Loosen rear reverse idler shaft bolt (rear bolt) (Fig. 32).

**Fig. 32 Reverse Idler Shaft/Support Bolts**

- 1 - SUPPORT BOLT
 2 - SHAFT BOLT

(9) Remove reverse idler shaft support segment by sliding it straight out of housing.

(10) Support geartrain and rear housing on Assembly Fixture Tool 6747 as follows:

(a) Adjust height of reverse idler pedestal rod until the reverse idle shaft bottoms in Cup 8115.

(b) Position Adapters 6747-1A and 6747-2A on Assembly Fixture 6747.

(c) Slide fixture tool onto input shaft, countershaft and idler gear (Fig. 33).

(d) Stand geartrain and rear housing upright on fixture (Fig. 34). Have helper hold fixture tool in housing.

place while housing and geartrain is being rotated into upright position.

(11) Remove rear bolt holding reverse idler shaft in housing.

DISASSEMBLY AND ASSEMBLY (Continued)

REAR HOUSING REMOVAL—2WD

(1) On 2-wheel drive transmission, remove three bolts that attach output shaft bearing retainer to rear case (Fig. 35). Bolts are rear of shift tower opening.

J9421-50

Fig. 35 Removing/Installing Output Shaft Bearing Retainer Bolts—2WD

1 - OUTPUT SHAFT BEARING RETAINER BOLTS (THIRD BOLT IS AT OPPOSITE SIDE OF CASE)

(2) Unseat output shaft bearing from bearing bore in rear housing. Use plastic or rawhide mallet to tap rear housing upward and off output shaft bearing as shown (Fig. 36).

(3) Lift rear housing up and off geartrain (Fig. 37).

(4) Remove countershaft rear bearing from countershaft (Fig. 38).

(5) Examine condition of bearing bore and idler shaft notch in rear housing. Replace housing if any of these components are damaged.

J9421-49

Fig. 36 Unseating Rear Housing From Output Shaft Bearing—2WD

1 - REAR HOUSING
2 - PLASTIC OR RAWHIDE Mallet
3 - FIXTURE TOOL

REAR ADAPTER HOUSING REMOVAL—4WD

(1) Locate dimples in face of rear seal (Fig. 39). Use a suitable slide hammer mounted screw to remove seal by inserting screw into seal at dimple locations (Fig. 40).

DISASSEMBLY AND ASSEMBLY (Continued)

- 4 - COUNTERSHAFT REAR BEARING RACE
- 5 - REAR BEARING

**Fig. 42 Rear Adapter Housing Removal**

- 1 - REAR ADAPTER HOUSING
- 2 - OUTPUT SHAFT

(4) Remove bearing retainer bolts and remove rear bearing retainer and rear bearing (Fig. 43). Use hammer handle to push or tap bearing out of housing if needed.

(5) Examine condition of bearing bore, countershaft rear bearing race and idler shaft notch in rear housing. Replace housing if race, bore or notch are worn or damaged.

GEARTRAIN DISASSEMBLY FROM FIXTURE

(1) Remove reverse idler gear assembly from assembly fixture cup.

(2) Remove 1-2 and fifth-reverse forks from synchro sleeves.

(3) Slide countershaft out of fixture tool.

(4) Remove output shaft bearing retainer from rear surface of fifth gear (retainer will drop onto gear after bolts are removed).

(5) Lift and remove output shaft and gears off input shaft.

(6) Lift and remove input shaft, pilot bearing and fourth gear synchro ring from assembly fixture tool.

DISASSEMBLY AND ASSEMBLY (Continued)

OUTPUT SHAFT

NOTE: The synchronizer hubs and sleeves are different and must not be intermixed. It is recommended that each synchronizer unit be removed as an assembly to avoid intermixing parts. It is also recommended that each synchro hub and sleeve be marked with a scribe or paint for correct assembly reference.

(1) Remove snap ring that secures 3-4 synchro hub on output shaft.

(2) Remove 3-4 synchro assembly, third gear synchro ring, and third gear with shop press and Remover Tool 1130. Position Tool 1130 between second and third gears.

(3) Remove third gear needle bearing (Fig. 44).

80a9b3b7

Fig. 44 Third Gear Needle Bearing Removal

1 - THIRD GEAR NEEDLE BEARING

(4) Remove retaining ring that secures two-piece thrust washer on shaft (Fig. 45). Use small pry tool to remove retaining ring.

J9421-23

Fig. 45 Thrust Washer Retaining Ring Removal

1 - PRY TOOL

2 - THRUST WASHER RETAINING RING

REVERSE IDLER DISASSEMBLY

- (1) Remove idler gear snap rings (Fig. 57).
- (2) Remove thrust washer, wave washer, thrust plate and idler gear from shaft.
- (3) Remove idler gear needle bearing from shaft.

ASSEMBLY

Gaskets are not used in the NV3550 transmission. Sealers are used at all case joints. Recommended sealers are Mopar® Gasket Maker for all case joints and Mopar® silicone sealer, or equivalent, for the input shaft bearing retainer. Apply these products as indicated in the assembly procedures.

NOTE: It is very important that the transmission shift components be in Neutral position during assembly. This is necessary to prevent damaging synchro and shift components when the housings are installed.

The 3-4, 1-2 and fifth-reverse synchro hub snap rings can be fitted selectively. New snap rings are available in 0.05 mm (0.0019 in.) thickness increments. Use the thickest snap ring that will fit in each snap ring groove.

SYNCHRONIZER

The easiest method of assembling each synchro is to install the springs, struts and detent balls one at a time as follows:

- (1) Slide the sleeve part way onto the hub. Leave enough room to install the spring in the hub and the strut in the hub groove.
- (2) Install the first spring in the hub. Then install a strut over the spring. Be sure the spring is seated in the spring bore in the strut.
- (3) Slide the sleeve onto the hub just far enough to hold the first strut and spring in place.
- (4) Place the detent ball in the top of the strut. Then carefully work the sleeve over the ball to hold it in place. A small flat blade screwdriver can be used to press the ball into place while moving the sleeve over it.
- (5) Repeat the procedure for the remaining springs, struts and balls. Tape, or a rubber band can be used to temporarily secure each strut and ball as they are installed.
- (6) Verify synchro assembly. Be sure the three springs, struts and detent balls are all in place (Fig. 58).

DISASSEMBLY AND ASSEMBLY (Continued)

- 6 - HUB

OUTPUT SHAFT

(1) Lubricate shaft, gears and bearings with recommended lubricant during assembly. Petroleum jelly can be used to hold parts in place.

(2) Check bearing surfaces of output shaft for nicks or scratches. Smooth surfaces with 320/400 grit emery cloth if necessary. Apply oil to emery cloth and shaft surface before polishing.

(3) Inspect and replace any synchro ring that exhibits wear or damage. Completely immerse each synchro ring in lubricant before installation.

(4) Lubricate and install reverse gear needle bearing on shaft (Fig. 59). Slide bearing up against shoulder on output shaft.

(5) Install reverse gear over needle bearing (Fig. 60).

(6) Install solid brass synchro ring on reverse gear (Fig. 61).

DISASSEMBLY AND ASSEMBLY (Continued)

(7) Assemble fifth-reverse synchro hub, sleeve, struts, springs and detent balls, if not previously done.

CAUTION: The fifth-reverse synchro hub and sleeve can be installed backwards if care is not exercised. One side of the hub has shoulders around the hub bore. Make sure this side of the hub is facing the front of the shaft. In addition, one side of the sleeve is tapered. Be sure the sleeve is installed so the tapered side will be facing the front of the shaft.

(8) Start fifth-reverse synchro assembly on output shaft splines by hand. Then seat synchro onto shaft with shop press and Remover 6310-1 (Fig. 62).

80a9b3bb

- 7 - OUTPUT SHAFT

(9) Install new fifth-reverse hub snap ring (Fig. 63) as follows:

(a) Snap rings are available in thicknesses from 2.00 mm to 2.20 mm (0.078 to 0.086 in.).

(b) Install thickest snap ring that will fit in shaft groove.

(c) Verify that snap ring is completely seated in groove before proceeding.

J9421-62

- 5 - PRESS RAM

(20) Install interm ring.

(21) Install new 1-2 synchro hub snap ring (Fig. 72) as follows:

(a) Snap rings are available in thicknesses from 1.80 mm to 2.00 mm (0.070 to 0.078 in.).

(b) Install thickest snap ring that will fit in shaft groove.

(c) Verify that snap ring is completely seated in groove before proceeding.

(22) Install second gear synchro ring in 1-2 synchro hub and sleeve (Fig. 73). Be sure synchro ring is properly seated in sleeve.

Fig. 80 Installing Third Gear

1 - THIRD GEAR
2 - BEARING

(31) Install third speed synchro ring on third gear (Fig. 81).

(32) Assemble 3-4 synchro hub, sleeve, springs, struts and detent balls.

CAUTION: The 3-4 synchro hub and sleeve can be installed backwards if care is not exercised. One side of the sleeve has grooves in it. Be sure this side of sleeve is also facing the front of the shaft.

Fig. 81 Third Speed Synchro Ring Installation

1 - THIRD SPEED SYNCHRO RING
2 - THIRD GEAR

(33) Start 3-4 synchro hub on output shaft splines by hand (Fig. 82).

Fig. 82 Starting 3-4 Synchro Hub On Output Shaft

1 - GROOVED SIDE OF SLEEVE (TO FRONT)
2 - 3-4 SYNCHRO ASSEMBLY

(34) Press 3-4 synchro assembly onto output shaft with shop press and suitable size pipe tool (Fig. 83). Make sure that the tool presses on hub as close to output shaft as possible but does not contact the shaft splines.

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 83 Pressing 3-4 Synchro Assembly On Output Shaft

- 1 - PRESS RAM
- 2 - PIPE TOOL
- 3 - 3-4 SYNCHRO
- 4 - THIRD SPEED SYNCHRO RING

(35) Install 3-4 synchro hub snap ring (Fig. 84) as follows:

(a) Snap rings are available in thicknesses from 2.00 mm to 2.30 mm (0.078 to 0.090 in.).

(b) Install thickest snap ring that will fit in shaft groove. Use heavy duty snap ring pliers to install new ring.

(c) Verify that snap ring is completely seated in groove before proceeding.

Fig. 84 Installing 3-4 Synchro Hub Snap Ring

- 1 - 3-4 SYNCHRO HUB SNAP RING
- 2 - HEAVY DUTY SNAP RING PLIERS

(36) Install output shaft bearing.

(37) Install output shaft bearing snap ring (Fig. 85). Use heavy duty snap ring pliers and spread snap ring only enough to install it. Be sure snap ring is completely seated in shaft groove before proceeding.

Fig. 85 Installing Output Shaft Bearing Snap Ring

- 1 - BEARING SNAP RING
- 2 - HEAVY DUTY SNAP RING PLIERS

(38) Verify correct position of synchro sleeves before proceeding with assembly operations (Fig. 86). Grooved side of 3-4 sleeve should be facing forward. First gear side of 1-2 sleeve should be facing first gear. Tapered side of fifth-reverse sleeve should be facing forward.

REVERSE IDLER ASSEMBLY

(1) Lubricate idler components with gear lube.

(2) Slide idler gear bearing on shaft (Fig. 87). Bearing fits either way on shaft.

(3) Slide gear onto shaft. Side of gear with recess goes to rear (Fig. 87).

(4) Place first lock ball in dimple at rear end of idler shaft (Fig. 87). Petroleum jelly can be used to hold ball in place if desired.

(5) Slide thrust rear thrust washer onto shaft and over lock ball (Fig. 88).

(6) Install snap ring in groove at rear of shaft (Fig. 88).

(7) Install lock ball in dimple at front of shaft. Hold ball in place with petroleum jelly if desired.

- 8 - SNAP RING

SHIFT SHAFT AND DETENT PLUNGER BUSHINGS/BEARINGS

(1) Inspect shift shaft bushing and bearing for damage.

(2) If necessary, the shift shaft bushing can be replaced as follows:

(a) Locate a bolt that will thread into the bushing without great effort.

(b) Thread the bolt into the bushing, allowing the bolt to make its own threads in the bushing.

(c) Attach a slide hammer or suitable puller to the bolt and remove bushing.

(d) Use the short end of Installer 8119 to install the new bushing.

(e) The bushing is correctly installed if the bushing is flush with the transmission case.

(3) If necessary, the shift shaft bearing can be replaced as follows:

(a) Locate a bolt that will thread into the bearing without great effort.

(b) Thread the bolt into the bearing as much as possible.

(c) Attach a slide hammer or suitable puller to the bolt and remove the bearing.

(d) Use the short end of Installer 8119 to install the new bearing.

(e) The bearing is correctly installed if the bearing is flush with the transmission case.

(4) Inspect detent plunger bushings for damage.

NOTE: The detent plunger bushings are installed to a specific depth. The space between the two bushings when correctly installed contain an oil feed hole. Do not attempt to install the bushings with anything other than the specified tool or this oil hole may become restricted.

(5) If necessary, the detent plunger bushings can be replaced as follows:

(a) Using the long end of Installer 8119, drive the detent bushings through the outer case and into the shift shaft bore.

(b) Remove the bushings from the shift shaft bore.

(c) Install a new detent plunger bushing on the long end of Installer 8118.

(d) Start the bushing in the detent plunger bore in the case.

(e) Drive the bushing into the bore until the tool contacts the transmission case.

(f) Install a new detent plunger bushing on the short end of Installer 8118.

(g) Start the bushing in the detent plunger bore in the case.

(h) Drive the bushing into the bore until the tool contacts the transmission case.

GEARTRAIN ASSEMBLY

(1) Install Adapter 6747-1A on input shaft hub of fixture tool (Fig. 90). Then install Adapter 6747-2A on front bearing hub of countershaft. Adapter 6747-2A has a raised shoulder on one side. Be sure the shoulder is seated against the countershaft.

(2) Install input shaft in fixture tool. Make sure Adapter Tool 6747-1A is positioned under shaft as shown (Fig. 91).

(3) Install pilot bearing in input shaft (Fig. 91).

NOTE: There is a correct and an incorrect way to install the pilot bearing into the input shaft. The side of the pilot bearing with the small diameter goes toward the input shaft.

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 90 Preparing Assembly Fixture For Geartrain Build-up

- 1 - SPECIAL TOOL 6747-2A (INSTALL ON COUNTERSHAFT FRONT HUB)

- 3 - SPECIAL TOOL 6747-1A
- 4 - SPECIAL TOOL 6747

Fig. 91 Installing Pilot Bearing In Input Shaft

- 1 - PILOT BEARING
- 2 - INPUT SHAFT

(4) Install fourth gear synchro ring on input shaft (Fig. 92).

Fig. 92 Installing Fourth Gear Synchro Ring On Input Shaft

- 1 - FOURTH GEAR SYNCHRO RING
- 2 - INPUT SHAFT

(5) Adjust height of idler gear pedestal on assembly fixture (Fig. 93). Start with a basic height of 18.4 cm (7-1/4 in.). Final adjustment can be made after gear is positioned on pedestal.

Fig. 93 Idler Pedestal Basic Height Adjustment

- 1 - REVERSE IDLER PEDESTAL

(6) Install assembled output shaft and geartrain in input shaft (Fig. 94). Carefully rotate output shaft until the 3-4 synchro ring seats in synchro hub and sleeve.

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 94 Output Shaft And Geartrain Installed In Input Shaft

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - INPUT SHAFT
- 3 - SPECIAL TOOL 6747

(7) Install Adapter 6747-2A on front bearing hub of countershaft, if not previously done. The adapter has a shoulder on one side. The shoulder goes toward the countershaft.

(8) Slide countershaft (and adapter) into fixture slot. Verify that countershaft and output shaft gears are fully meshed with the mainshaft gears before proceeding (Fig. 95).

(9) Check alignment of countershaft and output shaft gear teeth. Note that gears may not align perfectly. A difference in height of 1.57 to 3.18 mm (1/16 to 1/8 in.) will probably exist. This difference will not interfere with assembly. However, if the difference is greater than this, the countershaft adapter tool is probably upside down. Remove countershaft, reverse adapter tool, reinstall countershaft and check alignment again.

Fig. 95 Countershaft Installed On Fixture Tool

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - COUNTERSHAFT (SLIDE INTO PLACE ON FIXTURE TOOL)

DISASSEMBLY AND ASSEMBLY (Continued)

(10) Position reverse idler in support cup of assembly fixture (Fig. 96). Be sure idler gear is properly meshed and aligned with shaft gear teeth and that bolt holes are facing out and not toward geartrain. Adjust pedestal up or down if necessary. Also be sure that short end of idler shaft is facing up as shown.

Fig. 96 Reverse Idler Assembly Positioned On Assembly Fixture Pedestal

- 1 - OUTPUT SHAFT AND GEARTRAIN
- 2 - COUNTERSHAFT
- 3 - REVERSE IDLER ASSEMBLY
- 4 - TOOL PEDESTAL

(11) On 2-wheel drive transmission, thread one Pilot Stud 8120 in center or passenger side hole of output shaft bearing retainer. Then position retainer on fifth gear as shown (Fig. 97).

(12) Assemble 1-2 and fifth reverse-shift forks (Fig. 98). Arm of fifth-reverse fork goes through slot in 1-2 fork.

Fig. 97 Positioning Output Shaft Bearing Retainer For Rear Housing Installation

- 2 - 1-2 FORK
- 3 - FIFTH-REVERSE FORK

DISASSEMBLY AND ASSEMBLY (Continued)

(13) Install assembled shift forks in synchro sleeves (Fig. 99). Be sure forks are properly seated in sleeves.

Fig. 99 Shift Forks Installed In Synchro Sleeves

- 1 - SYNCHRO SLEEVES
- 2 - FORK ARMS
- 3 - SHIFT FORKS

REAR HOUSING—2WD

(1) Drive adapter housing alignment dowels back into housing until dowels are flush with mounting surface (Fig. 100).

Fig. 100 Preparing Rear Housing Dowels For Installation

- 1 - HOUSING ALIGNMENT DOWELS
- 2 - REAR HOUSING
- 3 - DOWEL FLUSH WITH SURFACE

(2) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(3) Install countershaft rear bearing in bearing race (Fig. 101).

CAUTION: The countershaft bearings can be installed backwards if care is not exercised. Be sure the large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 102).

(4) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(5) Apply light coat of petroleum jelly to shift shaft bushing/bearing in rear housing (Fig. 102).

(6) Reach into countershaft rear bearing with finger, and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place. This avoids having rollers becoming displaced during housing installation. This will result in misalignment between bearing and countershaft bearing hub.

J9421-103

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 102 Countershaft Rear Bearing Seated In Seated in Race

- 1 - SHIFT SHAFT BUSHING/BEARING
2 - COUNTERSHAFT REAR BEARING (SEATED IN RACE)

(7) Install rear housing onto geartrain (Fig. 103). Be sure bearing retainer pilot stud is in correct bolt hole in housing. Also be sure countershaft and output shaft bearings are aligned in housing and on countershaft. It may be necessary to lift upward on countershaft slightly to ensure that the countershaft rear bearing engages to the countershaft before the rear output shaft bearing engages the housing.

Fig. 103 Rear Housing Installation—2WD

- 1 - REAR HOUSING
2 - SHIFT FORKS AND GEARTRAIN

(8) Seat rear housing on output shaft rear bearing and countershaft. Use plastic or rawhide mallet to tap housing into place.

(9) Install the three bolts that secure rear bearing retainer to rear housing as follows:

(a) Apply Mopar® Gasket Maker, or equivalent, to bolt threads, bolt shanks and under bolt heads (Fig. 104).

(b) Start first two bolts in retainer (Fig. 105). It may be necessary to move retainer rearward (with pilot stud) in order to start bolts in retainer.

(c) Remove Pilot Stud 8120 and install last retainer bolt (Fig. 105).

(d) Tighten all three retainer bolts to 30-35 N·m (22-26 ft. lbs.) torque.

Fig. 104 Applying Sealer To Retainer And Housing Bolts

- 4 - COUNTERSHAFT REAR BEARING RACE
- 5 - REAR BEARING

(3) Apply Mopar® Gasket Maker, or equivalent, to threads, bolt shanks and under hex heads of bearing retainer bolts (Fig. 107).

(4) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(5) Install countershaft rear bearing in bearing race (Fig. 102).

CAUTION: The countershaft bearings can be installed backwards if care is not exercised. Be sure the large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 102).

(6) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(7) Apply light coat of petroleum jelly to shift shaft bushing/bearing in adapter housing (Fig. 102).

(8) Install adapter housing on geartrain.

(9) Install rear bearing snap ring on output shaft (Fig. 107).

J9421-201

Fig. 107 Installing Rear Bearing Snap Ring—4WD

- 1 - HEAVY DUTY SNAP RING PLIERS
- 2 - REAR BEARING SNAP RING
- 3 - OUTPUT SHAFT

(10) Lubricate lip of new rear seal (Fig. 108) with Mopar® Door Ease, or transmission fluid.

(11) Install new rear seal in adapter housing bore with Installer C-3860-A. Be sure seal is fully seated in housing bore (Fig. 108).

J9421-204

Fig. 108 Rear Seal Installation—4WD

- 1 - REAR SEAL
- 2 - SEAL LIP

SHIFT SHAFT, SHAFT LEVER AND BUSHING AND SHIFT SOCKET

(1) Before proceeding, verify that all synchro sleeves are in Neutral position (centered on hub). Move sleeves into neutral if necessary.

DISASSEMBLY AND ASSEMBLY (Continued)

CAUTION: The transmission synchros must all be in Neutral position for proper reassembly. Otherwise, the housings, shift forks and gears can be damaged during installation of the two housings.

(2) Install 3-4 shift fork in synchro sleeve (Fig. 109). Verify that groove in fork arm is aligned with grooves in 1-2 and fifth-reverse fork arms as shown.

Fig. 109 Installing 3-4 Shift Fork

- 1 - 3-4 FORK
- 2 - ALIGN GROOVES IN FORK ARMS

(3) Slide shift shaft through 3-4 shift fork (Fig. 110). Be sure shaft detent notches are to front.

Fig. 110 Shift Shaft Installation

- 1 - SHIFT SHAFT
- 2 - 3-4 FORK
- 3 - SHAFT DETENT NOTCHES

(4) Assemble shift shaft shift lever and bushing (Fig. 111). Be sure slot in bushing is facing up and roll pin hole for lever is aligned with hole in shaft.

Fig. 111 Assembling Shift Shaft Lever And Bushing

- 1 - SHAFT LEVER
- 2 - LEVER BUSHING
- 3 - BUSHING LOCK PIN SLOT

(5) Install assembled lever and bushing on shift shaft (Fig. 112).

Fig. 112 Installing Shift Shaft Lever And Bushing

- 1 - SHIFT SHAFT
- 2 - SHAFT LEVER AND BUSHING
- 3 - 3-4 FORK

(6) Slide shift shaft through 1-2 and fifth-reverse fork and into shift lever opening in rear housing (Fig. 113).

(7) Align shift socket with shaft and slide shaft through socket and into shift shaft bearing in rear housing (Fig. 114).

(8) Rotate shift shaft so detent notches in shaft are facing the TOP of the transmission housing.

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 113 Inserting Shaft Into Lever Opening In Housing

1 - SHIFT SHAFT

Fig. 114 Shift Socket Installation

1 - SHIFT SOCKET
2 - SHIFT SHAFT

CAUTION: Correct positioning of the shift shaft detent notch is important. Both of the shaft roll pins can be installed even when the shaft is 180° off. If this occurs, the transmission will have to be disassembled again to correct shaft alignment.

(9) Select correct new roll pin for shift shaft lever (Fig. 115). Shaft lever roll pin is approximately 22 mm (7/8 in.) long. Shift socket roll pin is approximately 33 mm (1-1/4 in.) long.

J9421-86

Fig. 115 Roll Pin Identification—Shaft Lever And Shift Socket

1 - SHAFT LEVER ROLL PIN
2 - SHIFT SOCKET ROLL PIN

(10) Align roll pin holes in shift shaft, lever and bushing. Then start roll pin into shaft lever by hand (Fig. 116).

J9421-113

Fig. 116 Starting Roll Pin In Shift Shaft Lever

1 - SHAFT LEVER ROLL PIN (7/8" LONG)
2 - LEVER AND BUSHING

(11) Seat shaft lever roll pin with pin punch (Fig. 117).

CAUTION: The shaft lever roll pin must be flush with the surface of the lever. The lever bushing will bind on the roll pin if the pin is not seated flush.

(12) Before proceeding, verify that lock pin slot in lever bushing is positioned as shown (Fig. 117).

(13) Align roll pin holes in shift socket and shift shaft. Then start roll pin into shift shaft by hand (Fig. 118).

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 117 Correct Seating Of Shift Shaft Lever Roll Pin

- 1 - BUSHING LOCK PIN SLOT
2 - SEAT ROLL PIN FLUSH WITH LEVER

Fig. 119 Seating Shift Socket Roll Pin

- 1 - PIN PUNCH
2 - SHIFT SOCKET
3 - SEAT ROLL PIN FLUSH
4 - SHIFT SOCKET

Fig. 118 Starting Roll Pin In Shift Socket

- 1 - ROLL PIN
2 - SHIFT SOCKET
3 - SHIFT SHAFT

(14) Seat roll pin in shift socket with pin punch. Roll pin must be flush with socket after installation (Fig. 119).

(15) Verify that notches in shift fork arms are aligned. Realign arms if necessary.

FRONT HOUSING AND INPUT SHAFT BEARING RETAINER

(1) If previously removed, install input shaft bearing in front housing bore (Fig. 120). Install snap ring and use plastic mallet to seat bearing. Bearing goes in from front side of housing only.

Fig. 120 Input Shaft Bearing And Countershaft Front Bearing

- 1 - INPUT SHAFT BEARING
2 - COUNTERSHAFT FRONT BEARING
3 - SHIFT SHAFT BUSHING

DISASSEMBLY AND ASSEMBLY (Continued)

(2) Apply liberal quantity of petroleum jelly to countershaft front bearing. Then insert bearing in front housing race (Fig. 120). Large diameter side of bearing cage goes toward countershaft (Fig. 121). Small diameter side goes toward bearing race in housing.

(3) Reach into countershaft front bearing with finger, and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place. This avoids having rollers becoming displaced during housing installation. This will result in misalignment between bearing and countershaft bearing hub.

J9421-121

Fig. 121 Lubricating/Positioning Countershaft Front Bearing

- 1 - BEARING RACE
- 2 - PETROLEUM JELLY
- 3 - COUNTERSHAFT FRONT BEARING

(4) Apply small amount of petroleum jelly to shift shaft bushing in front housing.

(5) Apply 1/8 in. wide bead of Mopar® Gasket Maker, or equivalent, to mating surfaces of front and rear housings (Fig. 122).

(6) Have helper hold rear housing and geartrain in upright position. Then install front housing on rear housing and geartrain.

(7) Work front housing downward onto geartrain until seated on rear housing.

CAUTION: If the front housing will not seat on the rear housing, either the shift components are not in Neutral, or one or more components are misaligned. Do not force the front housing into place. This will only result in damaged components.

(8) Tap rear housing alignment dowels back into place with hammer and pin punch. Both dowels should be flush fit in each housing. Have helper hold

J9421-123

Fig. 122 Applying Sealer To Front/Rear Housings

- 1 - HOUSING FLANGE SURFACE
- 2 - MOPAR GASKET MAKER (OR LOCTITE 518)

transmission upright while dowels are tapped back into place.

(9) Place transmission in horizontal position.

(10) Apply Mopar® Gasket Maker, or equivalent, to housing attaching bolts. Apply sealer material sealer to underside of bolt heads and to bolt shanks and threads (Fig. 123).

(11) Install and start housing attaching bolts by hand (Fig. 123). Then tighten bolts to 34 N·m (25 ft. lbs.) torque.

J9521-156

Fig. 123 Installing Housing Attaching Bolts

- 1 - HOUSING ATTACHING BOLTS (APPLY SEALER BEFOREHAND)

DISASSEMBLY AND ASSEMBLY (Continued)

(12) Install shift shaft bushing lock bolt (Fig. 124). Apply Mopar® Gasket Maker, or equivalent, to bolt threads, shank and underside of bolt head before installation.

CAUTION: If the lock bolt cannot be fully installed, do not try to force it into place. Either the shift shaft is not in Neutral, or the shaft bushing (or lever) is misaligned.

Fig. 124 Installing Shift Shaft Bushing Lock Bolt

- 1 - SHIFT SHAFT LOCK BOLT
2 - SHAFT SOCKET

(13) Lubricate then install shift shaft detent plunger in housing bore (Fig. 125). Lubricate plunger with petroleum jelly or gear lubricant. **Be sure plunger is fully seated in detent notch in shift shaft.**

Fig. 125 Installing Shift Shaft Detent Plunger, Spring, and Plug

- 1 - FRONT HOUSING
2 - PLUG
3 - SPRING
4 - PLUNGER

(14) Install detent spring inside plunger (Fig. 125).

(15) Install detent plug as follows:

(a) Install detent plug in end of Installer 8123.

(b) Position plug on detent spring and compress spring until detent plug pilots in detent plunger bore.

(c) Drive detent plug into transmission case until plug seats.

(16) Install backup light switch (Fig. 126).

Fig. 126 Installing Backup Light Switch

- 1 - BACKUP LIGHT SWITCH

(17) Install input shaft snap ring (Fig. 127).

Fig. 127 Installing Input Shaft Snap Ring—Typical

- 1 - INPUT SHAFT SNAP RING

(18) Install new oil seal in front bearing retainer with Installer Tool 6448 (Fig. 128).

(19) Apply bead of Mopar® silicone sealer, or equivalent, to flange surface of front bearing retainer (Fig. 129).

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 128 Installing Oil Seal In Front Bearing Retainer**

- 1 - SPECIAL TOOL
6448
2 - FRONT BEARING RETAINER

**Fig. 130 Installing Input Shaft Bearing Retainer—Typical**

- 1 - INPUT SHAFT
2 - OIL FEED
3 - BEARING RETAINER

**Fig. 129 Applying Sealer To Bearing Retainer And Housing—Typical**

- 1 - APPLY SEALER BEAD
2 - INPUT SHAFT BEARING RETAINER

(20) Align and install front bearing retainer over input shaft and onto housing mounting surface (Fig. 130). Although retainer is one-way fit on housing, be sure bolt holes are aligned before seating retainer.

NOTE: Be sure that no sealer gets into the oil feed hole in the transmission case or bearing retainer.

(21) Install and tighten bearing retainer bolts to 7-10 N·m (5-7 ft. lbs.) torque (Fig. 131).

**Fig. 131 Installing Input Shaft Bearing Retainer Bolts—Typical**

- 1 - INPUT SHAFT BEARING RETAINER
2 - RETAINER BOLTS

SHIFT TOWER AND LEVER ASSEMBLY

(1) Apply petroleum jelly to ball end of shift lever and interior of shift socket.

(2) Shift the transmission into third gear.

(3) Align and install shift tower and lever assembly (Fig. 132). Be sure shift ball is seated in socket and the offset in the tower is toward the passenger side of the vehicle before installing tower bolts.

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Install shift tower bolts (Fig. 133). Tighten bolts to 8.5 N·m (75.2 in. lbs.) torque.

Fig. 132 Shift Tower Installation

- 1 - SHIFT TOWER AND LEVER ASSEMBLY
- 2 - SHIFT SOCKET
- 3 - SEAL

Fig. 133 Shift Tower Bolt Installation

- 1 - SHIFT TOWER AND LEVER ASSEMBLY

(5) Fill transmission to bottom edge of fill plug hole with Mopar® Transmission Lubricant, P/N 4761526.

(6) Install and tighten fill plug to 34 N·m (25 ft. lbs.) torque.

(7) Check transmission vent. Be sure vent is open and not restricted.

CLEANING AND INSPECTION

TRANSMISSION COMPONENTS

Clean the gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

Clean the shaft bearings with a mild solvent such as Mopar® degreasing solvent, Gunk, or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry, or wipe them dry with clean shop towels.

SHIFT LEVER ASSEMBLY

The shift lever assembly is not serviceable. Replace the lever and shift tower as an assembly if the tower, lever, lever ball, or internal components are worn, or damaged.

SHIFT SHAFT AND FORKS

Inspect the shift fork interlock arms and synchro sleeve contact surfaces (Fig. 134). Replace any fork exhibiting wear or damage in these areas. Do not attempt to salvage shift forks.

Check condition of the shift shaft detent plunger and spring. The plunger should be smooth and free of nicks, or scores. The plunger spring should be straight and not collapsed, or distorted. Minor scratches, or nicks on the plunger can be smoothed with 320/400 grit emery soaked in oil. Replace the plunger and spring if in doubt about condition. Check condition of detent plunger bushings. Replace if damaged.

Inspect the shift shaft, shift shaft bushing and bearing, the shaft lever, and the lever bushing that fits over the lever. Replace the shaft if bent, cracked, or severely scored. Minor burrs, nicks, or scratches can be smoothed off with 320/400 grit emery cloth followed by polishing with crocus cloth. Replace the shift shaft bushing or bearing if damaged.

Replace the shaft lever and bushing if either part is deformed, or worn. Do not attempt to salvage these parts as shift fork binding will occur. Replace the roll pin that secures the lever to the shaft.

FRONT/REAR HOUSINGS AND BEARING RETAINERS

Inspect the housings carefully. Look for cracks, stripped threads, scored mating surfaces, damaged bearing bores, or worn dowel pin holes. Minor nicks on mating surfaces can be dressed off with a fine file, or emery cloth. Damaged threads can be renewed by either re-tapping or installing Helicoil inserts.

CLEANING AND INSPECTION (Continued)

80c070ff

Fig. 134 Shift Forks And Shaft

- 1 - SHIFT SHAFT
- 2 - SHAFT LEVER
- 3 - SHAFT LEVER BUSHING

- 4 - 3-4 SHIFT FORK
- 5 - 1-2 SHIFT FORK
- 6 - FIFTH-REVERSE SHIFT FORK

NOTE: The front housing contains the countershaft front bearing race. The rear housing contains the countershaft rear bearing race. Be advised that these components are NOT serviceable items. The front housing will have to be replaced if the countershaft bearing race is loose, worn, or damaged. The rear housing will have to be replaced if the countershaft rear bearing race is loose, worn, or damaged.

Inspect the input shaft bearing retainer. Be sure the release bearing slide surface of the retainer is in good condition. Minor nicks on the surface can be smoothed off with 320/420 grit emery cloth and final polished with oil coated crocus cloth. Replace the retainer seal if necessary.

Inspect the output shaft bearing retainer. Be sure the U-shaped retainer is flat and free of distortion. Replace the retainer if the threads are damaged, or if the retainer is bent, or cracked.

COUNTERSHAFT BEARINGS AND RACES

The countershaft bearings and races are machine lapped during manufacture to form matched sets. The bearings and races should not be interchanged.

NOTE: The bearing races are a permanent press fit in the housings and are NOT serviceable. If a bear-

ing race becomes damaged, it will be necessary to replace the front or rear housing as necessary. A new countershaft bearing will be supplied with each new housing for service use.

The countershaft bearings can be installed backwards if care is not exercised. The bearing roller cage is a different diameter on each side. Be sure the bearing is installed so the large diameter side of the cage is facing the countershaft gear (Fig. 135). The small diameter side goes in the bearing race.

REVERSE IDLER COMPONENTS

Inspect the idler gear, bearing, shaft, thrust washer, wave washer and thrust plate. Replace the bearing if any of the needle bearing rollers are worn, chipped, cracked, flat-spotted, or brinnelled. Also replace the bearing if the plastic bearing cage is damaged or distorted.

Replace the thrust washer, wave washer, or thrust plate if cracked, chipped, or worn. Replace the idler gear if the teeth are chipped, cracked or worn thin. Replace the shaft if worn, scored, or the bolt threads are damaged beyond repair. Replace the support segment if cracked, or chipped and replace the idler attaching bolts if the threads are damaged.

CLEANING AND INSPECTION (Continued)

J9421-55

Fig. 135 Correct Countershaft Bearing Installation

1 - COUNTERSHAFT
2 - BEARING CAGE

Shift Socket

Inspect the shift socket for wear or damage. replace the socket if the roll pin, or shift shaft bores are damaged. Minor nicks in the shift lever ball seat in the socket can be smoothed down with 400 grit emery or wet/dry paper. Replace the socket if the ball seat is worn, or cracked. Do not reuse the original shift socket roll pin. Install a new pin during reassembly. The socket roll pin is approximately is approximately 33 mm (1-1/4 in.) long.

Output Shaft And Geartrain

Inspect all of the gears for worn, cracked, chipped, or broken teeth. Also check condition of the bearing bore in each gear. The bores should be smooth and free of surface damage. Discoloration of the gear bores is a normal occurrence and is not a reason for replacement. Replace gears only when tooth damage has occurred, or if the bores are brinnelled or severely scored.

Inspect the shaft splines and bearings surfaces. Minor nicks on the bearing surfaces can be smoothed with 320/420 grit emery and final polished with crocus cloth. Replace the shaft if the splines are damaged or bearing surfaces are deeply scored, worn, or brinnelled.

SPECIFICATIONS

DESCRIPTION AND OPERATION

30RH AUTOMATIC TRANSMISSION

DESCRIPTION

The 30RH automatic transmission is used with the 2.5L engine (Fig. 1). The 30RH is three speed transmissions with a lock-up clutch in the torque converter. The transmissions contain a front and rear clutch which function as the input driving components. They also contain the kickdown (front) and the low/reverse (rear) bands which, along with the over-running clutch, serve as the holding components. The driving and holding components combine to select the necessary planetary gear components, in the front and rear planetary gear set, transfer the engine power from the input shaft through to the output shaft. The transmissions contain a governor that is mounted on the output shaft and supplies pressure to the valve body based on the output shaft speed. The valve body is mounted to the lower side of the transmission and contains the valves to control pressure regulation, fluid flow control, and clutch/band application. The oil pump is mounted at the front of the transmission and is driven by the torque converter hub. The pump supplies the oil pressure necessary for clutch/band actuation and transmission lubrication. The 30RH transmission is cooled by an integral fluid cooler inside the radiator.

TRANSMISSION GEAR RATIOS

Forward gear ratios are:

- 2.74:1 (first gear)
- 1.54:1 (second gear)
- 1.00:1 (third gear)

OPERATION

The application of each driving or holding component is controlled by the valve body based upon the manual lever position and governor pressure. The governor pressure is a variable pressure input to the valve body and is one of the signals that a shift is necessary. First through third gear are obtained by selectively applying and releasing the different clutches and bands. Engine power is thereby routed to the various planetary gear assemblies which combine with the overrunning clutch assembly to generate the different gear ratios. The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch engages in third gear when the vehicle is cruising on a level plane after the vehicle has warmed up. The torque converter clutch will disengage momentarily when an increase in engine load is sensed by the PCM, such as when the vehicle begins to go uphill or the throttle pressure is increased. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature.

DESCRIPTION AND OPERATION (Continued)

PARK POWERFLOW

As the engine is running and the crankshaft is rotating, the flexplate and torque converter, which are also bolted to it, are all rotating in a clockwise direction as viewed from the front of the engine. The notched hub of the torque converter is connected to the oil pump's internal gear, supplying the transmission with oil pressure. As the converter turns, it turns the input shaft in a clockwise direction. As the input shaft is rotating, the front clutch hub-rear clutch retainer and all their associated parts are also rotating, all being directly connected to the input shaft. The power flow from the engine through the front-clutch-hub and rear-clutch-retainer stops at the rear-clutch-retainer. Therefore, no power flow to the output shaft, occurs because no clutches are applied. The only mechanism in use at this time is the parking sprag (Fig. 3), which locks the parking gear on the output shaft to the transmission case.

80c070a6

Fig. 3 Park Powerflow

- 1 - LEVER ENGAGED FOR PARK
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT

NEUTRAL POWERFLOW

With the gear selector in the neutral position (Fig. 4), the power flow of the transmission is essentially the same as in the park position. The only operational difference is that the parking sprag has been disengaged, unlocking the output shaft from the transmission case and allowing it to move freely.

80c070a7

Fig. 4 Neutral Powerflow

- 1 - LEVER DISENGAGED FOR NEUTRAL
- 2 - PARK SPRAG
- 3 - OUTPUT SHAFT
- 4 - CAM
- 5 - LEVER

DESCRIPTION AND OPERATION (Continued)

REVERSE POWERFLOW

When the gear selector is moved into the reverse position (Fig. 5), the front clutch and the rear band are applied. With the application of the front clutch, engine torque is applied to the sun gear, turning it in a clockwise direction. The clockwise rotation of the sun gear causes the rear planet pinions to rotate against engine rotation in a counterclockwise direction. The rear band is holding the low reverse drum, which is splined to the rear carrier. Since the rear carrier is being held, the torque from the planet pinions is transferred to the rear annulus gear, which is splined to the output shaft. The output shaft in turn rotates with the annulus gear in a counterclockwise direction giving a reverse gear output. The entire transmission of torque is applied to the rear planetary gearset only. Although there is torque input to the front gearset through the sun gear, no other member of the gearset is being held. During the entire reverse stage of operation, the front planetary gears are in an idling condition.

80c070a8

Fig. 5 Reverse Powerflow

DESCRIPTION AND OPERATION (Continued)

FIRST GEAR POWERFLOW

When the gearshift lever is moved into the drive position the transmission goes into first gear (Fig. 6). As soon as the transmission is shifted from park or neutral to drive, the rear clutch applies, applying the rear clutch pack to the front annulus gear. Engine torque is now applied to the front annulus gear turning it in a clockwise direction. With the front annulus gear turning in a clockwise direction, it causes the front planets to turn in a clockwise direction. The rotation of the front planets cause the sun to revolve in a counterclockwise direction. The sun gear now transfers its counterclockwise rotation to the rear planets which rotate back in a clockwise direction. With the rear annulus gear stationary, the rear planet rotation on the annulus gear causes the rear planet carrier to revolve in a counterclockwise direction. The rear planet carrier is splined into the low-reverse drum, and the low reverse drum is splined to the inner race of the over-running clutch. With the over-running clutch locked, the planet carrier is held, and the resulting torque provided by the planet pinions is transferred to the rear annulus gear. The rear annulus gear is splined to the output shaft and rotated along with it (clockwise) in an underdrive gear reduction mode.

80c070a9

Fig. 6 First Gear Powerflow

DESCRIPTION AND OPERATION (Continued)

SECOND GEAR POWERFLOW

In drive-second (Fig. 7), the same elements are applied as in manual-second. Therefore, the power flow will be the same, and both gears will be discussed as one in the same. In drive-second, the transmission has proceeded from first gear to its shift point, and is shifting from first gear to second. The second gear shift is obtained by keeping the rear clutch applied and applying the front (kickdown) band. The front band holds the front clutch retainer that is locked to the sun gear driving shell. With the rear clutch still applied, the input is still on the front annulus gear turning it clockwise at engine speed. Now that the front band is holding the sun gear stationary, the annulus rotation causes the front planets to rotate in a clockwise direction. The front carrier is then also made to rotate in a clockwise direction but at a reduced speed. This will transmit the torque to the output shaft, which is directly connected to the front planet carrier. The rear planetary annulus gear will also be turning because it is directly splined to the output shaft. All power flow has occurred in the front planetary gear set during the drive-second stage of operation, and now the over-running clutch, in the rear of the transmission, is disengaged and freewheeling on its hub.

DESCRIPTION AND OPERATION (Continued)

DIRECT DRIVE POWERFLOW

The vehicle has accelerated and reached the shift point for the 2–3 upshift into direct drive (Fig. 8). When the shift takes place, the front band is released, and the front clutch is applied. The rear clutch stays applied as it has been in all the forward gears. With the front clutch now applied, engine torque is now on the front clutch retainer, which is locked to the sun gear driving shell. This means that the sun gear is now turning in engine rotation (clockwise) and at engine speed. The rear clutch is still applied so engine torque is also still on the front annulus gear. If two members of the same planetary set are driven, direct drive results. Therefore, when two members are rotating at the same speed and in the same direction, it is the same as being locked up. The rear planetary set is also locked up, given the sun gear is still the input, and the rear annulus gear must turn with the output shaft. Both gears are turning in the same direction and at the same speed. The front and rear planet pinions do not turn at all in direct drive. The only rotation is the input from the engine to the connected parts, which are acting as one common unit, to the output shaft.

FLUID

NOTE: Refer to the maintenance schedules in Group 0, Lubrication and Maintenance for the recommended maintenance (fluid/filter change) intervals for this transmission.

NOTE: Refer to Service Procedures in this group for fluid level checking procedures.

DESCRIPTION

Mopar® ATF Plus 3, Type 7176, automatic transmission fluid is the recommended fluid for Daimler-Chrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® ATF Plus 3, Type 7176, automatic transmission fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of

DESCRIPTION AND OPERATION (Continued)

fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** A dark brown/black fluid accompanied with a burnt odor and/or deterioration in shift quality may indicate fluid deterioration or transmission component failure.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

OPERATION

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 9) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third gear. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the fluid cooler and lines.

DESCRIPTION AND OPERATION (Continued)

IMPELLER

The impeller (Fig. 10) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving member of the system.

TURBINE

The turbine (Fig. 11) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

The stator assembly (Fig. 12) is mounted on a stationary shaft which is an integral part of the oil pump. The stator is located between the impeller and turbine within the torque converter case (Fig. 13). The stator contains an over-running clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

- 5 - TURBINE
- 6 - FRICTION DISC

80bfe26f

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 14) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the front cover to provide this mechanical lock-up.

OPERATION

The converter impeller (Fig. 15) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the

impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft (Fig. 16). Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counter-clockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the

stator is freewheeling, providing no torque multiplication. By applying the turbine's piston to the front cover's friction material, a total converter engagement can be obtained. The result of this engagement

is a direct 1:1 mechanical link between the engine and the transmission.

The engagement and disengagement of the TCC are automatic and controlled by the Powertrain Control Module (PCM). The engagement cannot be activated in the lower gears because it eliminates the torque multiplication effect of the torque converter necessary for acceleration. Inputs that determine clutch engagement are: coolant temperature, vehicle speed and throttle position. The torque converter clutch is engaged by the clutch solenoid on the valve body. The clutch will engage at approximately 56 km/h (35 mph) with light throttle, after the shift to third gear.

OIL PUMP

DESCRIPTION

The oil pump (Fig. 17) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear, a housing, and a cover that also serves as the reaction shaft support.

DESCRIPTION AND OPERATION (Continued)

80be45f7

Fig. 17 Oil Pump Assembly

- 1 – OIL SEAL
- 2 – OIL PUMP BODY
- 3 – VENT
- 4 – REACTION SHAFT SUPPORT
- 5 – INNER ROTOR
- 6 – OUTER ROTOR
- 7 – “O” RING

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

VALVE BODY**DESCRIPTION**

The valve body consists of a cast aluminum valve body, a separator plate, and transfer plate. The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, bands, and frictional clutches. The valve body contains the following components (Fig. 18) and (Fig. 19):

- Regulator valve
- Regulator valve throttle pressure plug
- Line pressure plug and sleeve
- Kickdown valve
- Kickdown limit valve
- 1-2 shift valve
- 1-2 control valve
- 2-3 shift valve
- 2-3 governor plug
- Throttle valve
- Throttle pressure plug
- Switch valve
- Manual valve
- Converter clutch control valve
- Fail-safe valve
- Shuttle valve
- Shuttle valve throttle plug
- 9 check balls

By adjusting the spring pressure acting on the regulator valve, transmission line pressure can be adjusted.

OPERATION

NOTE: Refer to the Hydraulic Schematics for a visual aid in determining valve location, operation and design.

REGULATOR VALVE

The pressure regulator valve is needed to control the hydraulic pressure within the system and reduce the amount of heat produced in the fluid. The pressure regulator valve is located in the valve body near the manual valve. The pressure regulator valve train controls the maximum pressure in the lines by metering the dumping of fluid back into the sump. Regulated pressure is referred to as "line pressure."

The regulator valve (Fig. 20) has a spring on one end that pushes the valve to the left. This closes a dump (vent) that is used to lower pressure. The closing of the dump will cause the oil pressure to increase. Oil pressure on the opposite end of the valve pushes the valve to the right, opening the dump and lowering oil pressure. The result is spring pressure working against oil pressure to maintain

the oil at specific pressures. With the engine running, fluid flows from the pump to the pressure regulator valve, manual valve, and the interconnected circuits. As fluid is sent through passages to the regulator valve, the pressure pushes the valve to the right against the large spring. It is also sent to the reaction areas on the left side of the throttle pressure plug and the line pressure plug. With the gear selector in the park position, fluid recirculates through the regulator and manual valves back to the sump.

DESCRIPTION AND OPERATION (Continued)

Meanwhile, the torque converter is filled slowly. In all other gear positions (Fig. 21), fluid flows between two right side lands to the switch valve and torque converter. At low pump speeds, the flow is controlled by the pressure valve groove to reduce pressure to the torque converter. After the torque converter and switch valve fill with fluid, the switch valve becomes the controlling metering device for torque converter pressure. The regulator valve then begins to control the line pressure for the other transmission circuits. The balance of the fluid pressure pushing the valve to the right and the spring pressure pushing to the left determines the size of the metering passage at land #2 (land #1 being at the far right of the valve in the diagram). As fluid leaks past the land, it moves into a groove connected to the filter or sump. As the land meters the fluid to the sump, it causes the pressure to reduce and the spring decreases the size of the metering passage. When the size of the metering passage is reduced, the pressure rises again and the size of the land is increased again. Pressure is regulated by this constant balance of hydraulic and spring pressure.

Fig. 21 Regulator Valve in Neutral Position

- 1 - MANUAL VALVE
- 2 - TO SHIFT VALVE
- 3 - FROM THROTTLE VALVE

- 4 - REGULATOR VALVE
- 5 - THROTTLE PRESSURE PLUG

The metering at land #2 establishes the line pressure throughout the transmission. It is varied according to changes in throttle position, engine speed, and transmission condition within a range of 57–94 psi (except in reverse) (Fig. 22). The regulated line pressure in reverse (Fig. 23) is held at much higher pressures than in the other gear positions: 145–280 psi. The higher pressure for reverse is achieved by the manual valve blocking the supply of line pressure to the reaction area left of land #4. With this pressure blocked, there is less area for pressure to act on to balance the force of the spring on the right. This allows line pressure to push the valve train to the right, reducing the amount of fluid returned to the pump's inlet, increasing line pressure.

| 5 - MAXIMUM THROTTLE PRESSURE | |

KICKDOWN VALVE

When the throttle valve is as far over to the left as it can go, the maximum line pressure possible will enter the throttle pressure circuit. In this case, throttle pressure will equal line pressure. With the kickdown valve (Fig. 24) pushed into the bore as far as it will go, fluid initially flows through the annular groove of the 2-3 shift valve (which will be in the direct drive position to the right).

After passing the annular groove, the fluid is routed to the spring end of the 2-3 shift valve. Fluid pressure reacting on the area of land #1 overcomes governor pressure, downshifting the 2-3 shift valve into the kickdown, or second gear stage of operation. The valve is held in the kickdown position by throttle pressure routed from a seated check ball (#2). Again, if vehicle speed is low enough, throttle pressure will also push the 1-2 shift valve left to seat its governor plug, and downshift to drive breakaway.

KICKDOWN LIMIT VALVE

The purpose of the limit valve is to prevent a 3-2 downshift at higher speeds when a part-throttle downshift is not desirable. At these higher speeds only a full throttle 3-2 downshift will occur. At low road speeds (Fig. 25) the limit valve does not come into play and does not affect the downshifts. As the vehicle's speed increases (Fig. 26), the governor pressure also increases. The increased governor pressure acts on the reaction area of the bottom land of the limit valve overcoming the spring force trying to push the valve toward the bottom of its bore. This pushes the valve upward against the spring and bottoms the valve against the top of the housing. With the valve bottomed against the top of the housing, the throttle pressure supplied to the valve will be closed off by the bottom land of the limit valve. When the supply of throttle pressure has been shut off, the 3-2 part throttle downshift plug becomes inoperative, because no pressure is acting on its reaction area.

3 - LINE PRESSURE
4 - LINE PRESSURE PASSAGE FOR MANUAL LOW POSITION

1-2 SHIFT VALVE

The 1-2 shift valve assembly (Fig. 27), or mechanism, consists of: the 1-2 shift valve, governor plug, and a spring on the end of the valve. After the manual valve has been placed into a forward gear range, line pressure is directed to the 1-2 shift valve. As the throttle is depressed, throttle pressure is applied to the right side of the 1-2 shift valve assembly. With throttle pressure applied to the right side of the valve, there is now both spring pressure and throttle pressure acting on the valve, holding it against the governor plug. As the vehicle begins to move and build speed, governor pressure is created and is applied to the left of the valve at the governor plug.

DESCRIPTION AND OPERATION (Continued)

80be4612

Fig. 28 1-2 Shift Valve-After Shift

1 - TO FRONT SERVO AND 2-3 SHIFT VALVE
2 - THROTTLE PRESSURE

3 - LINE PRESSURE

4 - LINE PRESSURE PASSAGE FOR MANUAL LOW POSITION

When governor pressure builds to a point where it can overcome the combined force of the spring and throttle pressure on the other side of the valve, the valve will begin to move over to the right. As the valve moves to the right, the middle land of the valve will close off the circuit supplying the throttle pressure to the right side of the valve. When the throttle pressure is closed off, the valve will move even farther to the right, allowing line pressure to enter another circuit and energize the front servo, applying the front band (Fig. 28).

The governor plug serves a dual purpose: [0001]

- It allows the shift valves to move either left or right, allowing both upshifts and downshifts.
- When in a manual selection position, it will be hydraulically “blocked” into position so no upshift can occur.

The physical blocking of the upshift while in the manual “1” position is accomplished by the directing of line pressure between both lands of the governor plug. The line pressure reacts against the larger land of the plug, pushing the plug back against the end

plate overcoming governor pressure. With the combination of the line pressure and spring pressure, the valve cannot move, preventing any upshift.

1-2 SHIFT CONTROL VALVE

It contains a valve with four lands and a spring. It is used as both a “relay” and “balanced” valve.

The valve has two specific operations (Fig. 29):

- Aid in quality of the 1-2 upshift.
- Aid in the quality and timing of the 3-2 kick-down ranges.

When the manual valve is set to the Drive position and the transmission is in the first or second gear range, 1-2 shift control or “modulated throttle pressure” is supplied to the middle of the accumulator piston by the 1-2 shift control valve. During the 1-2 upshift, this pressure is used to control the kickdown servo apply pressure that is needed to apply the kickdown and accumulator pistons. Thus, the 1-2 shift point is “cushioned” and the quality is improved. During a WOT kickdown, kickdown pressure is applied between the kickdown valve and the 1-2

DESCRIPTION AND OPERATION (Continued)

shift control valve. This additional pressure is directed to the 1-2 shift control's spring cavity, adding to the spring load on the valve. The result of this increased "modulated" throttle pressure is a firmer WOT upshift.

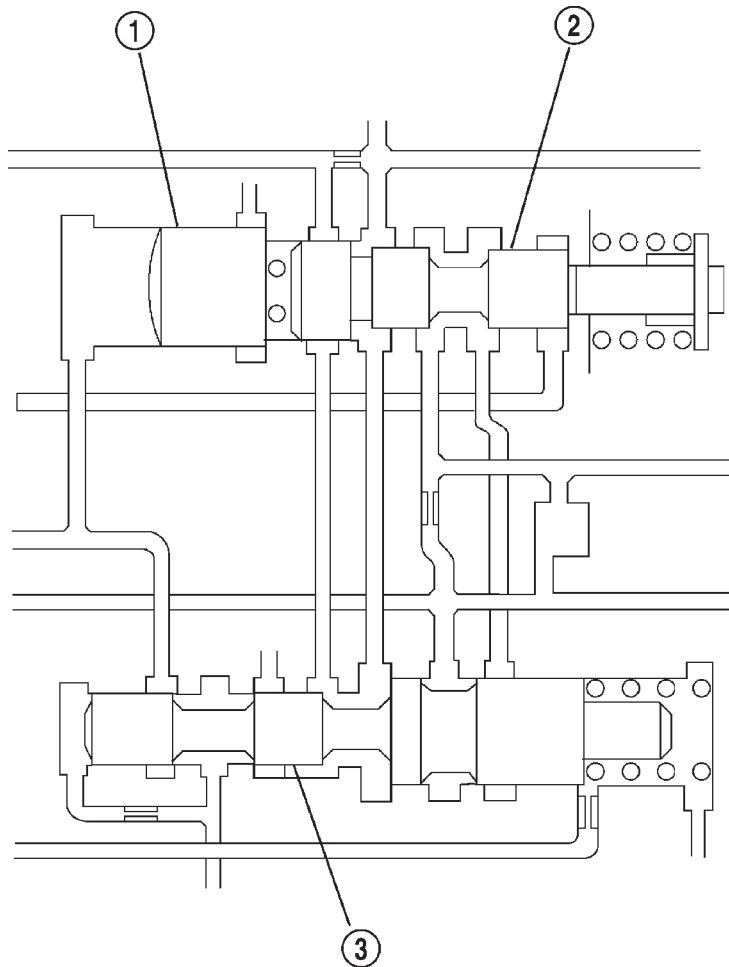

SHUTTLE VALVE

The assembly is contained in a bore in the valve body above the shift valves. When the manual valve is positioned in the Drive range, throttle pressure acts on the throttle plug of the shuttle valve (Fig. 29) to move it against a spring, increasing the spring force on the shuttle valve. During a part or full throttle 1-2 upshift, the throttle plug is bottomed by throttle pressure, holding the shuttle valve to the right against governor pressure, and opening a by-pass circuit. The shuttle valve controls the quality of the kickdown shift by restricting the rate of

fluid discharge from the front clutch and servo release circuits. During a 3-2 kickdown, fluid discharges through the shuttle by-pass circuit. When the shuttle valve closes the by-pass circuit, fluid discharge is restricted and controlled for the application of the front band. During a 2-3 "lift foot" upshift, the shuttle valve by-passes the restriction to allow full fluid flow through the by-pass groove for a faster release of the band.

2-3 SHIFT VALVE

The 2-3 shift valve mechanism (Fig. 30) consists of the 2-3 shift valve, governor plug and spring, and a throttle plug. After the 1-2 shift valve has completed its operation and applied the front band, line pressure is directed to the 2-3 shift valve through the connecting passages from the 1-2 shift valve. The line pressure will then dead-end at land #2 until the

80be4613

Fig. 29 1-2 Shift Control Valve

1 - THROTTLE PLUG

2 - SHUTTLE VALVE

3 - 1-2 SHIFT CONTROL VALVE

DESCRIPTION AND OPERATION (Continued)

2-3 valve is ready to make its shift. Now that the vehicle is in motion and under acceleration, there is throttle pressure being applied to the spring side of the valve and between lands #3 and #4.

As vehicle speed increases, governor pressure increases proportionately, until it becomes great enough to overcome the combined throttle and spring pressure on the right side of the valve. When this happens, the governor plug is forced against the shift valve moving it to the right. The shift valve causes land #4 to close the passage supplying throttle pressure to the 2-3 shift valve. Without throttle pressure present in the circuit now, the governor plug will push the valve over far enough to bottom the valve in its bore. This allows land #2 to direct line pressure to the front clutch.

After the shift (Fig. 31), line pressure is directed to the land between the shift valve and the governor plug, and to the release side of the kickdown servo. This releases the front band and applies the front clutch, shifting into third gear or direct drive. The rear clutch remains applied, as it has been in the other gears. During a manual "1" or manual "2" gear selection, line pressure is sent between the two lands

of the 2-3 governor plug. This line pressure at the governor plug locks the shift valve into the second gear position, preventing an upshift into direct drive. The theory for the blocking of the valve is the same as that of the 1-2 shift valve.

THROTTLE VALVE

In all gear positions the throttle valve (Fig. 32) is being supplied with line pressure. The throttle valve meters and reduces the line pressure that now becomes throttle pressure. The throttle valve is moved by a spring and the kickdown valve, which is mechanically connected to the throttle. The larger the throttle opening, the higher the throttle pressure (to a maximum of line pressure). The smaller the throttle opening, the lower the throttle pressure (to a minimum of zero at idle). As engine speed increases, the increase in pump speed increases pump output. The increase in pressure and volume must be regulated to maintain the balance within the transmission. To do this, throttle pressure is routed to the reaction area on the right side of the throttle pressure plug (in the regulator valve).

DESCRIPTION AND OPERATION (Continued)

AFTER SHIFT

Fig. 31 2-3 Shift Valve-After Shift

80bfe262

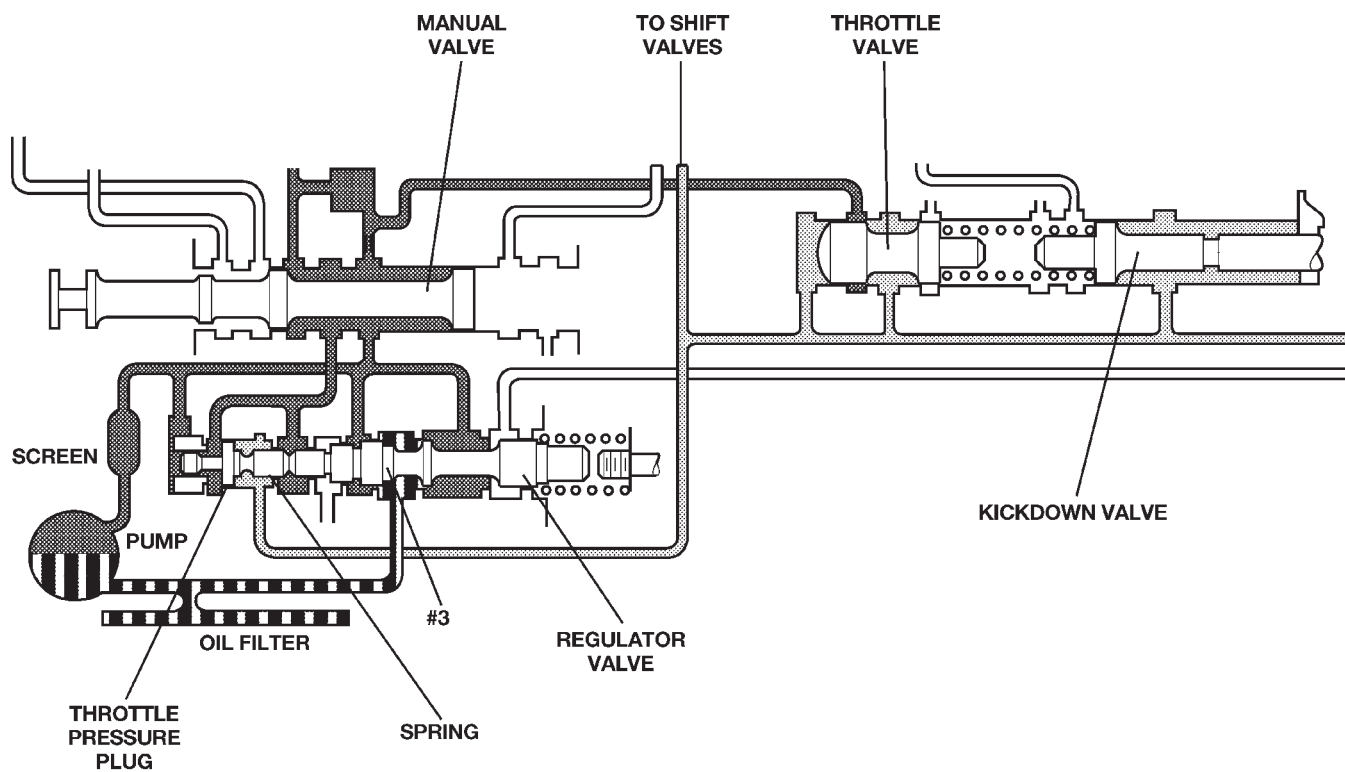

Fig. 32 Throttle Valve

80bfe263

DESCRIPTION AND OPERATION (Continued)

The higher engine speed and line pressure would open the vent too far and reduce line pressure too much. Throttle pressure, which increases with engine speed (throttle opening), is used to oppose the movement of the pressure valve to help control the metering passage at the vent. The throttle pressure is combined with spring pressure to reduce the force of the throttle pressure plug on the pressure valve. The larger spring at the right closes the regulator valve passage and maintains or increases line pressure. The increased line pressure works against the reaction area of the line pressure plug and the reaction area left of land #3 simultaneously moves the regulator valve train to the right and controls the metering passage.

The kickdown valve, along with the throttle valve, serve to delay upshifts until the correct vehicle and engine speed have been reached. It also controls downshifts upon driver demand, or increased engine load. If these valves were not in place, the shift points would be at the same speed for all throttle positions. The kickdown valve is actuated by a cam connected to the throttle. This is accomplished through either a linkage or a cable. The cam forces the kickdown valve toward the throttle valve compressing the spring between them and moving the throttle valve. As the throttle valve land starts to uncover its port, line pressure is "metered" out into the circuits and viewed as throttle pressure. This increased throttle pressure is metered out into the circuits it is applied to: the 1-2 and 2-3 shift valves. When the throttle pressure is high enough, a 3-2 downshift will occur. If the vehicle speed is low enough, a 2-1 downshift will occur.

SWITCH VALVE

When the transmission is in Drive Second just before the TCC application occurs (Fig. 33), the pressure regulator valve is supplying torque converter

pressure to the switch valve. The switch valve directs this pressure through the transmission input shaft, into the converter, through the converter, back out between the input shaft and the reaction shaft, and back up to the switch valve. From the switch valve, the fluid pressure is directed to the transmission cooler, and lubrication pressure returns from the cooler to lubricate different portions of the transmission.

Once the TCC control valve has moved to the left (Fig. 34), line pressure is directed to the fail-safe valve, and then to the tip of the switch valve, forcing the valve downward. The switch valve now vents oil from the front of the piston in the torque converter, and supplies line pressure to the (rear) apply side of the torque converter piston. This pressure differential causes the piston to apply against the friction material, cutting off any further flow of line pressure oil. After the switch valve is shuttled downward allowing line pressure to engage the TCC, torque converter pressure is directed past the switch valve into the transmission cooler and lubrication circuits.

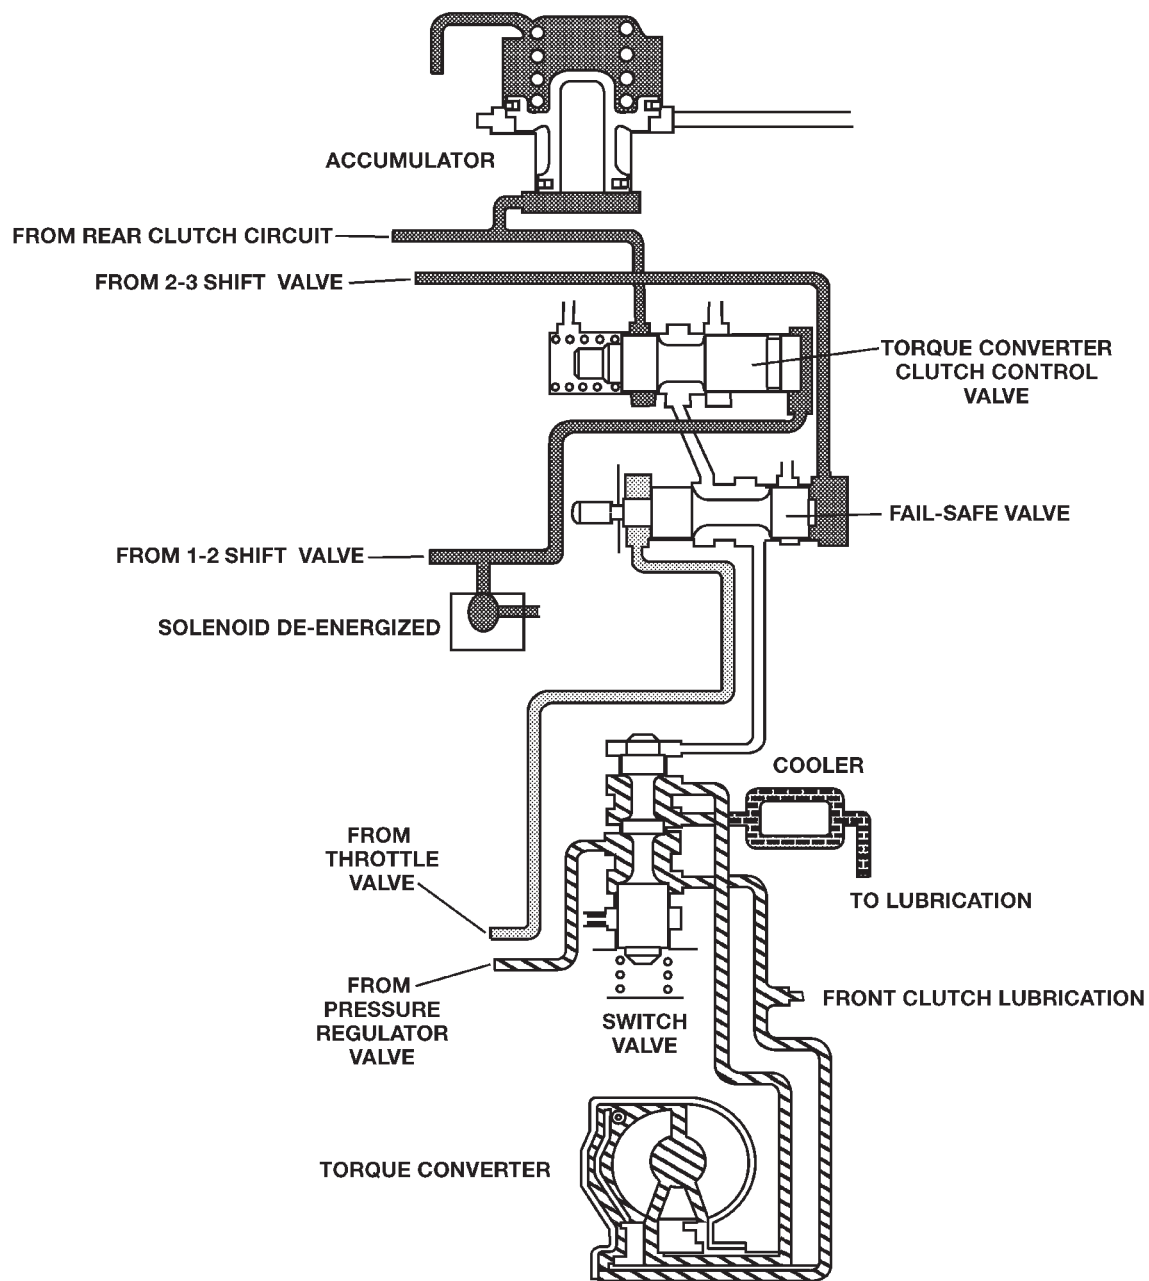

CONVERTER CLUTCH CONTROL VALVE

The torque converter clutch (TCC) control valve controls the back (ON) side of the torque converter clutch. When the PCM energizes the TCC solenoid to engage the converter clutch piston, pressure is applied to the TCC control valve which moves to the left and applies pressure to the fail-safe valve.

FAIL-SAFE VALVE

The pressure coming from the TCC control valve dead-ends at the fail-safe valve until governor pressure on the right side of the valve increases. The pressure must be high enough to overcome the throttle and spring pressure on the left side of the valve and push the valve to the left. The pressure will then flow to the switch valve.

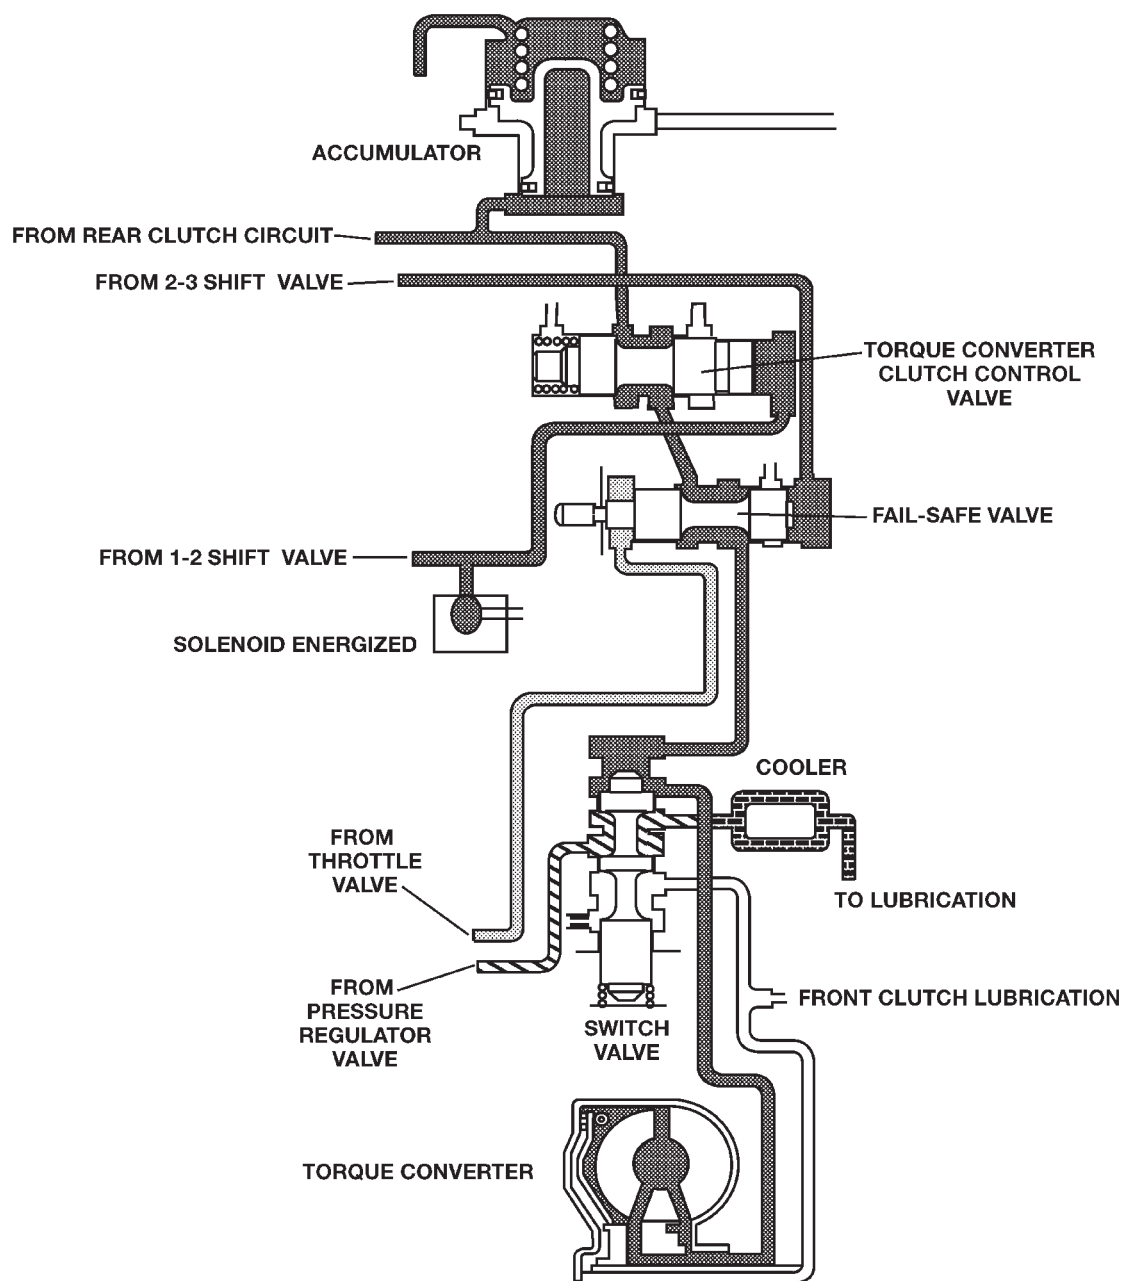

DESCRIPTION AND OPERATION (Continued)

MANUAL VALVE

The manual valve (Fig. 35) is a relay valve. The purpose of the manual valve is to direct fluid to the correct circuit needed for a specific gear or driving range. The manual valve, as the name implies, is manually operated by the driver with a lever located on the side of the valve body. The valve is connected mechanically by either a cable or linkage to the gear-shift mechanism. The valve is held in each of its positions by a spring-loaded roller or ball that engages the "roostercomb" of the manual valve.

ACCUMULATOR

DESCRIPTION

The accumulator (Fig. 36) is a hydraulic device that has the sole purpose of cushioning the application of a band or clutch. The accumulator consists of a dual-land piston and a spring located in a bore in the transmission case.

OPERATION

Line pressure is directed between the lands of the piston (Fig. 37), bottoming it against the accumulator plate. The accumulator stays in this position after the transmission is placed into a Drive position. When the 1-2 upshift occurs (Fig. 38), line pressure

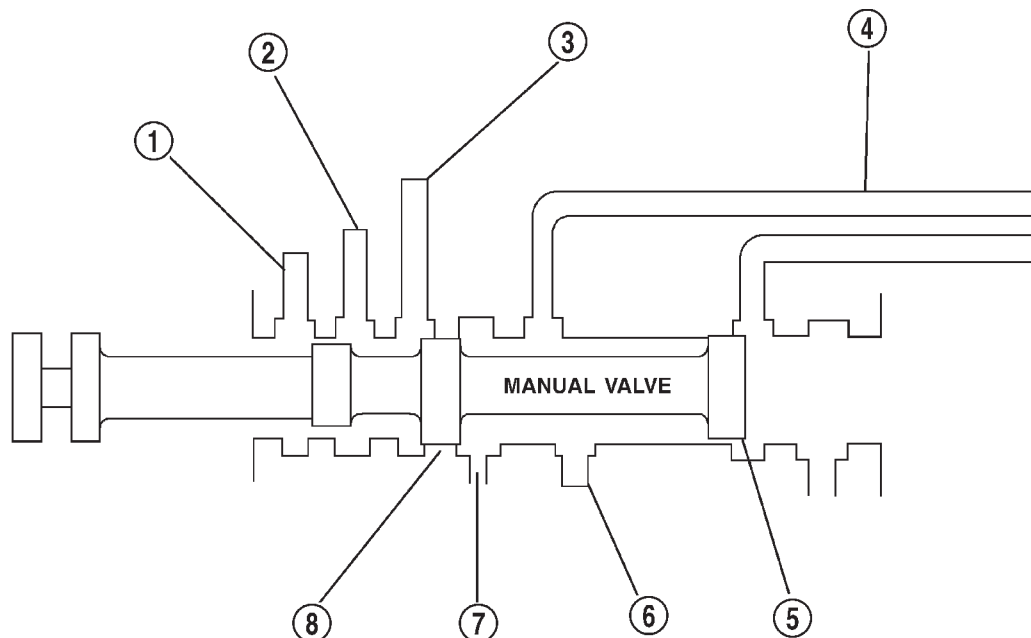

J9121-118

Fig. 36 Accumulator

- 1 - ACCUMULATOR PISTON
2 - PISTON SPRING

is directed to the large end of the piston and then to the kickdown servo. As the line pressure reaches the accumulator, the combination of spring pressure and line pressure forces the piston away from the accumulator plate. This causes a balanced pressure situation, which results in a cushioned band application. After the kickdown servo has become immovable, line pressure will finish pushing the accumulator up into its bore. When the large end of the accumulator piston is seated in its bore, the band or clutch is fully applied.

PISTONS

DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

OPERATION

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

PRESSURE

Pressure (Fig. 39) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

80bfe272

Fig. 39 Force and Pressure Relationship

PRESSURE ON A CONFINED FLUID

Pressure is exerted on a confined fluid (Fig. 40) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no

DESCRIPTION AND OPERATION (Continued)

pressure will be created if the fluid is not confined. It will simply “leak” past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken. The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

using a difference of area to create a difference in pressure to move an object.

80bfe274

Fig. 41 Force Multiplication

PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 42) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller piston moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

80bfe275

Fig. 42 Piston Travel

80bfe273

Fig. 40 Pressure on a Confined Fluid

FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 41), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 41), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept “pressure is the same everywhere” means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than

DESCRIPTION AND OPERATION (Continued)

FRONT CLUTCH

DESCRIPTION

The front clutch assembly (Fig. 43) is composed of the front clutch retainer, pressure plate, four clutch plates, four driving discs, piston, piston return spring, return spring retainer, and snap rings. The front clutch is the forwardmost component in the transmission geartrain and is directly behind the oil pump and is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support.

With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap ring is used to cushion the application of the clutch pack. In some transmissions, the snap ring is selective and used to adjust clutch pack clearance.

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

DESCRIPTION AND OPERATION (Continued)

REAR CLUTCH

DESCRIPTION

The rear clutch assembly (Fig. 44) is composed of the rear clutch retainer, pressure plate, three clutch plates, four driving discs, piston, Belleville spring, and snap rings. The Belleville spring acts as a lever to multiply the force applied on to it by the apply piston. The increased apply force on the rear clutch pack, in comparison to the front clutch pack, is needed to hold against the greater torque load imposed onto the rear pack. The rear clutch is directly behind the front clutch and is considered a driving component.

NOTE: The number of discs and plates may vary with each engine and vehicle combination.

OPERATION

To apply the clutch, pressure is applied between the clutch retainer and piston. The fluid pressure is provided by the oil pump, transferred through the control valves and passageways, and enters the clutch through the hub of the reaction shaft support. With pressure applied between the clutch retainer and piston, the piston moves away from the clutch retainer and compresses the clutch pack. This action applies the clutch pack, allowing torque to flow through the input shaft into the driving discs, and into the clutch plates and pressure plate that are lugged to the clutch retainer. The waved snap ring is used to cushion the application of the clutch pack. In some transmissions, the snap ring is selective and used to adjust clutch pack clearance.

DESCRIPTION AND OPERATION (Continued)

When pressure is released from the piston, the spring returns the piston to its fully released position and disengages the clutch. The release spring also helps to cushion the application of the clutch assembly. When the clutch is in the process of being released by the release spring, fluid flows through a vent and one-way ball-check-valve located in the clutch retainer. The check-valve is needed to eliminate the possibility of plate drag caused by centrifugal force acting on the residual fluid trapped in the clutch piston retainer.

OVERRUNNING CLUTCH

DESCRIPTION

The overrunning clutch (Fig. 45) consists of an inner race, an outer race (or cam), rollers and springs, and the spring retainer. The number of rollers and springs depends on what transmission and which overrunning clutch is being dealt with.

80be45f8

Fig. 45 Overrunning Clutch

- 1 - OUTER RACE (CAM)
- 2 - ROLLER
- 3 - SPRING
- 4 - SPRING RETAINER
- 5 - INNER RACE (HUB)

OPERATION

As the inner race is rotated in a clockwise direction (as viewed from the front of the transmission), the race causes the rollers to roll toward the springs, causing them to compress against their retainer. The compression of the springs increases the clearance between the rollers and cam. This increased clearance between the rollers and cam results in a free-wheeling condition. When the inner race attempts to rotate counterclockwise, the action causes the rollers to roll in the same direction as the race, aided by the pushing of the springs. As the rollers try to move in the same direction as the inner race, they are

wedged between the inner and outer races due to the design of the cam. In this condition, the clutch is locked and acts as one unit.

PLANETARY GEARSET

DESCRIPTION

The planetary gearsets (Fig. 46) are designated as the front and rear planetary gear assemblies and located in such order. A simple planetary gearset consists of three main members:

80be45f9

Fig. 46 Planetary Gearset

- 1 - ANNULUS GEAR
- 2 - SUN GEAR
- 3 - PLANET CARRIER
- 4 - PLANET PINIONS (4)

- The sun gear which is at the center of the system.
- The planet carrier with planet pinion gears which are free to rotate on their own shafts and are in mesh with the sun gear.
- The annulus gear, which rotates around and is in mesh with the planet pinion gears.

NOTE: The number of pinion gears does not affect the gear ratio, only the duty rating.

OPERATION

With any given planetary gearset, several conditions must be met for power to be able to flow:

- One member must be held.
- Another member must be driven or used as an input.
- The third member may be used as an output for power flow.
- For direct drive to occur, two gear members in the front planetary gearset must be driven.

NOTE: Gear ratios are dependent on the number of teeth on the annulus and sun gears.

DESCRIPTION AND OPERATION (Continued)

BANDS**DESCRIPTION****KICKDOWN (FRONT) BAND**

The kickdown, or “front”, band (Fig. 47) holds the common sun gear of the planetary gear sets. The front (kickdown) band is made of steel, and faced on its inner circumference with a friction-type lining. One end of the band is anchored to the transmission case, and the other is acted on with a pushing force by a servo piston. The front band is a single-wrap design (the band does not completely encompass/wrap the drum that it holds).

**Fig. 47 Front Band**

- 1 – FRONT BAND
2 – TRANSMISSION HOUSING

LOW/REVERSE (REAR) BAND

The low/reverse band, or “rear”, band (Fig. 48) is similar in appearance and operation to the front band. The rear band of the 32RH is slightly different in that it does not use a link bar, but is acted directly on by the apply lever. This is referred to as a double-wrap band design (the drum is completely encompassed/wrapped by the band). The double-wrap band provides a greater holding power in comparison to the single-wrap design.

OPERATION**KICKDOWN (FRONT) BAND**

The kickdown band holds the common sun gear of the planetary gear sets by applying and holding the front clutch retainer, which is splined to the sun gear driving shell, and in turn splined directly to the sun gear. The application of the band by the servo is typically done by an apply lever and link bar.

80a483e1

Fig. 48 Rear Band

- 1 – PLANETARY GEARTRAIN
2 – REAR BAND
3 – LEVER
4 – SERVO
5 – ADJUSTER

LOW/REVERSE (REAR) BAND

The rear band holds the rear planet carrier stationary by being mounted around and applied to the low/reverse drum.

SERVOS**DESCRIPTION****KICKDOWN (FRONT) SERVO**

The kickdown servo (Fig. 49) consists of a two-land piston with an inner piston, a piston rod and guide, and a return spring. The dual-land piston uses seal rings on its outer diameters and an O-ring for the inner piston.

LOW/REVERSE (REAR) SERVO

The rear (low/reverse) servo consists of a single stage or diameter piston and a spring loaded plug. The spring is used to cushion the application of the rear (low/reverse) band.

OPERATION**KICKDOWN (FRONT) SERVO**

The application of the piston is accomplished by applying pressure between the two lands of the piston. The pressure acts against the larger lower land to push the piston downward, allowing the piston rod to extend through its guide against the apply lever. Release of the servo at the 2–3 upshift is accomplished by a combination of spring and line pressure, acting on the bottom of the larger land of the piston.

DESCRIPTION AND OPERATION (Continued)

**Fig. 49 Front Servo**

80be45fa

- 1 - VENT
- 2 - INNER PISTON
- 3 - PISTON
- 4 - SPRING
- 5 - RELEASE PRESSURE
- 6 - APPLY PRESSURE
- 7 - PISTON ROD

The small piston is used to cushion the application of the band by bleeding oil through a small orifice in the larger piston. The release timing of the kickdown servo is very important to obtain a smooth but firm shift. The release has to be very quick, just as the front clutch application is taking place. Otherwise, engine runaway or a shift hesitation will occur. To accomplish this, the band retains its holding capacity until the front clutch is applied, giving a small amount of overlap between them.

LOW/REVERSE (REAR) SERVO

While in the de-energized state (no pressure applied), the piston is held up in its bore by the piston spring. The plug is held down in its bore, in the piston, by the plug spring. When pressure is applied to the top of the piston, the plug is forced down in its bore, taking up any clearance. As the piston moves, it causes the plug spring to compress, and the piston moves down over the plug. The piston continues to move down until it hits the shoulder of the plug and fully applies the band. The period of time from the initial application, until the piston is against the shoulder of the plug, represents a reduced shocking of the band that cushions the shift.

GOVERNOR**DESCRIPTION**

The governor (Fig. 50) valve body is attached to the output shaft of the transmission.

OPERATION

The governor meters hydraulic pressure (Fig. 51), and this metered pressure is used to signal the transmission when it is time for a shift to occur. It does this by balancing governor pressure on one side of a shift valve, and throttle pressure on the other. When governor pressure increases far enough to overcome the throttle pressure on the valve, a shift occurs.

With the gearshift selector in a forward driving range, line pressure flows from the manual valve and down to the governor valve. When the output shaft starts to rotate with vehicle motion (Fig. 52), the governor weight assembly will start to move outward due to centrifugal force. As the weight is moved outward, it will pull the valve with it until the land of the valve uncovers the line pressure port. As the port begins to become uncovered, governor pressure is metered. As the vehicle's speed continues to increase (Fig. 53), the weight assembly will be at a point at which governor pressure is acting on the left side of the reaction area of the valve. This produces sufficient force to compress the spring and allow the outer weight to move out against the outer governor body retaining ring. At a very high speed, the governor valve will be opened as far as possible. In this condition, it is possible for governor pressure to meet, but not to exceed, line pressure. Generally governor pressure ranges from 0–100 psi from idle to maximum speed, and rises proportionally with the increase in output shaft speed. Governor pressure and throttle pressure are acting upon the shift valves to determine when a shift will occur. Governor pressure is a direct indication of road speed, and throttle pressure is an indication of engine load. When both parameters have been met by the throttle and governor pressures, an upshift or downshift will occur.

GEARSHIFT MECHANISM**DESCRIPTION**

The shift mechanism is cable operated and provides six shift positions. The shift indicator is located on the console next to the gear shift. The shift positions are:

- Park (P)
- Reverse (R)
- Neutral (N)
- Drive (D)
- Manual Second (2)
- Manual Low (1)

OPERATION

Manual low (1) range provides first gear only. Over run braking is also provided in this range. Manual second (2) range provides first and second gear only.

Drive range provides first, second, and third gear ranges.

CONVERTER DRAINBACK VALVE**DESCRIPTION**

The drainback valve is located in the transmission cooler outlet (pressure) line.

OPERATION

The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM**DESCRIPTION**

The Brake Transmission Shifter/Ignition Interlock (BTSI), is a cable and solenoid operated system. It interconnects the automatic transmission floor mounted shifter to the steering column ignition switch (Fig. 54).

OPERATION

The system locks the shifter into the PARK position. The Interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half an inch. A magnetic holding device in line with the park/brake interlock cable is energized when the ignition is in

DESCRIPTION AND OPERATION (Continued)

**Fig. 51 Governor—No Output Shaft Rotation**

**Fig. 52 Governor—Moderate Output Shaft Rotation**

the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position (Fig. 55) unless the shifter is fully locked into the PARK position.

DIAGNOSIS AND TESTING

AUTOMATIC TRANSMISSION DIAGNOSIS

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component mal-

**Fig. 53 Governor—High Output Shaft Rotation**

functions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve, clutch and servo operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair

DIAGNOSIS AND TESTING (Continued)

- failure to replace contaminated converter after repair

The use of non recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission for some time, an overhaul may also be necessary; especially if shift problems had developed.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

PRELIMINARY DIAGNOSIS

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVEABLE

- (1) Check for transmission fault codes using DRB scan tool.
- (2) Check fluid level and condition.
- (3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.
- (4) Road test and note how transmission upshifts, downshifts, and engages.
- (5) Perform stall test if complaint is based on sluggish acceleration. Or, if abnormal throttle opening is needed to maintain normal speeds with a properly tuned engine.
- (6) Perform hydraulic pressure test if shift problems were noted during road test.
- (7) Perform air-pressure test to check clutch-band operation.

VEHICLE IS DISABLED

- (1) Check fluid level and condition.
- (2) Check for broken or disconnected gearshift or throttle linkage.
- (3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
- (4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:
 - (a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
 - (b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.
 - (c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

GEARSHIFT CABLE

- (1) The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.
- (2) Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.
- (3) With floor shift lever handle push-button not depressed and lever in:
 - (a) PARK position—Apply forward force on center of handle and remove pressure. Engine starts must be possible.

DIAGNOSIS AND TESTING (Continued)

(b) PARK position—Apply rearward force on center of handle and remove pressure. Engine starts must be possible.

(c) NEUTRAL position—Normal position. Engine starts must be possible.

(d) NEUTRAL position—Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from neutral to reverse.

THROTTLE VALVE CABLE

Transmission throttle valve cable adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle downshift sensitivity.

If cable setting is too loose, early shifts and slippage between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle downshifts may be very sensitive. Refer to the Adjustments section for the proper adjustment procedure.

ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

ANALYZING ROAD TEST

Refer to the Clutch and Band Application chart and note which elements are in use in the various gear ranges.

Verify that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Verify that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear. For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission

DRIVE ELEMENTS	Gearshift Lever Position							
	P	R	N	D			2	1
				1	2	3	1	2
FRONT CLUTCH		•				•		
FRONT BAND (KICKDOWN)					•			•
REAR CLUTCH				•	•	•	•	•
REAR BAND (LOW-REV.)		•						•
OVER-RUNNING CLUTCH				•			•	•

J9021-33

Fig. 56 Clutch And Band Application

overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, verify that the front and rear clutches are applied simultaneously only in D range third gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If slippage occurs during the third gear and the direct clutch were to fail, the transmission would lose both reverse gear and overrun braking in 2 position (manual second gear). If the transmission slips in any other forward gears, the transmission rear clutch is probably slipping.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and two test gauges are required for the pressure test. Test Gauge C-3292 has a 100 psi range and is used at the accumulator,

DIAGNOSIS AND TESTING (Continued)

governor, and front servo pressure ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo port and overdrive test ports where pressures are higher. In cases where two test gauges are required, the 300 psi gauge can be used at any of the other test ports.

Pressure Test Port Locations

Pressure test ports locations are provided at the accumulator, front servo, and rear servo, governor passage, and overdrive clutch pressure passage (Fig. 57), (Fig. 58) and (Fig. 59).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

Fig. 57 Pressure Test Ports At Side Of Case

- 1 - REAR SERVO PORT
- 2 - LINE PRESSURE PORT
- 3 - FRONT SERVO PORT

Fig. 58 Pressure Test Ports At Rear Of Case—2WD

- 1 - GOVERNOR PRESSURE PORT
- 2 - REAR SERVO PRESSURE PORT

Connect a tachometer to the engine. Position the tachometer so it can be observed from under the vehicle. Raise the vehicle on a hoist that will allow the wheels to rotate freely.

Fig. 59 Pressure Test Ports At Rear Of Case—4WD

PRESSURE TEST PROCEDURE

Test One - Transmission In 1 Range

This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Test Gauges C-3292 and C-3293-SP are required for this test. Gauge C-3292 has a 100 psi range. Gauge C-3293-SP has a 300 psi range.

- (1) Connect 100 psi Gauge C-3292 to accumulator port.
- (2) Connect 300 psi Gauge C-3293-SP to rear servo port (Fig. 57) and (Fig. 58).
- (3) Disconnect throttle and gearshift rods from manual and throttle levers.
- (4) Start and run engine at 1000 rpm.
- (5) Move shift lever (on manual lever shaft) all the way forward into 1 range.
- (6) Move transmission throttle lever from full forward to full rearward position and note pressures on both gauges.
- (7) Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.
- (8) Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

Test Two - Transmission In 2 Range

This test checks pump output and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.

- (1) Connect test gauge to accumulator pressure port (Fig. 57) and (Fig. 58).
- (2) Start and run engine at 1000 rpm.
- (3) Move shift lever on valve body manual lever shaft, one detent rearward from full forward position. This is 2 range.
- (4) Move transmission throttle lever from full forward to full rearward position and read pressure at both gauges.

DIAGNOSIS AND TESTING (Continued)

(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

Test Three - Transmission In D Range

This test checks pressure regulation and condition of the clutch circuits. Use both pressure Test Gauges C-3292 and C-3293-SP for this test.

(1) Connect test gauges to accumulator and front servo ports (Fig. 57) and (Fig. 58). Use either test gauge at the two ports.

(2) Start and run engine at 1600 rpm for this test.

(3) Move selector lever to D range. This is two detents rearward from full forward position.

(4) Read pressures on both gauges as transmission throttle lever is moved from full forward to full rearward position.

(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase as lever is moved rearward.

(6) Front servo is pressurized only in D range and should be same as line pressure within 3 psi (21 kPa) up to downshift point.

Test Four - Transmission In Reverse

This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.

(1) Connect 300 psi gauge to rear servo port (Fig. 57) and (Fig. 58).

(2) Start and run engine at 1600 rpm for test.

(3) Move valve body selector lever four detents rearward from the full forward position. This is Reverse range.

(4) Move throttle lever all way forward then all way rearward and note gauge readings.

(5) Pressure should be 145 - 175 psi (1000-1207 kPa) with lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is moved rearward.

Test Five - Governor Pressure

This test checks governor operation by measuring governor pressure response to changes in engine speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift.

(1) Connect 100 psi Test Gauge C-3292 to governor pressure port (Fig. 57) and (Fig. 58).

(2) Move shift lever to D range.

(3) Start and run engine at curb idle speed and note pressure. At idle and with vehicle stopped, pressure should be zero to 1.5 psi maximum. If pressure exceeds this figure, governor valve or weights are sticking open.

(4) Slowly increase engine speed and observe speedometer and pressure test gauge. Governor pressure should increase in proportion to vehicle speed.

(5) Pressure rise should be smooth and drop back to 0 to 1.5 psi when wheels stop rotating.

(6) Compare results of pressure tests with analysis charts (Fig. 60).

TEST CONDITION	INDICATION
Line pressure OK during any one test	Pump and regulator valve OK
Line pressure OK in R but low in D, 2, 1	Leakage in rear clutch area (servo, clutch seals, governor support seal rings on park gear)
Pressure OK in 1, 2 but low in D3 and R	Leakage in front clutch area (servo, clutch seals, retainer bore, pump seal rings)
Pressure OK in 2 but low in R and 1	Leakage in rear servo
Front servo pressure in 2	Leakage in servo (broken servo ring or cracked servo piston)
Pressure low in all positions	Clogged filter, stuck pressure regulator valve, worn or defective pump
Governor pressure too high at idle speed	Governor valve sticking open
Governor pressure low at all mph figures	Governor valve sticking closed
Lubrication pressure low at all throttle positions	Clogged drainback valve, oil cooler or lines, seal rings leaking, output shaft plugged with debris, worn bushings in pump or clutch retainer

Fig. 60 Pressure Test Analysis

AIR TESTING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 61).

DIAGNOSIS AND TESTING (Continued)

**Fig. 61 Air Pressure Test Passages**

- 1 - REAR SERVO APPLY
- 2 - FRONT SERVO APPLY
- 3 - PUMP SUCTION
- 4 - FRONT CLUTCH APPLY
- 5 - FRONT SERVO RELEASE
- 6 - LINE PRESSURE TO ACCUMULATOR
- 7 - PUMP PRESSURE
- 8 - TO CONVERTER
- 9 - REAR CLUTCH APPLY
- 10 - FROM CONVERTER
- 11 - TO COOLER

Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Front Servo Apply Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to

tighten around the drum. Spring pressure should release the servo when air pressure is removed.

CONVERTER HOUSING FLUID LEAK DIAGNOSIS

When diagnosing converter housing fluid leaks, two items must be established before repair.

- (1) Verify that a leak condition actually exists.
- (2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump O-ring or pump body leaks follow the same path as a seal leak (Fig. 62). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 62). Pump seal or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

**Fig. 62 Converter Housing Leak Paths**

- 1 - PUMP SEAL
- 2 - PUMP VENT
- 3 - PUMP BOLT
- 4 - PUMP GASKET
- 5 - CONVERTER HOUSING
- 6 - CONVERTER
- 7 - REAR MAIN SEAL LEAK

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

- (1) Leaks at the weld joint around the outside diameter weld (Fig. 63).

DIAGNOSIS AND TESTING (Continued)

(2) Leaks at the converter hub weld (Fig. 63).

Fig. 63 Converter Leak Points—Typical

- 1 - OUTSIDE DIAMETER WELD
- 2 - TORQUE CONVERTER HUB WELD
- 3 - STARTER RING GEAR
- 4 - LUG

CONVERTER HOUSING AREA LEAK CORRECTION

- (1) Remove converter.
- (2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.
- (3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.
- (4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is

scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite 592, or Permatex No. 2 to plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

DIAGNOSIS CHARTS

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts, in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for neutral, third, fourth and reverse gear ranges. Normal working pressures are also supplied for each of the gear ranges.

DIAGNOSIS AND TESTING (Continued)

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH ENGAGEMENT FROM NEUTRAL TO DRIVE OR REVERSE	1. Fluid Level Low	1. Add Fluid
	2. Throttle Linkage Misadjusted	2. Adjust linkage - setting may be too long.
	3. Mount and Driveline Bolts Loose	3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts.
	4. U-Joint Worn/Broken	4. Remove propeller shaft and replace U-Joint.
	5. Axle Backlash Incorrect	5. Check per Service Manual. Correct as needed.
	6. Hydraulic Pressure Incorrect	6. Check pressure. Remove, overhaul or adjust valve body as needed.
	7. Band Misadjusted.	7. Adjust rear band.
	8. Valve Body Check Balls Missing.	8. Inspect valve body for proper check ball installation.
	9. Axle Pinion Flange Loose.	9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged.
	10. Clutch, band or planetary component Damaged.	10. Remove, disassemble and repair transmission as necessary.
	11. Converter Clutch (if equipped) Faulty.	11. Replace converter and flush cooler and line before installing new converter.
DELAYED ENGAGEMENT FROM NEUTRAL TO DRIVE OR REVERSE	1. Fluid Level Low.	1. Correct level and check for leaks.
	2. Filter Clogged.	2. Change filter.
	3. Gearshift Linkage Misadjusted.	3. Adjust linkage and repair linkage if worn or damaged.
	4. Rear Band Misadjusted.	4. Adjust band.
	5. Valve Body Filter Plugged.	5. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary.
	6. Oil Pump Gears Worn/Damaged.	6. Remove transmission and replace oil pump.
	7. Hydraulic Pressure Incorrect.	7. Perform pressure test, remove transmission and repair as needed.
	8. Reaction Shaft Seal Rings Worn/Broken.	8. Remove transmission, remove oil pump and replace seal rings.
	9. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged.	9. Remove and disassemble transmission and repair as necessary.
	10. Governor Valve Stuck.	10. Remove and inspect governor components. Replace worn or damaged parts.
	11. Regulator Valve Stuck.	11. Clean.
	12. Cooler Plugged.	12. Flush transmission cooler and inspect convertor drainback valve.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DRIVE RANGE (REVERSE OK)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Repair or replace linkage components.
	3. Rear Clutch Burnt.	3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed.
	4. Valve Body Malfunction.	4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged.
	5. Transmission Overrunning Clutch Broken.	5. Remove and disassemble transmission. Replace overrunning clutch.
	6. Input Shaft Seal Rings Worn/Damaged.	6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts.
	7. Front Planetary Failed Broken.	7. Remove and repair.
NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts.
	3. U-Joint/Axle/Transfer Case Broken.	3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section.
	4. Filter Plugged.	4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary.
	5. Oil Pump Damaged.	5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary.
	6. Valve Body Malfunctioned.	6. Check press and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition.
	7. Transmission Internal Component Damaged.	7. Remove and disassemble transmission. Repair or replace failed components as needed. Remove and disassemble transmission. Repair or replace failed components as needed.
	8. Park Sprag not Releasing	8. Remove, disassemble, repair.
	9. Torque Converter Damage.	9. Check Stall Speed, Worn/Damaged/Stuck. Inspect and replace as required.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES)	1. Fluid Level Low/High.	1. Correct fluid level and check for leaks if low.
	2. Throttle Linkage Misadjusted.	2. Adjust linkage as described in service section.
	3. Throttle Linkage Binding.	3. Check cable for binding. Check for return to closed throttle at transmission.
	4. Gearshift Linkage/Cable Misadjusted.	4. Adjust linkage/cable as described in service section.
	5. Fluid Filter Clogged.	5. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test.
	6. Governor Valve Sticking.	6. Inspect, clean or repair.
	7. Governor Seal Rings Worn/Damaged.	7. Inspect/replace.
	8. Clutch or Servo Failure.	8. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed.
	9. Front Band Misadjusted.	9. Adjust band.
	10. Pump Suction Passage Leak.	10. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed.
NO REVERSE (D RANGES OK)	1. Gearshift Linkage/Cable Misadjusted/Damaged.	1. Repair or replace linkage parts as needed.
	2. Park Sprag Sticking.	2. Inspect and replace as necessary.
	3. Rear Band Misadjusted/Worn.	3. Adjust band; replace.
	4. Valve Body Malfunction.	4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged.
	5. Rear Servo Malfunction.	5. Remove and disassemble transmission. Replace worn/damaged servo parts as necessary.
	6. Front Clutch Burnt.	6. Remove and disassemble transmission. Replace worn, damaged clutch parts as required.
HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT)	1. Governor Valve, Shaft, Weights or Body Damaged/Stuck.	1. Remove governor assembly and clean or repair as necessary.
	2. Valve Body Malfunction.	2. Stuck 1-2 shift valve or governor plug.
	3. Front Servo/Kickdown Band Damaged/Burned.	3. Repair/replace.
MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW	1. Valve Body Malfunction.	1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug.
	2. Governor Valve Sticking.	2. Remove, clean and inspect. Replace faulty parts.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY)	1. Governor Valve Sticking.	1. Remove governor, clean, inspect and repair as required.
	2. Valve Body Malfunction.	2. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs.
	3. Front Servo Piston Cocked in Bore.	3. Inspect servo and repair as required.
	4. Front Band Linkage Malfunction	4. Inspect linkage and look for bind in linkage.
NO KICKDOWN OR NORMAL DOWNSHIFT	1. Throttle Linkage Misadjusted.	1. Adjust linkage.
	2. Accelerator Pedal Travel Restricted.	2. Floor mat under pedal, accelerator cable worn or brackets bent.
	3. Governor/Valve Body Hydraulic Pressures Too High or Too Low Due to Sticking Governor, Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments.	3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	4. Valve Body Malfunction.	4. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	5. Valve Body Malfunction.	5. Sticking 1-2, 2-3 shift valves, or governor plugs.
STUCK IN LOW GEAR (WILL NOT UPSHIFT)	1. Throttle Linkage Misadjusted/Stuck.	1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring.
	2. Gearshift Linkage Misadjusted.	2. Adjust linkage and repair linkage if worn or damaged.
	3. Governor/Valve Body, Governor Valve Stuck Closed; Loose Output Shaft Support or Governor Housing Bolts, Leaking Seal Rings or Valve Body Problem (i.e., Stuck 1- 2 Shift Valve/Gov. Plug).	3. Check line and governor pressures to determine cause. Correct as required.
	4. Front Band Out of Adjustment.	4. Adjust Band.
	5. Clutch or Servo Malfunction.	5. Air pressure check operation of clutches and bands. Repair faulty component.
CREEPS IN NEUTRAL	1. Gearshift Linkage Misadjusted.	1. Adjust linkage.
	2. Rear Clutch Dragging/Warped Welded.	2. Disassemble and repair.
	3. Valve Body Malfunction.	3. Perform hydraulic pressure test to determine cause and repair as required.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
BUZZING NOISE	1. Fluid Level Low	1. Add fluid and check for leaks.
	2. Shift Cable Misassembled.	2. Route cable away from engine and bell housing.
	3. Valve Body Misassembled.	3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws.
	4. Pump Passages Leaking	4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts.
	5. Cooling System Cooler Plugged.	5. Flow check cooler circuit. Repair as needed.
	6. Overrunning Clutch Damaged.	6. Replace clutch.
SLIPS IN REVERSE ONLY	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Gearshift Linkage Misadjusted.	2. Adjust linkage.
	3. Rear Band Misadjusted.	3. Adjust band.
	4. Rear Band Worn.	4. Replace as required.
	5. Hydraulic Pressure Too Low.	5. Perform hydraulic pressure tests to determine cause.
	6. Rear Servo Leaking.	6. Air pressure check clutch-servo operation and repair as required.
	7. Band Linkage Binding.	7. Inspect and repair as required.
SLIPS IN FORWARD DRIVE RANGES	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Fluid Foaming.	2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary.
	3. Throttle Linkage Misadjusted.	3. Adjust linkage.
	4. Gearshift Linkage Misadjusted.	4. Adjust linkage.
	5. Rear Clutch Worn.	5. Inspect and replace as needed.
	6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking Governor, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines	6. Perform hydraulic and air pressure tests to determine cause.
	7. Rear Clutch Malfunction, Leaking Seals or Worn Plates.	7. Air pressure check clutch-servo operation and repair as required.
	8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only).	8. Replace Clutch.
SLIPS IN LOW GEAR "D" ONLY, BUT NOT IN 1 POSITION	Overrunning Clutch Faulty.	Replace overrunning clutch.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
GROWLING, GRATING OR SCRAPING NOISES	1. Drive Plate Broken.	1. Replace.
	2. Torque Converter Bolts Hitting Dust Shield.	2. Dust shield bent. Replace or repair.
	3. Planetary Gear Set Broken/ Seized.	3. Check for debris in oil pan and repair as required.
	4. Overrunning Clutch Worn/Broken.	4. Inspect and check for debris in oil pan. Repair as required.
	5. Oil Pump Components Scored/ Binding.	5. Remove, inspect and repair as required.
	6. Output Shaft Bearing or Bushing Damaged.	6. Remove, inspect and repair as required.
	7. Clutch Operation Faulty.	7. Perform air pressure check and repair as required.
	8. Front and Rear Bands Misadjusted.	8. Adjust bands.
DRAGS OR LOCKS UP	1. Fluid Level Low.	1. Check and adjust level.
	2. Clutch Dragging/Failed	2. Air pressure check clutch operation and repair as required.
	3. Front or Rear Band Misadjusted.	3. Adjust bands.
	4. Case Leaks Internally.	4. Check for leakage between passages in case.
	5. Servo Band or Linkage Malfunction.	5. Air pressure check servo operation and repair as required.
	6. Overrunning Clutch Worn.	6. Remove and inspect clutch. Repair as required.
	7. Planetary Gears Broken.	7. Remove, inspect and repair as required (look for debris in oil pan).
	8. Converter Clutch Dragging.	8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required.
WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Shift Cable Incorrect Routing.	2. Check shift cable for correct routing. Should not touch engine or bell housing.
TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR	Lockup Solenoid, Relay or Wiring Shorted/Open.	Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary.
HARSH 1-2 OR 2-3 SHIFTS	Lockup Solenoid Malfunction.	Remove valve body and replace solenoid assembly.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO START IN PARK OR NEUTRAL	1. Gearshift Linkage/Cable Misadjusted.	1. Adjust linkage/cable.
	2. Neutral Switch Wire Open/Cut.	2. Check continuity with test lamp. Repair as required.
	3. Neutral Switch Faulty.	3. Refer to service section for test and replacement procedure.
	4. Neutral Switch Connect Faulty.	4. Connectors spread open. Repair.
	5. Valve Body Manual Lever Assembly Bent/Worn/Broken.	5. Inspect lever assembly and replace if damaged.
NO REVERSE (OR SLIPS IN REVERSE)	1. Direct Clutch Pack (front clutch) Worn.	1. Disassemble unit and rebuild clutch pack.
	2. Rear Band Misadjusted.	2. Adjust band.
	3. Front Clutch Malfunctioned/Burnt.	3. Air pressure test clutch operation. Remove and rebuild if necessary.
OIL LEAKS (ITEMS LISTED REPRESENT POSSIBLE LEAK POINTS AND SHOULD ALL BE CHECKED.)	1. Speedometer Adapter Leaks.	1. Replace both adapter seals.
	2. Fluid Lines and Fittings Loose/Leaks/Damaged.	2. Tighten fittings. If leaks persist, replace fittings and lines if necessary.
	3. Filler Tube (where tube enters case) Leaks/Damaged.	3. Replace O-ring seal. Inspect tube for cracks in tube.
	4. Pressure Port Plug Loose Loose/Damaged.	4. Tighten to correct torque. Replace plug or reseal if leak persists.
	5. Pan Gasket Leaks.	5. Tighten pan screws to 150 inch pounds. If leaks persist, replace gasket. Do no over tighten screws.
	6. Valve Body Manual Lever Shaft Seal Leaks/Worn.	6. Replace shaft seal.
	7. Rear Bearing Access Plate Leaks.	7. Replace gasket. Tighten screws.
	8. Gasket Damaged or Bolts are Loose.	8. Replace bolts or gasket or tighten both.
	9. Adapter/Extension Gasket Damaged Leaks/Damaged.	9. Replace gasket.
	10. Neutral Switch Leaks/Damaged.	10. Replace switch and gasket.
	11. Converter Housing Area Leaks.	11. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug.
	12. Pump Seal Leaks/Worn/Damaged.	12. Replace seal.
	13. Torque Converter Weld Leak/Cracked Hub.	13. Replace converter.
	14. Case Porosity Leaks.	14. Replace case.

SERVICE PROCEDURES

FLUID LEVEL CHECK

Transmission fluid level should be checked monthly under normal operation. If the vehicle is used for trailer towing or similar heavy load hauling, check fluid level and condition weekly. Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature.

FLUID LEVEL CHECK PROCEDURE

- (1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).
- (2) Position vehicle on level surface.
- (3) Start and run engine at curb idle speed.
- (4) Apply parking brakes.
- (5) Shift transmission momentarily into all gear ranges. Then shift transmission back to Neutral.
- (6) Clean top of filler tube and dipstick to keep dirt from entering tube.
- (7) Remove dipstick (Fig. 64) and check fluid level as follows:
 - (a) Correct acceptable level is in crosshatch area.
 - (b) Correct maximum level is to MAX arrow mark.
 - (c) Incorrect level is at or below MIN line.
 - (d) If fluid is low, add only enough Mopar® ATF Plus 3 to restore correct level. Do not overfill.

CAUTION: Do not overfill the transmission. Overfilling may cause leakage out the pump vent which can be mistaken for a pump seal leak. Overfilling will also cause fluid aeration and foaming as the excess fluid is picked up and churned by the gear train. This will significantly reduce fluid life.

Fig. 64 Dipstick Fluid Level Marks—Typical

- 1 - DIPSTICK
- 2 - MAXIMUM CORRECT FLUID LEVEL
- 3 - ACCEPTABLE FLUID LEVEL

FLUID AND FILTER REPLACEMENT

Refer to the Maintenance Schedules in Group 0, Lubrication and Maintenance, for proper service

intervals. The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Remove the transmission/skip plate as necessary to access the transmission oil pan.
- (3) Place a large diameter shallow drain pan beneath the transmission pan.
- (4) Remove bolts holding front and sides of pan to transmission (Fig. 65).
- (5) Loosen bolts holding rear of pan to transmission.
- (6) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.
- (7) Hold up pan and remove remaining bolts holding pan to transmission.
- (8) While holding pan level, lower pan away from transmission.
- (9) Pour remaining fluid in pan into drain pan.
- (10) Remove screws holding filter to valve body (Fig. 66).
- (11) Separate filter from valve body and pour fluid in filter into drain pan.
- (12) Dispose used trans fluid and filter properly.

Fig. 65 Transmission Pan—Typical

8031e88b

- 1 - GASKET
- 2 - PAN
- 3 - TRANSMISSION

INSPECTION

Inspect bottom of pan and magnet for excessive amounts of metal or fiber contamination. A light coating of clutch or band material on the bottom of the pan does not indicate a problem unless accompanied by slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts or debris, refer to the diagnosis section of this group.

Check the adjustment of the front and rear bands, adjust if necessary. Refer to Adjustment section of this group for proper procedure.

SERVICE PROCEDURES (Continued)

**Fig. 66 Transmission Filter—Typical**

- 1 - FILTER
2 - TRANSMISSION

CLEANING

- (1) Using a suitable solvent, clean pan and magnet.
- (2) Using a suitable gasket scraper, clean gasket material from gasket surface of transmission case and the gasket flange around the pan.

INSTALLATION

- (1) Place replacement filter in position on valve body.
- (2) Install screws to hold filter to valve body (Fig. 66). Tighten screws to 4 N·m (35 in. lbs.) torque.
- (3) Place new gasket in position on pan, and install pan on transmission.
- (4) Place pan in position on transmission.
- (5) Install screws to hold pan to transmission (Fig. 65). Tighten bolts to 17 N·m (150 in. lbs.) torque.
- (6) Install the transmission/skip plate.
- (7) Lower vehicle and fill transmission with Mopar® ATF Plus 3, type 7176 fluid.

TRANSMISSION FILL PROCEDURE

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

- (1) Remove dipstick and insert clean funnel in transmission fill tube.
- (2) Add following initial quantity of Mopar® ATF Plus 3 to transmission:
 - (a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF Plus 3 to transmission.
 - (b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF Plus 3 to transmission.
- (3) Apply parking brakes.
- (4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick**. Check to see if the oil level is equal on both sides of the dipstick. If one side is noticeably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

CONVERTER DRAINBACK CHECK VALVE SERVICE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates significant amounts of sludge and/or clutch particles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.

OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil

SERVICE PROCEDURES (Continued)

cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF+3, type 7176, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 20 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

FLUSHING COOLERS AND TUBES

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

The only recommended procedure for flushing coolers and lines is to use Tool 6906A Cooler Flusher.

CAUTION: The transmission oil cooler requires a two stage flushing procedure due to an internally mounted thermostat. Failure to follow the procedure can result in severe transmission damage.

WARNING: WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1-1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES.

KEEP LIGHTED CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.

KEEP THE AREA WELL VENTILATED.

DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR

15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.

COOLER FLUSH USING TOOL 6906A

(1) Remove cover plate filler plug on Tool 6906A. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906A.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, **ALWAYS** reverse flush.

NOTE: The converter drainback valve must be removed and an appropriate replacement hose installed to bridge the space between the transmission cooler line and the cooler fitting. Failure to remove the drainback valve will prevent reverse flushing the system. A suitable replacement hose can be found in the adapter kit supplied with the flushing tool.

(5) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Remove the transmission oil cooler from the vehicle. Refer to the Group 7, Cooling System, for the proper procedures.

(8) Remove the transmission oil cooler thermostat. Refer to the Group 7, Cooling System, for the proper procedures.

(9) Re-install the thermostat cover onto the oil cooler and install the snap ring.

(10) Re-connect the oil cooler to the transmission cooler lines.

(11) Turn pump ON for two to three minutes to flush cooler(s) and lines.

NOTE: This flushes the bypass circuit of the cooler only.

(12) Turn pump OFF.

(13) Remove the thermostat cover from the oil cooler.

(14) Install Special Tool Cooler Plug 8414 into the transmission oil cooler.

(15) Turn pump ON for two to three minutes to flush cooler(s) and lines.

SERVICE PROCEDURES (Continued)

NOTE: This flushes the main oil cooler core passages only.

- (16) Turn pump OFF.
- (17) Remove the thermostat cover from the oil cooler.
- (18) Remove Special Tool Cooler Plug 8414 from the transmission oil cooler.
- (19) Install a new thermostat spring, thermostat, cover, and snap-ring into the transmission oil cooler.
- (20) Install the transmission oil cooler onto the vehicle.
- (21) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.
- (22) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.
- (23) Place CLEAR suction line into a one quart container of Mopar® ATF Plus 3, type 7176 automatic transmission fluid.
- (24) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.
- (25) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil tap, or equivalent, and installing a Heli-Coil insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL AND INSTALLATION

TRANSMISSION

CAUTION: The transmission and torque converter must be removed as an assembly to avoid component damage. The converter drive plate, pump bushing, or oil seal can be damaged if the converter is left attached to the driveplate during removal.

REMOVAL

- (1) Disconnect battery negative cable.
- (2) Disconnect and lower or remove necessary exhaust components.
- (3) Remove engine-to-transmission bending braces.

- (4) Disconnect fluid cooler lines at transmission.
- (5) Remove starter motor.
- (6) Disconnect and remove crankshaft position sensor (Fig. 67). Retain sensor attaching bolts.

CAUTION: The crankshaft position sensor can be damaged during transmission removal (or installation) if the sensor is left in place. To avoid damage, remove the sensor before removing the transmission.

Fig. 67 Crankshaft Position Sensor—2.5L Engine

- 1 - EXHAUST DOWN PIPE
- 2 - TRANSMISSION HOUSING
- 3 - CRANKSHAFT POSITION SENSOR

- (7) Remove torque converter access cover.
- (8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.
- (9) Remove skid plate for access.
- (10) Remove the fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal. On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing.
- (11) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.
- (12) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shafts.
- (13) Disconnect wires from park/neutral position switch and vehicle speed sensor.
- (14) Disconnect gearshift cable from transmission manual valve lever.
- (15) Disconnect throttle valve cable from transmission bracket and throttle valve lever.
- (16) Disconnect shift rod from transfer case shift lever or remove shift lever from transfer case.

REMOVAL AND INSTALLATION (Continued)

(17) Support rear of engine with safety stand or jack.

(18) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(19) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket and remove rear support.

(20) Remove bolts attaching crossmember to frame and remove crossmember.

(21) Disconnect transfer case vent hose. Then disconnect vacuum switch harness.

(22) Remove transfer case.

(23) Remove all converter housing bolts.

(24) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(25) Hold torque converter in place during transmission removal.

(26) Lower transmission and remove assembly from under the vehicle.

(27) To remove torque converter, carefully slide torque converter out of the transmission.

Fig. 68 Typical Method Of Checking Converter Seating

1 - SCALE

2 - STRAIGHTEDGE

INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

(2) Lubricate converter drive hub and oil pump seal lip with transmission fluid.

(3) Align converter and oil pump.

(4) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(5) Check converter seating with steel scale and straightedge (Fig. 68). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(6) Temporarily secure converter with C-clamp.

(7) Lubricate the pocket in the rear of the crankshaft, in which the converter pilot hub rides, with a light coating of Mopar® High-Temp Grease.

(8) Position transmission on jack and secure it with safety chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(13) Install and tighten bolts that attach transmission converter housing to engine block (Fig. 69).

CAUTION: Be sure the converter housing is fully seated on the engine block dowels before tightening any bolts.

(14) Install torque converter attaching bolts. Tighten bolts to following torque.

- 54 N·m (40 ft. lbs.) with 9.5 in. 3-lug converter
- 74 N·m (55 ft. lbs.) with 9.5 in. 4-lug converter
- 74 N·m (55 ft. lbs.) with 10.0 in. 4-lug converter
- 31 N·m (270 in. lbs.) with 10.75 in. 4-lug converter

verter

(15) Install crankshaft position sensor.

(16) Install transmission fill tube and seal. Install new fill tube seal in transmission before installation.

(17) Connect transmission cooler lines to transmission.

(18) Install transfer case onto transmission.

(19) Install rear crossmember and attach transmission rear support to crossmember.

(20) Remove engine support fixture.

(21) Remove transmission jack.

(22) Connect vehicle speed sensor wires.

(23) Connect wires to park/neutral position switch.

(24) Install crankshaft position sensor.

(25) Install converter housing access cover.

(26) Install exhaust pipes and support brackets, if removed.

REMOVAL AND INSTALLATION (Continued)

Fig. 69 Transmission Attachment

80c070a3

(27) Install starter motor and cooler line bracket.

(28) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

(29) Connect gearshift and linkage and throttle cable.

(30) Connect transfer case shift linkage.

(31) Adjust gearshift linkage and throttle valve cable if necessary.

(32) Align and connect propeller shaft(s).

(33) Install skid plate, rear cushion and bracket, if removed.

(34) Fill transfer case to bottom edge of fill plug hole.

(35) Lower vehicle and fill transmission to correct level with Mopar® ATF Plus 3, type 7176 fluid.

TORQUE CONVERTER

REMOVAL

(1) Remove transmission and torque converter from vehicle.

(2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition.

The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate converter hub and oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

REMOVAL AND INSTALLATION (Continued)

- (3) Align torque converter to oil pump seal opening.
- (4) Insert torque converter hub into oil pump.
- (5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
- (6) Check converter seating with a scale and straightedge (Fig. 70). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.
- (7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.
- (8) Install the transmission in the vehicle.
- (9) Fill the transmission with the recommended fluid.

**Fig. 70 Checking Torque Converter Seating**

- 1 - SCALE
2 - STRAIGHTEDGE

YOKE SEAL REPLACEMENT

REMOVAL

- (1) Raise vehicle.
- (2) Mark propeller shaft and axle yoke for alignment reference.
- (3) Disconnect and remove propeller shaft.
- (4) Remove old seal with Seal Remover C-3985-B (Fig. 71) from extension housing.

INSTALLATION

- (1) Place seal in position on extension housing.
- (2) Drive seal into extension housing with Seal Installer C-3995-A or C-3972 (Fig. 72).
- (3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

**Fig. 71 Removing Extension Housing Yoke Seal**

- 1 - SPECIAL TOOL C-3985-B
2 - SEAL

**Fig. 72 Installing Extension Housing Yoke Seal**

- 1 - SPECIAL TOOL C-4171
2 - SPECIAL TOOL C-3995-A

EXTENSION HOUSING BUSHING

REMOVAL

- (1) Remove housing yoke seal.
- (2) Insert Remover 6957 into extension housing. Tighten tool to bushing and remove bushing (Fig. 73).

INSTALLATION

- (1) Align bushing oil hole with oil slot in extension housing.
- (2) Tap bushing into place with Installer 6951 and Handle C-4171.
- (3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 74).

ADAPTER HOUSING

REMOVAL

- (1) Hoist and support vehicle on safety stands.
- (2) Support transmission with a suitable lifting device.
- (3) Remove transmission skid plate. Refer to Group 13, Frame and Bumpers, for proper procedure.

REMOVAL AND INSTALLATION (Continued)

- (4) Remove propeller shafts. Refer to Group 3, Differential and Driveline, for proper procedure.
- (5) Remove transfer case.
- (6) Remove bolts holding adapter housing to transmission case (Fig. 75).
- (7) Separate adapter housing from transmission.
- (8) Slide adapter housing rearward and off output shaft (Fig. 75).

INSTALLATION

Clear gasket material from sealing surfaces on adapter housing and rear of transmission. Replace output shaft bearing, if necessary.

(1) Install new rear seal in adapter housing. Use Tool Handle C-4171 and Seal Installer C-3860-A to install seal.

(2) Place adapter housing gasket in position on rear of transmission.

(3) Slide adapter housing forward and over output shaft (Fig. 75).

80c0710e

Fig. 75 Adapter Housing

- 1 - TRANSMISSION
2 - GASKET
3 - ADAPTER HOUSING

(4) Guide park shaft into park sprag and push adapter housing forward until rod passes through opening behind sprag. It may be necessary to use a wire to hold sprag to the side for rod to pass through.

(5) Install bolts to hold adapter housing to rear of transmission.

(6) Install transfer case.

(7) Install propeller shafts.

(8) Install rear transmission mount and skid plate.

(9) Lower vehicle and verify transmission fluid level. Add fluid as necessary.

SPEEDOMETER ADAPTER

Rear axle gear ratio and tire size determine speedometer pinion requirements.

REMOVAL

- (1) Raise vehicle.
- (2) Disconnect wires from vehicle speed sensor.
- (3) Remove adapter clamp and screw (Fig. 76).
- (4) Remove speed sensor and speedometer adapter as assembly.
- (5) Remove speed sensor retaining screw and remove sensor from adapter.
- (6) Remove speedometer pinion from adapter.
- (7) Inspect sensor and adapter O-rings (Fig. 76). Remove and discard O-rings if worn or damaged.
- (8) Inspect terminal pins in speed sensor. Clean pins with Mopar® electrical spray cleaner if dirty or oxidized. Replace sensor if faulty, or pins are loose, severely corroded, or damaged.

INSTALLATION

(1) Thoroughly clean adapter flange and adapter mounting surface in housing. Surfaces must be clean

REMOVAL AND INSTALLATION (Continued)

for proper adapter alignment and speedometer operation.

(2) Install new O-rings on speed sensor and speedometer adapter if necessary (Fig. 76).

(3) Lubricate sensor and adapter O-rings with transmission fluid.

(4) Install vehicle speed sensor in speedometer adapter. Tighten sensor attaching screw to 2-3 N·m (15-27 in. lbs.) torque.

(5) Install speedometer pinion in adapter.

(6) Count number of teeth on speedometer pinion. Do this before installing assembly in housing. Then lubricate pinion teeth with transmission fluid.

(7) Note index numbers on adapter body (Fig. 77). These numbers will correspond to number of teeth on pinion.

(8) Install speedometer assembly in housing.

(9) Rotate adapter until required range numbers are at 6 o'clock position. Be sure range index numbers correspond to number of teeth on pinion gear.

(10) Install speedometer adapter clamp and retaining screw. Tighten clamp screw to 10-12 N·m (90-110 in. lbs.) torque.

(11) Connect wires to vehicle speed sensor.

(12) Lower vehicle and top off transmission fluid level, if necessary.

J9321-386

Fig. 77 Index Numbers On Speedometer Pinion Adapter

- 1 - SPEEDOMETER ADAPTER
2 - INDEX NUMBER LOCATION

PARK/NEUTRAL POSITION SWITCH

REMOVAL

- (1) Raise vehicle and position drain pan under switch.
- (2) Disconnect switch wires.
- (3) Remove switch from case.

J9321-385

Fig. 76 Speedometer Pinion Adapter Components

- | | |
|-------------------------|--------------------------|
| 1 - SENSOR O-RING | 4 - SPEEDOMETER PINION |
| 2 - SPEEDOMETER ADAPTER | 5 - ADAPTER CLAMP |
| 3 - ADAPTER O-RING | 6 - VEHICLE SPEED SENSOR |

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Move shift lever to Park and Neutral positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 78).

Fig. 78 Park/Neutral Position Switch

- 1 - NEUTRAL CONTACT
- 2 - MANUAL LEVER AND SWITCH PLUNGER IN REVERSE POSITION
- 3 - PARK CONTACT
- 4 - SWITCH

(2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.

(3) Test continuity of new switch with 12V test lamp.

(4) Connect switch wires and lower vehicle.

(5) Top off transmission fluid level.

GEARSHIFT CABLE

REMOVAL

(1) Shift transmission into Park.

(2) Remove shift lever bezel and necessary console parts for access to shift lever assembly.

(3) Disconnect cable at shift lever and feed cable through dash panel opening to underside of vehicle.

(4) Raise vehicle.

(5) Disengage cable eyelet at transmission shift lever and pull cable adjuster out of mounting bracket. Then remove old cable from vehicle.

INSTALLATION

(1) Route cable through hole in dash panel. Fully seat cable grommet into dash panel.

(2) Place the auto transmission manual shift control lever in "Park" detent (rearmost) position and rotate prop shaft to ensure transmission is in park.

(3) Connect shift cable to shifter mechanism by snapping cable retaining ears into shifter bracket and press cable end fitting onto lever ball stud.

(4) Place the floor shifter lever in park position. Ensure that the pawl is seated within the confines of the adjustment gauge clip.

(5) Snap the cable into the transmission bracket so the retaining ears are engaged and connect cable end fitting onto the manual control lever ball stud.

(6) Lock shift cable into position by pushing upward on the adjusting lock button.

(7) Remove and discard the shift cable adjustment gauge clip from the park gate of the shifter.

BRAKE TRANSMISSION SHIFT INTERLOCK

REMOVAL

(1) Remove lower steering column cover. Refer to Group 8E, Instrument Panel and Gauges, for proper procedure.

(2) Remove lower steering column shroud. Refer to Group 19, Steering, for proper procedure.

(3) Remove tie strap near the solenoid retaining the brake transmission interlock cable to the steering column.

(4) Disengage wire connector from solenoid.

(5) With the ignition removed or in the unlocked position, disengage lock tab holding cable end to steering column (Fig. 79).

(6) Pull cable end from steering column.

(7) Remove the floor console and related trim. Refer to Group 23, Body, for proper procedure.

(8) Disconnect the cable eyelet from the bellcrank (Fig. 80).

Fig. 79 Brake/Park Interlock Cable

- 1 - IGNITION LOCK
- 2 - LOCK TAB
- 3 - CABLE END

(9) Disconnect and remove the cable from the shift bracket.

REMOVAL AND INSTALLATION (Continued)

80a13876

Fig. 80 Cable and Shifter

- 1 - SHIFT MECHANISM
- 2 - LOCK-TAB
- 3 - IGNITION LOCK INTERLOCK
- 4 - STEERING COLUMN
- 5 - SOLENOID
- 6 - WIRE CONNECTOR

- 7 - LEVER
- 8 - MOUNT BRACKET
- 9 - SHIFT CABLE
- 10 - AUTOMATIC TRANSMISSION
- 11 - TIE STRAP
- 12 - PARK/BRAKE INTERLOCK CABLE

INSTALLATION

(1) Route replacement cable behind instrument panel and under floor console area to shift mechanism (Fig. 80).

(2) Insert cable end into opening in steering column hub under ignition lock. Push cable inward until lock tab engages.

(3) Connect the cable end eyelet onto shifter bellcrank pin.

(4) Place gear selector in PARK.

(5) Push the spring-loaded cable adjuster forward and snap cable into bracket.

(6) Adjust the brake transmission shifter interlock cable. Refer to the Adjustment portion of this section for proper procedures.

(7) Verify that the cable adjuster lock clamp is pushed downward to the locked position.

(8) Test the park-lock cable operation.

(9) Install the floor console and related trim.

(10) Install tie strap to hold cable to base of steering column.

(11) Install lower steering column shroud and ignition lock.

(12) Install lower steering column cover.

VALVE BODY**REMOVAL**

(1) Raise vehicle.

(2) Remove oil pan and drain fluid.

(3) Loosen clamp bolts and remove throttle and manual valve levers from manual lever shaft.

(4) Remove park/neutral position switch.

(5) Remove filter from valve body.

(6) Depress retaining clip and pull solenoid wire from case connector (Fig. 81).

(7) Remove valve body attaching screws.

(8) Lower valve body enough to remove accumulator piston and piston spring (Fig. 82).

REMOVAL AND INSTALLATION (Continued)

**Fig. 81 Solenoid Wire Connector**

- 1 - PUSH CLIP IN
- 2 - PULL
- 3 - CONVERTER CLUTCH SOLENOID CONNECTOR

(9) Pull valve body forward to disengage park rod.
 (10) Push manual lever shaft and solenoid case connector out of transmission case.

(11) Lower valve body, rotate it away from case, pull park lock rod out of sprag, and remove valve body (Fig. 83).

**Fig. 82 Accumulator Piston And Springs**

- 1 - ACCUMULATOR PISTON
- 2 - OUTER SPRING
- 3 - PISTON SEAL RINGS
- 4 - INNER SPRING (32RH)

INSTALLATION

(1) Verify that park/neutral position switch is **NOT** installed. Valve body cannot be installed with switch in place. Remove switch if necessary.

(2) Install new seals on accumulator piston if necessary, and install piston in case. Use small amount of petroleum jelly to hold piston in place.

(3) Place valve body manual lever in low (1 position) to ease inserting park rod into sprag.

**Fig. 83 Valve Body**

- 1 - VALVE BODY
- 2 - CONVERTER CLUTCH MODULE
- 3 - SOLENOID
- 4 - PARK ROD
- 5 - CONVERTER CLUTCH SOLENOID CONNECTOR
- 6 - MANUAL VALVE
- 7 - MANUAL LEVER

(4) Use screwdriver to push park sprag into engagement with park gear. This makes clearance for knob on lock rod to move past sprag when valve body is installed. Rotate output shaft to verify sprag engagement.

(5) Position accumulator spring between accumulator piston and valve body.

(6) Position valve body on transmission and work knob on park lock rod past sprag. Be sure accumulator piston and spring remain in position.

(7) Hold valve body in position and install valve body screws finger tight.

(8) Install park/neutral position switch.

(9) Tighten valve body screws alternately and evenly to 11 N·m (100 in. lbs.) torque.

(10) Install new fluid filter on valve body. Install and tighten filter screws to 4 N·m (35 in. lbs.) torque.

(11) Connect solenoid wire to case connector.

(12) Install manual and throttle levers on throttle lever shaft. Tighten lever clamp screws and check for free operation. Shaft and levers must operate freely without any bind.

(13) Install oil pan and new gasket. Tighten pan bolts to 17 N·m (150 in. lbs.) torque. Install gasket dry; do not use sealer.

(14) Connect park/neutral position switch and converter clutch solenoid wires.

(15) Install speedometer pinion gear, adapter and speed sensor.

(16) Lower vehicle.

REMOVAL AND INSTALLATION (Continued)

(17) Fill transmission with Mopar® ATF Plus 3, Type 7176 fluid.

(18) Adjust gearshift and throttle cable if necessary.

OUTPUT SHAFT REAR BEARING

REMOVAL

(1) Remove extension housing.

(2) Remove snap ring that retains rear bearing on output shaft (Fig. 84).

(3) Remove bearing from output shaft.

INSTALLATION

(1) Install bearing on output shaft. Be sure retaining ring groove in outer circumference of bearing is toward the governor.

(2) Install rear bearing retaining snap ring (Fig. 84).

(3) Install extension housing.

Fig. 84 Output Shaft Rear Bearing—Typical

- 1 - BEARING SNAP RING GROOVE
- 2 - PARK LOCK CONTROL ROD
- 3 - REAR SNAP RING

GOVERNOR AND PARK GEAR

REMOVAL

(1) Hoist and support vehicle on safety stands.

(2) Mark propeller shaft and axle yoke for assembly reference. Then disconnect and remove shaft.

(3) Disconnect parking brake cable at equalizer and disconnect exhaust components as necessary.

(4) Support transmission on a suitable lifting device.

(5) Remove skid plate and rear transmission mount.

(6) Remove extension housing.

(7) Loosen but do not remove bolts that hold governor body to park gear.

(8) Rotate transmission output shaft until governor weight assembly is accessible.

(9) Remove E-clip at end of governor valve shaft (Fig. 85).

Fig. 85 Governor Valve

- 1 - E-CLIP
- 2 - PARK GEAR
- 3 - CURVER BOSS
- 4 - GOVERNOR VALVE
- 5 - GOVERNOR

(10) Remove governor valve and shaft from governor body (Fig. 85).

(11) Remove snap rings and spacer that retain governor body and park gear assembly on output shaft (Fig. 86).

(12) Remove bolts holding governor body to park gear (Fig. 87).

(13) Separate governor from park gear.

(14) Pull park gear from rear support.

Fig. 86 Snap Rings And Spacer

- 1 - GOVERNOR BODY
- 2 - THIN SNAP RING
- 3 - THRUST WASHER
- 4 - THICK SNAP RING

REMOVAL AND INSTALLATION (Continued)

**Fig. 87 Governor Body**

- 1 - GOVERNOR/PARK ASSEMBLY
- 2 - GOVERNOR VALVE SHAFT BORE
- 3 - REAR SUPPORT
- 4 - OUTPUT SHAFT SPLINES
- 5 - SEAL RINGS

INSTALLATION

- (1) Install park gear into rear support so crown on curved boss is in line with hole through output shaft.
- (2) Install governor filter in park gear.
- (3) Slip governor body over output shaft and align port to filter.
- (4) Install bolts to hold governor body to park gear. Tighten bolts to 11 N·m (95 in. lbs.) torque (Fig. 87).
- (5) Install governor body-park gear snap rings and washer on output shaft as follows:
 - (a) Install thin snap ring first. Then install thrust washer second, and thick snap ring last (Fig. 86).
 - (b) Verify correct position of snap rings. **Be sure flat side of each snap ring is toward governor body.**
- (6) Insert governor valve and shaft through governor and install E-clip (Fig. 85).
- (7) Install extension housing and gasket on transmission. Tighten housing bolts to 32 N·m (24 ft. lbs.).
- (8) Install rear transmission mount and skid plate.
- (9) Install speed sensor and speedometer components and connect speed sensor wires.
- (10) Connect exhaust components and brake cable, if removed.
- (11) Install propeller shaft.
- (12) Remove supports and lower vehicle.
- (13) Check transmission fluid level. Add fluid if necessary.

PARK LOCK**REMOVAL**

- (1) Raise vehicle and remove propeller shaft.
- (2) Remove extension housing.
- (3) Slide sprag shaft out of extension housing and remove sprag and spring (Fig. 88).
- (4) Remove snap ring and slide reaction plug and pin assembly out of housing.
- (5) If park rod requires service, it will be necessary to remove valve body.

INSTALLATION

- (1) Inspect sprag shaft for scores and free movement in housing and sprag. Inspect sprag and control rod springs for distortion and loss of tension. replace worn, damaged parts as necessary.
- (2) Inspect square lug on sprag for broken edges. Check lugs on park gear for damage. Inspect knob on end of control rod for wear grooves, or being seized on rod. Replace rod if bent, if knob is worn/grooved, or it has seized on rod. Replace park gear if lugs are damaged. Replace the park lock rod if it is suspected that the rod is not the correct length.
- (3) Install reaction plug and pin assembly in housing and secure with new snap ring (Fig. 88).
- (4) Position sprag and spring in housing and insert sprag shaft. Be sure square lug on sprag is toward park gear. Also be sure spring is positioned so it moves sprag away from gear.
- (5) Install extension housing.
- (6) Install propeller shaft and lower vehicle.
- (7) Check transmission fluid level. Add fluid if necessary.

DISASSEMBLY AND ASSEMBLY**GOVERNOR AND PARK GEAR****DISASSEMBLY**

- (1) Remove governor body from transmission.
- (2) Clean and inspect governor filter (Fig. 89).
- (3) Remove snap ring and washer that secure governor weight assembly in body (Fig. 90).
- (4) Remove governor weight assembly from governor body bore.
- (5) Slide intermediate and inner weight from outer weight.
- (6) Position intermediate weight on suitable size socket (Fig. 91).
- (7) Push inner weight downward with nut driver. Then remove inner weight snap ring with Miller Plier Tool 6823 (Fig. 91).
- (8) Remove inner weight and spring from intermediate weight.

- 2 - PARK GEAR

ASSEMBLY

CAUTION: Exercise care when installing the rings. They are easily broken if overspread or twisted during installation.

If it was necessary to remove the park gear, inspect the seal rings and bore in rear support.

J9521-33

Fig. 91 Inner Weight Snap Ring

DISASSEMBLY AND ASSEMBLY (Continued)

80a47367

Fig. 92 Intermediate and Inner Governor Weights

- 1 - INTERMEDIATE WEIGHT
2 - INNER WEIGHT
3 - SNAP-RING

Install new seal rings on park gear hub only if original rings are damaged, or worn. Install ring with interlock ends first and ring with plain ends last. Slip each ring on hub and seat them in grooves. Verify that rear ring ends are securely interlocked before proceeding. If the bore in rear support is damaged, replace the rear support.

(1) Lubricate governor components with Mopar® ATF Plus 3, Type 7176 transmission fluid before assembly.

(2) Clean and inspect governor weights and bores for scoring or wear. Replace the governor body and weights if damaged. Refer to Cleaning and Inspection section of this group for proper procedure.

(3) Insert spring into intermediate weight.

(4) Insert inner weight into intermediate weight and install snap-ring (Fig. 92). Verify snap-ring is fully seated in groove in intermediate weight (Fig. 91).

(5) Assemble governor weights into governor body (Fig. 90).

(6) Install washer and snap ring to hold weights in governor body.

(7) Install governor body in transmission

VALVE BODY**DISASSEMBLY**

Position the valve body on a clean work surface to avoid contamination.

CAUTION: Do not clamp any part of the valve body assembly (Fig. 93) in a vise. This practice will distort the valve body and transfer plate resulting in valve bind. Slide valves and plugs out carefully. Do not use force at any time. The valves and valve

body will be damaged if force is used. Also tag or mark the valve body springs for reference as they are removed. Do not allow them to become inter-mixed.

(1) Remove screws attaching adjusting screw bracket to valve body and transfer plate. Hold bracket firmly against spring force while removing last screw.

(2) Remove adjusting screw bracket, line pressure adjusting screw (Fig. 94).

(3) Remove switch valve and spring, pressure regulator valve and spring, kickdown valve and spring, and throttle valve from valve body (Fig. 94).

(4) Secure detent ball and spring in housing with Retainer Tool 6583 (Fig. 95).

(5) Remove manual shaft E-clip, washer, and seal (Fig. 96).

(6) Pull manual shaft and park rod assembly upward out of valve body and off throttle lever (Fig. 96).

(7) Remove manual valve from valve body (Fig. 97)

(8) Remove Retainer Tool 6583. Then remove and retain detent ball and spring (Fig. 96).

(9) Remove throttle lever (Fig. 96).

80a3b19f

- 2 - VALVE BODY

(11) Remove converter clutch solenoid from separator plate (Fig. 99). A T25 torx bit is required to remove solenoid attaching screw.

(12) Remove screws attaching converter clutch module to valve body and remove module and connecting tube (Fig. 100).

(13) Remove screws attaching end cover plate to torque converter module (Fig. 101).

(14) Remove converter clutch valve, fail safe valve, and springs (Fig. 101)

(15) Turn valve body over so transfer plate is facing upward (Fig. 102). With valve body in this position, valve body check balls will remain in place and not fall out when transfer plate is removed.

(16) Remove screws attaching transfer plate to valve body (Fig. 102).

(17) Remove transfer plate and separator plate from valve body (Fig. 102). Note position of filter and clutch solenoid for reference. Remove valve body check balls.

DISASSEMBLY AND ASSEMBLY (Continued)

(18) Position transfer plate on bench so separator plate, and filter are facing up. This will avoid having rear clutch and rear servo check balls fall out when plates are separated.

- (23) Remove governor plug end plate (Fig. 107).
- (24) Remove 1-2 and 2-3 shift valve governor plugs from valve body (Fig. 107).
- (25) Remove shuttle valve throttle plug, primary spring and shuttle valve from valve body (Fig. 107).
- (26) Remove screws attaching kickdown limit valve body to valve body (Fig. 107).
- (27) Remove 1-2 shift control valve and spring from valve body (Fig. 107).
- (28) Remove 2-3 shift valve and spring from valve body (Fig. 107).
- (29) Remove 1-2 shift valve and spring from valve body (Fig. 107).
- (30) Remove throttle pressure plug from kickdown limit valve body (Fig. 107).

- (31) Remove retainer from end of kickdown limit valve body (Fig. 107).
- (32) Remove kickdown limit valve and spring from kickdown limit valve body (Fig. 107).
- (33) Remove regulator valve end plate from valve body (Fig. 107).
- (34) Remove regulator valve line pressure plug, pressure plug sleeve, regulator valve throttle pressure plug and spring (Fig. 107).

ASSEMBLY

Clean and inspect all valve body components for damage or wear. Refer to the Cleaning and Inspection section of this group for proper procedure.

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 107 Control Valves, Shift Valves, And Governor Plugs**

80a13872

- | | |
|--|----------------------------------|

| 7 - LINE PRESSURE PLUG | 17 - GUIDES |
| 8 - RETAINER | 18 - 2-3 GOVERNOR PLUG |
| 9 - 1-2 SHIFT VALVE | 19 - PRIMARY SPRING |
| 10 - 1-2 SHIFT CONTROL VALVE | 20 - SHUTTLE VALVE THROTTLE PLUG |

CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves, and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the valve body resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.

(1) Lubricate valve body bores, valves and plugs with Mopar® ATF Plus 3, Type 7176, transmission fluid.

(2) Install regulator valve line pressure plug, pressure plug sleeve, regulator valve throttle pressure plug, and spring into valve body (Fig. 107). Verify valve components slide freely.

(3) Install regulator valve end plate on valve body (Fig. 107).

(4) Install kickdown limit valve and spring in kickdown limit valve body (Fig. 107). Verify valve components slide freely.

(5) Compress spring into kickdown limit valve body.

(6) Install retainer in grooves at end of kickdown limit valve body (Fig. 107).

(7) Install throttle pressure plug in kickdown limit valve body (Fig. 107).

(8) Install 1-2 shift valve and spring into valve body (Fig. 107).

(9) Install 2-3 shift valve and spring into valve body (Fig. 107).

(10) Install 1-2 shift control valve and spring into valve body (Fig. 107).

(11) Verify valve components slide freely.

DISASSEMBLY AND ASSEMBLY (Continued)

(12) Place kickdown limit valve body and end plate in position on valve body and compress springs (Fig. 107).

(13) Install screws to attach kickdown limit valve body to valve body (Fig. 107).

(14) Install shuttle valve throttle plug, primary spring and shuttle valve into valve body (Fig. 107). Verify valve components slide freely.

(15) Install 1-2 and 2-3 shift valve governor plugs into valve body (Fig. 107). Verify valve components slide freely.

(16) Place governor plug end plate in position on valve body and compress spring.

(17) Install screws to attach governor plug end plate to valve body (Fig. 107).

(18) Assemble shuttle valve spring and guides (Fig. 107). Place spring and guides in position on shuttle valve stem.

(19) Compress spring and install E-clip in groove on shuttle valve stem (Fig. 108).

(20) Place shuttle valve end plate in position on valve body (Fig. 109).

(21) Install screws to attach shuttle valve end plate to valve body (Fig. 109).

Fig. 108 Shuttle Valve E-Clip And Secondary Spring

- 1 - E-CLIP
- 2 - SECONDARY SPRING AND GUIDES
- 3 - SHUTTLE VALVE

(22) Install rear clutch servo and rear servo check balls in proper cavities in transfer plate (Fig. 110).

(23) Insert filter into opening in separator plate (Fig. 111).

(24) Place separator plate in position on transfer plate and install screws to attach separator plate to transfer plate (Fig. 111).

(25) Place one 11/32 in. check ball and six 1/4 in. check balls in the proper cavities in the valve body (Fig. 112).

Fig. 109 Shuttle Valve End Plate

- 1 - VALVE BODY
- 2 - SHUTTLE VALVE END PLATE

Fig. 110 Rear Servo and Rear Clutch Check Balls

- 1 - REAR SERVO CHECK BALL
- 2 - TRANSFER PLATE
- 3 - REAR CLUTCH CHECK BALL

(26) Place transfer plate in position on valve body (Fig. 113).

(27) Install screws to attach transfer plate to valve body (Fig. 113).

(28) Turn valve body over to expose the separator plate.

(29) Insert converter clutch valve and spring into converter clutch valve module (Fig. 114). Verify valve components slide freely.

(30) Insert spring and fail-safe valve into converter clutch valve module (Fig. 114). Verify valve components slide freely.

(31) Place cover plate in position on converter clutch valve module (Fig. 114).

(32) Install screws to attach cover to converter clutch valve module (Fig. 114).

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 111 Transfer And Separator Plates**

- 1 - SEPARATOR PLATE

- 2 - 11/32" CHECK BALL (1)

(33) Insert connecting tube into converter clutch valve module (Fig. 114).

(34) Insert connecting tube into valve body opening (Fig. 115).

(35) Place converter clutch valve module in position on separator plate. Install screws to attach converter clutch module to valve body (Fig. 115).

(36) If necessary, install a new O-ring on converter clutch solenoid (Fig. 116).

**Fig. 115 Clutch Module And Connecting Tube**

- 1 - MODULE AND CONNECTING TUBE

(37) Insert converter clutch solenoid into transfer plate (Fig. 116).

(38) Install screw to attach solenoid to transfer plate (Fig. 116).

(39) If necessary, insert park rod end into manual lever and install E-clip (Fig. 117).

(40) Insert detent spring and ball into opening in valve body and install Retainer Tool 6583 (Fig. 118).

(41) Install manual valve into valve body (Fig. 119).

(42) Insert throttle lever through transfer plate side of valve body and upward (Fig. 120).

(43) Insert throttle lever into groove in manual valve (Fig. 121).

(44) Install seal, washer, and E-clip to retain manual shaft to valve body (Fig. 120).

(45) Install switch valve and spring, pressure regulator valve and spring, kickdown valve and spring, and throttle valve into valve body (Fig. 122).

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 116 Converter Clutch Solenoid**

- 1 - VALVE BODY
2 - TORQUE CONVERTER CLUTCH SOLENOID

(46) Place adjusting screw bracket and line pressure adjusting screw in position on valve body and compress springs (Fig. 94).

(47) Install screws to attach adjuster bracket to valve body.

TRANSMISSION

DISASSEMBLY

- (1) Remove transmission from vehicle.

**Fig. 113 Valve Body Transfer Plate Screws**

- 1 - TRANSFER PLATE
2 - VALVE BODY
3 - SEPARATOR PLATE

**Fig. 117 Park Rod**

- 1 - MANUAL LEVER
2 - E-CLIP
3 - PARK ROD

**Fig. 118 Securing Detent Ball And Spring With Retainer Tool**

- 1 - SPECIAL TOOL 6583
2 - DETENT BALL AND SPRING HOUSING

(2) Install a suitable tail shaft housing plug to avoid contaminating internal components with cleaning solvents.

(3) Clean exterior of transmission with suitable solvent or pressure washer.

(4) Remove torque converter from transmission.

(5) Remove throttle and shift levers from valve body manual shaft and throttle lever shaft.

(6) Mount transmission in repair stand C-3750-B or similar type stand (Fig. 123).

(7) Remove extension housing.

(8) Remove fluid pan.

(9) Remove park/neutral position switch and seal (Fig. 124).

(10) Remove valve body.

(11) Remove accumulator spring and piston (Fig. 125).

(12) Loosen front band adjusting screw lock nut (Fig. 126) 4-5 turns. Then tighten band adjusting

DISASSEMBLY AND ASSEMBLY (Continued)

(18) Remove front and rear clutch units as an assembly. Grasp input shaft, hold clutch units together and remove them from case (Fig. 129).

(19) Lift front clutch off rear clutch (Fig. 130). Set clutch units aside for overhaul.

(20) Remove output shaft thrust washer from output shaft (or from rear clutch hub) (Fig. 131).

(21) Remove output shaft thrust plate and washer from output shaft hub (Fig. 131).

(22) Remove front band from case (Fig. 132).

(23) Remove extension housing from transmission case.

**Fig. 129 Front/Rear Clutch Assemblies**

- 1 - FRONT BAND
- 2 - FRONT CLUTCH AND DRUM
- 3 - TRANSMISSION HOUSING
- 4 - REAR CLUTCH

(24) Remove governor body and park gear from output shaft.

(25) Remove output shaft and planetary geartrain as assembly (Fig. 133). Support geartrain with both hands during removal. Do not allow machined surfaces on output shaft to become nicked or scratched.

(34) Compress front servo rod guide about 1/8 in. with large C-clamp and Tool C-4470, or Spring Compressor Tool C-3422-B (Fig. 144).

(35) Remove front servo rod guide snap ring (Fig. 144). **Exercise caution when removing snap ring. Servo bore can be scratched or nicked if care is not exercised.**

(36) Remove compressor tools and remove front servo rod guide, spring and servo piston.

(37) Compress rear servo spring retainer about 1/16 in. with C-clamp and Tool C-4470 or SP-5560 (Fig. 145). Valve Spring Compressor C-3422-B can also be used to compress spring retainer.

(38) Remove rear servo spring retainer snap ring. Then remove compressor tools and remove rear servo spring and piston.

**Fig. 144 Compressing Front Servo**

- 1 - SPRING COMPRESSOR TOOL C-3422-B
2 - ROD GUIDE SNAP RING

ASSEMBLY

(1) Install rear servo piston, spring and spring retainer. Compress rear servo spring and retainer with Compressor Tool C-3422-B (Fig. 145) or a large C-clamp.

(2) Install front servo piston, spring, and rod guide. Compress front servo rod guide with Valve Spring Compressor C-3422-B and install servo snap ring (Fig. 144).

(3) Assemble link bar to band. Notched side of link toward band (Fig. 143).

(4) Insert rear band through pan opening in transmission case.

(5) Insert hook on band onto adjuster lever.

(6) Align holes in link bar with hole in transmission case outboard of rear support opening (Fig. 142).

(7) Insert anchor pin into case through link bar.

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 145 Compressing Rear Servo Spring**

- 1 - LARGE C-CLAMP
- 2 - TOOL C-4470 OR SP5560
- 3 - SERVO SPRING RETAINER

(8) Examine bolt holes in overrunning clutch cam. Note that one hole is **not threaded** (Fig. 146). This hole must align with blank area in clutch cam bolt circle.

NOTE: The bolt holes in cam are slightly countersunk on one side. This side of cam faces rearward (toward rear support).

(9) Lubricate overrunning clutch rollers, springs and cam with Mopar® ATF Plus 3, type 7176, transmission fluid.

(10) Position overrunning clutch on a clean, flat work surface with countersunk holes downward.

(11) Place rear of low-reverse drum over overrunning clutch and align clutch rollers to hub of drum.

(12) While slightly pivoting low-reverse drum, push hub of drum into overrunning clutch. Verify that countersunk holes are facing outward. **Cam should be able to rotate in the drum clockwise only.**

(13) Insert a suitable awl through the rear support mounting hole closest to the pan sealing face. The awl should be next to the wide space area at the back of transmission case.

(14) Insert low-reverse drum and overrunning clutch into front of transmission case and into rear band.

(15) Insert awl tip into the threaded hole next to the non-threaded hole in the overrunning clutch cam. Verify that non-threaded hole is aligned with wide space area on transmission case.

(16) Push low-reverse drum rearward to close gap between cam and case.

(17) Install overrunning clutch cam bolts. **Clutch cam bolts are shorter than rear support bolts.** Tighten cam bolts to 17 N·m (150 in. lbs. or 13 ft. lbs.) torque.

**Fig. 146 Clutch Cam Alignment**

- 1 - TRANSMISSION CASE
- 2 - OVERRUNNING CLUTCH
- 3 - NON-THREADER HOLE
- 4 - WIDE SPACE AREA

(18) Hold low-reverse drum in position so rear support will not push it out of overrunning clutch.

(19) Insert rear support into opening at rear of transmission case (Fig. 147).

(20) Align support with the embossed arrow in the direction of the pan face.

**Fig. 147 Rear Support**

- 1 - OIL PAN FACE
- 2 - TRANSMISSION HOUSING
- 3 - REAR SUPPORT

DISASSEMBLY AND ASSEMBLY (Continued)

(21) Install and tighten rear support bolts to 17 N·m (150 in. lbs.) torque.

(22) Install snap ring to retain low-reverse drum to hub of rear support (Fig. 148).

Fig. 148 Low-Reverse Drum Snap Ring

- 1 - REAR BAND
- 2 - REAR SUPPORT HUB
- 3 - LOW-REVERSE DRUM SNAP RING
- 4 - LOW-REVERSE DRUM

(23) Lubricate output shaft, rear support bore and low-reverse drum hub with transmission fluid.

(24) Install assembled output shaft and planetary geartrain in case (Fig. 149).

(25) Align drive lugs on rear planetary gear with slots in low-reverse drum (Fig. 149). Then seat planetary assembly in drum.

(26) Install governor on output shaft.

Fig. 149 Output Shaft And Planetary Geartrain

- 1 - SLOTS
- 2 - LOW-REVERSE DRUM
- 3 - PLANETARY GEARTRAIN
- 4 - TRANSMISSION HOUSING
- 5 - LUGS

(27) Turn and secure transmission so that front opening is upward.

(28) Assemble front and rear clutches together.

(a) Check input shaft seal rings (Fig. 150). Verify that diagonal-cut ends of Teflon™ seal ring are properly joined and ends of metal ring are correctly hooked together. Also be sure rings are installed in sequence shown.

(b) Align teeth on clutch discs in line.

(c) Insert input shaft on rear clutch into center of front clutch (Fig. 151).

(d) Engage teeth on rear clutch hub into teeth on clutch (Fig. 153). Rotate front clutch retainer back and forth until completely seated on rear clutch.

Fig. 150 Input Shaft Seal Ring Location

- 3 - FRONT CLUTCH

DISASSEMBLY AND ASSEMBLY (Continued)

(29) Install output shaft thrust plate on shaft hub in planetary geartrain driving shell (Fig. 152). Use petroleum jelly to hold thrust plate in place.

(30) Check rear clutch thrust washer. Use additional petroleum jelly to hold washer in place if necessary.

(31) Coat output shaft thrust washer with petroleum jelly. Install washer in rear clutch hub (Fig. 154). Use enough petroleum jelly to hold washer in place. **Be sure grooved side of washer faces rearward (toward output shaft) as shown. Also note that washer only fits one way in clutch hub.**

Fig. 152 Output Shaft Thrust Plate

- 1 - OUTPUT SHAFT HUB
- 2 - OUTPUT SHAFT THRUST PLATE

Fig. 153 Assembling Front And Rear Clutch Units

- 1 - TURN FRONT CLUTCH BACK & FORTH UNTIL SEATED
- 2 - REAR CLUTCH ASSEMBLY

(32) Align drive teeth on rear clutch discs with small screwdriver (Fig. 155). This will make installation into front of planetary geartrain easier.

Fig. 154 Output Shaft Thrust Washer

- 1 - REAR CLUTCH HUB
- 2 - OUTPUT SHAFT THRUST WASHER
- 3 - OUTPUT SHAFT

Fig. 155 Aligning Rear Clutch Disc Lugs

- 1 - REAR CLUTCH DISCS
- 2 - USE SMALL SCREWDRIVER TO ALIGN CLUTCH DISC TEETH

(33) Insert front band into opening at front of transmission case (Fig. 156).

(34) Install front and rear clutch units as assembly (Fig. 157). Align rear clutch with front annulus gear and install assembly in driving shell. **Be sure output shaft thrust washer and thrust plate are not displaced during installation.**

(35) Carefully work assembled clutches back and forth to engage and seat rear clutch discs on front annulus gear. Verify that front clutch drive lugs are

DISASSEMBLY AND ASSEMBLY (Continued)

fully engaged in slots of driving shell after installation.

Fig. 156 Front Band

- 1 - FRONT BAND
- 2 - TRANSMISSION HOUSING

Fig. 157 Installing Front/Rear Clutch

- 1 - FRONT BAND
- 2 - FRONT CLUTCH AND DRUM
- 3 - TRANSMISSION HOUSING
- 4 - REAR CLUTCH

(36) Engage front band on adjusting screw and hold band in place.

(37) Install strut between band lever and front band (Fig. 158).

(38) Tighten front band adjusting screw until band just grips clutch retainer. Verify that front/rear clutches are still seated before continuing.

(39) Verify that reaction shaft support hub seal rings are hooked together (Fig. 159).

(40) Coat front clutch thrust washer with petroleum jelly to hold it in place. Then install washer

over reaction shaft hub and seat it on pump (Fig. 160).

CAUTION: The thrust washer bore (I. D.), is chamfered on one side. Make sure the chamfered side is installed so it faces the pump.

Fig. 158 Front Band Linkage Installation

(41) Thread two Pilot Stud Tools C-3288-B into bolt holes in oil pump flange (Fig. 161).

(42) Align and install oil pump gasket (Fig. 161).

(43) Lubricate oil pump seals with Mopar® Door-Ease, or Ru-Glyde, Door Eze, or ATF Plus 3.

(44) Install oil pump (Fig. 162). Align and position pump on pilot studs. Slide pump down studs and work it into front clutch hub and case by hand. Then install two or three pump bolts to hold pump in place.

(45) Remove pilot stud tools and install remaining oil pump bolts. Tighten bolts alternately in diagonal pattern to 20 N·m (15 ft. lbs.).

**Fig. 161 Installing Pilot Studs And Oil Pump Gasket**

- 1 - OIL PUMP GASKET
- 2 - PILOT STUD TOOLS C-3288-B

**Fig. 162 Installing Oil Pump And Reaction Shaft Support**

- 1 - OIL PUMP
- 2 - PILOT STUD TOOL
- 3 - PILOT STUD TOOL

(46) Measure input shaft end play (Fig. 163).

NOTE: If end play is incorrect, transmission is incorrectly assembled, or output shaft thrust washer and/or thrust plate are worn and need to be changed.

(a) Attach Adapter 8266-7 to Handle 8266-8.

(b) Attach dial indicator C-3339 to Handle 8266-8.

(c) Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-7 to secure it to the input shaft.

(d) Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

(e) Move input shaft in and out and record reading. End play should be 0.56 - 2.31 mm (0.022 - 0.091 in.).

(47) Position transmission on work surface with pan face upward.

(48) Install valve body.

(49) Adjust front and rear bands.

(50) Install fluid filter and pan.

(51) Install rear extension housing.

(52) Install torque converter.

DISASSEMBLY AND ASSEMBLY (Continued)

OVERRUNNING CLUTCH/LOW-REVERSE DRUM

DISASSEMBLY

(1) If the clutch assembly came out with the low-reverse drum, thread two clutch cam bolts into the cam. Then lift the cam out of the drum with the bolts (Fig. 164). Rotate the cam back and forth to ease removal if necessary.

J9121-224

Fig. 164 Removing Overrunning Clutch From Low-Reverse Drum

- 1 - CAM BOLTS
- 2 - LOW-REVERSE DRUM
- 3 - OVERRUNNING CLUTCH AND CAM

(2) Remove the clutch roller and spring assembly from the overrunning clutch race.

ASSEMBLY

(1) Assemble clutch rollers and springs in retainer if necessary (Fig. 165).

(2) Install overrunning clutch roller, spring and retainer assembly in clutch cam (Fig. 166).

(3) Temporarily assemble and check overrunning clutch operation as follows:

(a) Assemble cam and clutch.

J9121-139

Fig. 165 Overrunning Clutch Rollers, Springs, Retainer

- 1 - RETAINER
- 2 - SPRING
- 3 - ROLLER

J9121-138

Fig. 166 Assembling Overrunning Clutch And Cam

- 1 - CLUTCH CAM
- 2 - CLUTCH ROLL ASSEMBLY

DISASSEMBLY AND ASSEMBLY (Continued)

(b) Install clutch assembly on low-reverse drum with twisting motion (Fig. 167).

(c) Install drum-clutch assembly in case and install clutch cam bolts.

(d) Install rear support and support attaching bolts.

(e) Check low-reverse drum rotation. **Drum should rotate freely in clockwise direction and lock when turned in counterclockwise direction (as viewed from front of case).**

J9121-135

Fig. 167 Temporary Assembly Of Clutch And Drum To Check Operation

- 3 - OVERRUNNING CLUTCH

FRONT SERVO PISTON

DISASSEMBLY

- (1) Remove seal ring from rod guide (Fig. 169).
- (2) Remove small snap ring from servo piston rod. Then remove piston rod, spring and washer from piston.
- (3) Remove and discard servo component O-ring and seal rings.

ASSEMBLY

- (1) Lubricate new O-ring and seal rings with petroleum jelly and install them on piston, guide and rod.
- (2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap ring (Fig. 169).
- (3) Set servo components aside for installation during transmission reassembly.

DISASSEMBLY AND ASSEMBLY (Continued)

REAR SERVO PISTON

DISASSEMBLY

- (1) Remove small snap ring and remove plug and spring from servo piston (Fig. 170).
- (2) Remove and discard servo piston seal ring.

ASSEMBLY

- (1) Lubricate piston and guide seals with petroleum jelly. Lubricate other servo parts with Mopar® ATF Plus 3, Type 7176, transmission fluid.
- (2) Install new seal ring on servo piston.
- (3) Assemble piston, plug, spring and new snap ring.
- (4) Lubricate piston seal lip with petroleum jelly.

**Fig. 170 Rear Servo Components**

OIL PUMP AND REACTION SHAFT SUPPORT

DISASSEMBLY

- (1) Remove seal ring from housing and reaction shaft support (Fig. 171).

**Fig. 171 Removing Pump Seal Ring**

- 1 - PUMP HOUSING SEAL RING

- (2) Mark pump housing and support assembly for alignment reference.

- (3) Remove bolts attaching pump body to support (Fig. 172).

**Fig. 172 Pump Support Bolts**

- 1 - REACTION SHAFT SUPPORT
- 2 - PUMP

- (4) Separate support from pump housing (Fig. 173).

- (5) Remove inner and outer gears from reaction shaft support (Fig. 174).

- (6) If pump seal was not removed during transmission disassembly, remove seal with punch and hammer.

- (7) Remove front clutch thrust washer from support hub (Fig. 175).

**Fig. 173 Separating Pump Housing From Reaction Shaft Support**

- 2 - INNER GEAR
- 3 - OUTER GEAR

**Fig. 175 Support Hub Thrust Washer**

- 1 - BUSHING
- 2 - REACTION SHAFT SUPPORT
- 3 - THRUST WASHER
- 4 - HUB

OIL PUMP BUSHING REPLACEMENT

(1) Remove pump bushing with Tool Handle C-4171 and Bushing Remover SP-3551 from Tool Set C-3887-J (Fig. 176).

(2) Install new pump bushing with Tool Handle C-4171 and Bushing Installer SP-5117 (Fig. 176). Bushing should be flush with pump housing bore.

(3) Stake new pump bushing in two places with blunt punch (Fig. 177). Remove burrs from stake points with knife blade afterward.

REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Bushing Remover Tools SP-1191, 3633 and 5324 (Fig. 178). **Do not clamp any part of reaction shaft or support in vise.**

(2) Hold Cup Tool SP-3633 firmly against reaction shaft and thread remover SP-5324 into bushing as

**Fig. 176 Removing Oil Pump Bushing**

- 1 - SPECIAL TOOL C-4171
- 2 - SPECIAL TOOL SP-3551

- 2 - BLUNT PUNCH
- 3 - TWO STAKES

far as possible by hand. Then thread remover tool 3-4 additional turns into bushing with a wrench.

(3) Turn remover tool hex nut down against remover cup to pull bushing from shaft. Clean all chips from shaft after bushing removal.

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Lightly grip old bushing in vise or with pliers and back remover tool out of bushing.

(5) Assemble Bushing Installer Tools C-4171 and SP-5325 (Fig. 178).

(6) Slide new bushing onto Installer Tool SP-5325.

(7) Position reaction shaft support upright on a clean smooth surface.

(8) Align bushing in bore. Then tap bushing into place until Bushing Installer SP-5325 bottoms.

(9) Clean reaction shaft support thoroughly after installing bushing.

Fig. 178 Replacing Reaction Shaft Support Bushing

- 1 - SPECIAL TOOL SP-1191
- 2 - SPECIAL TOOL SP-3633
- 3 - SPECIAL TOOL C-4171
- 4 - SPECIAL TOOL SP-5325
- 5 - REACTION SHAFT
- 6 - SPECIAL TOOL SP-5324
- 7 - BUSHING

ASSEMBLY

(1) Lubricate gear bore in pump housing with transmission fluid.

(2) Lubricate pump gears with transmission fluid.

(3) Support pump housing on wood blocks (Fig. 179).

(4) Install outer gear in pump housing (Fig. 179). Gear can be installed either way (it is not a one-way fit).

(5) Install pump inner gear (Fig. 180).

CAUTION: The pump inner gear is a one way fit. The bore on one side of the gear inside diameter (I. D.) is chamfered. Be sure the chamfered side faces forward (to front of pump).

(6) Install new thrust washer on hub of reaction shaft support. Lubricate washer with transmission fluid or petroleum jelly.

(7) If reaction shaft seal rings are being replaced, install new seal rings on support hub (Fig. 181).

J9321-219

Fig. 179 Supporting Pump And Installing Outer Gear

- 1 - OUTER GEAR
- 2 - PUMP HOUSING
- 3 - WOOD BLOCKS

J9321-465

Fig. 180 Pump Inner Gear Installation

- 1 - OUTER GEAR
- 2 - INNER GEAR

Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.

(8) Install reaction shaft support on pump housing (Fig. 182).

(9) Align reaction support on pump housing. Use alignment marks made at disassembly. Or, rotate support until bolt holes in support and pump housing are all aligned (holes are offset for one-way fit).

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 181 Hub Seal Ring Position**

- 1 - SEAL RINGS
2 - SUPPORT HUB

**Fig. 183 Pump Oil Seal Installation**

- 1 - PUMP BODY
2 - PUMP SEAL
3 - SPECIAL TOOL C-4193

**Fig. 182 Assembling Reaction Shaft Support And Pump Housing**

- 1 - PUMP HOUSING
2 - REACTION SHAFT SUPPORT

(10) Install all bolts that attach support to pump housing. Then tighten bolts finger tight.

(11) Tighten support-to-pump bolts to required torque as follows:

- Reverse pump assembly and install it in transmission case. Position pump so bolts are facing out and are accessible.
 - Secure pump assembly in case with 2 or 3 bolts, or with pilot studs.
 - Tighten support-to-pump bolts to 20 N·m (15 ft. lbs.).
 - Remove pump assembly from transmission case.
- (12) Install new oil seal in pump with Special Tool C-4193 and Tool Handle C-4171 (Fig. 183). Be sure seal lip faces inward.
- (13) Install new seal ring around pump housing. Be sure seal is properly seated in groove.
- (14) Lubricate lip of pump oil seal and O-ring seal with transmission fluid.

FRONT CLUTCH**DISASSEMBLY**

(1) Remove waved snap ring and remove pressure plate, clutch plates and clutch discs (Fig. 184).

(2) Compress clutch piston spring with Compressor Tool C-3575-A (Fig. 185). Be sure legs of tool are seated squarely on spring retainer before compressing spring.

(3) Remove retainer snap ring and remove compressor tool.

(4) Remove spring retainer and clutch spring. Note position of retainer on spring for assembly reference.

(5) Remove clutch piston from clutch retainer. Remove piston by rotating it up and out of retainer.

(6) Remove seals from clutch piston and clutch retainer hub. Discard both seals as they are not reusable.

ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seals on piston and in hub of retainer. Be sure lip of each seal faces interior of clutch retainer.

(3) Lubricate lips of piston and retainer seals with liberal quantity of Mopar® Door Ease, or Ru-Glyde. Then lubricate retainer hub, bore and piston with light coat of transmission fluid.

(4) Install clutch piston in retainer (Fig. 186). Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020" thick), can be used to guide seals into place if necessary.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

DISASSEMBLY AND ASSEMBLY (Continued)

J9321-222

Fig. 184 Front Clutch Components

- | | |
|-------------------------------|----------------------------|

| 4 – SPRING RETAINER SNAP RING | 10 – PISTON SEAL |
| 5 – CLUTCH DISCS | 11 – FRONT CLUTCH RETAINER |
| 6 – PRESSURE PLATE | |

(5) Position spring in clutch piston (Fig. 187).

(6) Position spring retainer on top of piston spring (Fig. 188). **Make sure retainer is properly installed. Small raised tabs should be facing upward. Semicircular lugs on underside of retainer are for positioning retainer in spring.**

(7) Compress piston spring and retainer with Compressor Tool C-3575-A (Fig. 185). Then install new snap ring to secure spring retainer and spring.

(8) Install clutch plates and discs (Fig. 184). Install steel plate then disc until all plates and discs are installed. The front clutch uses 4 clutch discs.

(9) Install pressure plate and waved snap ring (Fig. 184).

(10) Using a suitable gauge bar and dial indicator, measure clutch plate clearance (Fig. 189).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 189).

(b) Using two small screw drivers, lift the pressure plate and compress the waved snap-ring. This

will assure that the snap-ring is at the top of the groove.

(c) Release the pressure plate and zero the dial indicator.

(d) Lift the pressure plate until it contacts the waved snap-ring and record the dial indicator reading.

Clearance should be 1.70 to 3.40 mm (0.067 to 0.134 in.). If clearance is incorrect, clutch discs, plates pressure plates and snap ring may have to be changed.

REAR CLUTCH**DISASSEMBLY**

(1) Remove thrust washer from forward side of clutch retainer.

(2) Remove input shaft front/rear seal rings.

(3) Remove selective clutch pack snap ring (Fig. 190).

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Remove top pressure plate, clutch discs, steel plates, bottom pressure plate and wave snap ring and wave spring (Fig. 190).

(5) Remove clutch piston with rotating motion.

(6) Remove and discard piston seals.

(7) Remove input shaft snap-ring (Fig. 191). It may be necessary to press the input shaft in slightly to relieve tension on the snap-ring.

(8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably

DISASSEMBLY AND ASSEMBLY (Continued)

sized press tool to support the retainer as close to the input shaft as possible.

ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft if necessary (Fig. 192).

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then press input shaft into retainer. Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft snap-ring (Fig. 191).

(5) Invert retainer and press input shaft in opposite direction until snap-ring is seated.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020" thick), can be used to guide seals into place if necessary.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

- 4 - CLUTCH PISTON

(12) Install first clutch disc in retainer on top of bottom pressure plate. Then install a clutch plate followed by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 190).

(13) Install top pressure plate.

(14) Install selective snap ring. Be sure snap ring is fully seated in retainer groove.

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 196).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 196).

(b) Using two small screw drivers, lift the pressure plate and release it.

(c) Zero the dial indicator.

(d) Lift the pressure plate until it contacts the snap-ring and record the dial indicator reading.

Clearance should be 0.64 - 1.14 mm (0.025 - 0.045 in.). If clearance is incorrect, steel plates, discs, selective snap ring and pressure plates may have to be changed.

The selective snap ring thicknesses are:

- .107-.109 in.
- .098-.100 in.
- .095-.097 in.
- .083-.085 in.
- .076-.078 in.
- .071-.073 in.
- .060-.062 in.

(16) Coat rear clutch thrust washer with petroleum jelly and install washer over input shaft and into clutch retainer (Fig. 197). Use enough petroleum jelly to hold washer in place.

PLANETARY GEARTRAIN/OUTPUT SHAFT**DISASSEMBLY**

(1) Remove planetary snap ring (Fig. 198).

(2) Remove front annulus and planetary assembly from driving shell (Fig. 198).

(3) Remove snap ring that retains front planetary gear in annulus gear (Fig. 199).

(4) Remove tabbed thrust washer and tabbed thrust plate from hub of front annulus (Fig. 200).

(5) Separate front annulus and planetary gears (Fig. 200).

DISASSEMBLY AND ASSEMBLY (Continued)

(6) Remove front planetary gear front thrust washer from annulus gear hub.

(7) Separate and remove driving shell, rear planetary and rear annulus from output shaft (Fig. 201).

(8) Remove front planetary rear thrust washer from driving shell.

(9) Remove tabbed thrust washers from rear planetary gear.

(10) Remove lock ring that retains sun gear in driving shell. Then remove sun gear, spacer and thrust plates.

J9421-175

- 3 - PLANETARY SNAP RING

J9421-176

Fig. 199 Front Planetary Snap Ring Removal

- 1 - FRONT ANNULUS GEAR
- 2 - PLANETARY SNAP RING

ASSEMBLY

(1) Lubricate output shaft and planetary components with transmission fluid. Use petroleum jelly to lubricate and hold thrust washers and plates in position.

(2) Assemble rear annulus gear and support if disassembled. Be sure support snap ring is seated and that shoulder-side of support faces rearward (Fig. 202).

J9421-177

- 2 - REAR PLANETARY
- 3 - DRIVING SHELL
- 4 - OUTPUT SHAFT

(3) Install rear thrust washer on rear planetary gear. Use enough petroleum jelly to hold washer in place. Also be sure all four washer tabs are properly engaged in gear slots.

(4) Install rear annulus over and onto rear planetary gear (Fig. 202).

(5) Install assembled rear planetary and annulus gear on output shaft (Fig. 203). Verify that assembly is fully seated on shaft.

(6) Install front thrust washer on rear planetary gear (Fig. 204). Use enough petroleum jelly to hold

DISASSEMBLY AND ASSEMBLY (Continued)

washer on gear. Be sure all four washer tabs are seated in slots.

(7) Install spacer on sun gear (Fig. 205).

(8) Install thrust plate on sun gear (Fig. 206). Note that driving shell thrust plates are interchangeable. Use either plate on sun gear and at front/rear of shell.

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 206 Installing Driving Shell Front Thrust Plate On Sun Gear

- 1 - SPACER
- 2 - SUN GEAR
- 3 - THRUST PLATE

(9) Hold sun gear in place and install thrust plate over sun gear at rear of driving shell (Fig. 207).

(10) Position wood block on bench and support sun gear on block (Fig. 208). This makes it easier to align and install sun gear lock ring. Keep wood block handy as it will also be used for geartrain end play check.

(11) Align rear thrust plate on driving shell and install sun gear lock ring. Be sure ring is fully seated in sun gear ring groove (Fig. 209).

(12) Install assembled driving shell and sun gear on output shaft (Fig. 210).

Fig. 207 Installing Driving Shell Rear Thrust Plate

- 1 - DRIVING SHELL
- 2 - SUN GEAR
- 3 - REAR THRUST PLATE

(13) Install rear thrust washer on front planetary gear (Fig. 211). Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

- 1 – FRONT PLANETARY GEAR
2 – REAR TABBED THRUST WASHER

Fig. 213 Positioning Thrust Plate On Front Annulus Support

- 1 – FRONT ANNULUS
2 – THRUST PLATE

(14) Install front planetary gear on output shaft and in driving shell (Fig. 212).

(15) Install front thrust washer on front planetary gear. Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

(16) Assemble front annulus gear and support, if necessary. Be sure support snap ring is seated.

(17) Install front annulus on front planetary (Fig. 212).

(18) Position thrust plate on front annulus gear support (Fig. 213). **Note that plate has two tabs on it. These tabs fit in notches of annulus hub.**

(19) Install thrust washer in front annulus (Fig. 214). **Align flat on washer with flat on planetary hub. Also be sure washer tab is facing up.**

(20) Install front annulus snap ring (Fig. 215). Use snap ring pliers to avoid distorting ring during installation. Also be sure ring is fully seated.

(21) Install planetary selective snap ring with snap ring pliers (Fig. 216). Be sure ring is fully seated.

(22) Turn planetary geartrain assembly over so driving shell is facing workbench. Then support geartrain on wood block positioned under forward end of output shaft. This allows geartrain components to move forward for accurate end play check.

(23) Check planetary geartrain end play with feeler gauge (Fig. 217). Gauge goes between shoulder on output shaft and end of rear annulus support.

DISASSEMBLY AND ASSEMBLY (Continued)

(24) Geartrain end play should be 0.12 to 1.22 mm (0.005 to 0.048 in.). If end play is incorrect, snap ring (or thrust washers) may have to be replaced. Snap ring is available in three different thicknesses for adjustment purposes.

CLEANING AND INSPECTION

GOVERNOR AND PARK GEAR

Thoroughly clean all the governor parts in a suitable cleaning solution but do not use any type of caustic cleaning agents.

The governor weight components (Fig. 218) and the governor valve (Fig. 219), must slide freely in their bores when clean and dry. Minor surface scratches and burrs can be smoothed with crocus cloth.

The aluminum governor valve and outer weight have a hard coating on them. Check condition of this coating carefully. Do not reuse either part if the coating is damaged.

Inspect the governor weight spring for distortion. Replace the spring, if distorted, collapsed, or broken. Clean the filter in solvent and dry it with compressed air. Replace the filter, if damaged. Inspect the park gear for chipped or worn gear teeth or damaged ring grooves. Replace the gear, if damaged.

Check the teeth on the park gear for wear or damage. Replace the gear if necessary. Inspect the metal seal rings on the park gear hub. Replace the rings only if severely worn, or broken.

EXTENSION HOUSING AND PARK LOCK

Clean the housing and park lock components in solvent and dry them with compressed air.

Examine the park lock components in the housing. If replacement is necessary, remove the shaft with parallel jaw snap ring pliers (Fig. 220) and remove the sprag and spring. Then remove the spring clip and reaction plug (Fig. 221). **Compress the reaction plug spring clip only enough to remove and install it. Do not distort the clip during removal or installation.**

Be sure a replacement sprag is installed so the sprag locking lug will face the park gear (Fig. 222). Also be sure the spring is correctly positioned as shown (Fig. 222). The sprag may not retract if the spring is improperly installed.

VALVE BODY

Serviceable valve body components are:

- park lock rod and E-clip
- switch valve and spring
- pressure adjusting screw bracket
- throttle valve lever
- manual lever
- manual lever shaft seal, washer, E-clip and detent ball
- fluid filter
- converter clutch solenoid

The remaining valve body components are serviced only as part of a complete valve body assembly.

Fig. 218 Governor Weights

- 1 - INTERMEDIATE WEIGHT
2 - SNAP RING
3 - INNER WEIGHT

- 4 - INNER WEIGHT SPRING
5 - OUTER WEIGHT

CLEANING AND INSPECTION (Continued)

**Fig. 219 Governor Components**

- 1 - SEAL RING (PLAIN END)
- 2 - SEAL RING (HOOK END)
- 3 - PARK GEAR
- 4 - GOVERNOR BODY
- 5 - GOVERNOR VALVE
- 6 - VALVE SHAFT
- 7 - E-CLIPS (2)
- 8 - FILTER

- 9 - SNAP RING (THIN)
- 10 - SNAP RING (THICK)
- 11 - SNAP RING
- 12 - RETAINER WASHER
- 13 - GOVERNOR WEIGHT ASSEMBLY
- 14 - GOVERNOR BODY BOLTS (4)
- 15 - WASHER

Clean the valve body components in a parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution. Dry the parts with compressed air. Make sure all passages are clean and free from obstructions.

NOTE: Do not use rags or shop towels to wipe off valve body components. Lint from these materials will adhere to the valve body components. Lint will interfere with valve operation and may clog filters and fluid passages.

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straight-edge to check surface flatness. Minor scratches may

be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with crocus cloth. The cloth should be in sheet form and be positioned on a surface plate, sheet of plate glass, or equally flat surface. However, if distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

CAUTION: Many of the valve body valves and plugs are made of coated aluminum. Aluminum components can be identified by the dark color of the special coating applied to the surface (or by testing with a magnet). **DO NOT** polish or sand aluminum valves or plugs with any type of material, or under any circumstances. This practice might damage the special coating and cause the valves and plugs to stick and bind.

CLEANING AND INSPECTION (Continued)

**Fig. 220 Park Sprag, Shaft And Spring**

- 1 - SPRAG SHAFT
- 2 - PARALLEL JAW SNAP RING PLIERS
- 3 - SPRAG
- 4 - SPRING

**Fig. 222 Correct Position Of Sprag And Spring**

- 1 - SPRAG SHAFT
- 2 - SPRAG LOCKING LUG
- 3 - SPRING

**Fig. 221 Park Sprag Reaction Plug And Spring Location**

- 1 - SPRING CLIP
- 2 - REACTION PLUG

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Also inspect the coating on the aluminum valves and plugs (Fig. 223). If the coating is damaged or worn through, the valve (or valve body) should be replaced.

Aluminum valves and plugs should not be sanded or polished under any circumstances. However, minor burrs or scratches on steel valves and plugs can be removed with crocus cloth but do not round off the valve or plug edges. Squareness of these edges is vitally important. These edges prevent foreign matter from lodging between the valves, plugs and bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores. Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

CLEANING AND INSPECTION (Continued)

80a13872

TRANSMISSION

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will readily adhere to case surfaces and transmission components and will circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

Inspect the case for cracks, porous spots, worn servo bores, or damaged threads. However, the case will have to be replaced if it exhibits damage or wear.

Lubricate the front band adjusting screw and locknut with petroleum jelly and thread it part way into the case. Be sure the screw turns freely and does not bind. Install the locknut on the screw after checking screw thread operation.

Inspect all the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. Replace worn, or scored bushings, or if doubt exists about bushing condition.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install and seat bushings correctly. The bushing replacement

CLEANING AND INSPECTION (Continued)

tools are included in Bushing Tool Sets C-3887-B, or C-3887-J.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced. Replace the gear as an assembly if the bushings are severely scored, or worn.

Heli-Coil inserts are recommended for repairing damaged, stripped or worn threads in aluminum parts. Stainless steel inserts are preferred.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF Plus 3, Type 7176 transmission fluid during assembly. Use Mopar® Door Ease, or Ru-Glyde to lubricate piston seals and O-rings. Use petroleum jelly on thrust washers and to hold parts in place during reassembly.

OVERRUNNING CLUTCH/LOW-REVERSE DRUM/OVERDRIVE PISTON RETAINER

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

FRONT SERVO

Clean the servo piston components with solvent and dry them with compressed air. Wipe the band clean with lint free shop towels.

Replace the front band if distorted, lining is burned, flaking off, or worn to the point where the grooves in the lining material are no longer visible.

Inspect the servo components (Fig. 224). Replace the springs if collapsed, distorted or broken. Replace the guide, rod and piston if cracked, bent, or worn. Discard the servo snap ring if distorted or warped.

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

Fig. 224

- 1 - PISTON RINGS
- 2 - O-RING
- 3 - SNAP-RING
- 4 - SEAL RING
- 5 - PISTON ROD GUIDE
- 6 - SNAP-RING
- 7 - SERVO SPRING
- 8 - PISTON ROD
- 9 - SERVO PISTON

REAR SERVO

Remove and discard the servo piston seal ring (Fig. 225). Then clean the servo components with solvent and dry with compressed air. Replace either spring if collapsed, distorted or broken. Replace the plug and piston if cracked, bent, or worn. Discard the servo snap rings and use a new ones at assembly.

OIL PUMP AND REACTION SHAFT SUPPORT

(1) Clean pump and support components with solvent and dry them with compressed air.

(2) Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

(3) Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

CLEANING AND INSPECTION (Continued)

J9121-64

Fig. 225 Rear Servo Components

- 1 - SNAP RING
- 2 - PISTON SEAL
- 3 - PISTON PLUG
- 4 - SPRING RETAINER
- 5 - SNAP RING
- 6 - PISTON SPRING
- 7 - CUSHION SPRING
- 8 - PISTON

(4) Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

(5) Install the gears in the pump body and measure pump component clearances as follows:

(a) Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by:

(I) Installing the pump gears in the pump housing.

(II) Position an appropriate piece of Plastigage[™] across both gears.

(III) Align the plastigage to a flat area on the reaction shaft housing.

(IV) Install the reaction shaft to the pump housing.

(V) Separate the reaction shaft housing from the pump housing and measure the Plastigage[™] following the instructions supplied with it.

(b) Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

(c) Clearance between outer gear and pump housing should also be 0.010 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

FRONT CLUTCH

Clean and inspect the front clutch components. Replace the clutch discs if warped, worn, scored,

burned or charred, or if the facing is flaking off. Replace the steel plates if heavily scored, warped, or broken. Be sure the driving lugs on the plates are in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the clutch spring and spring retainer if either is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The steel plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged.

Check action of the check ball in the retainer (Fig. 226). The ball must move freely and not stick.

NOTE: Inspect the clutch retainer bushings carefully (Fig. 227). The retainer bushings are **NOT** serviceable. It will be necessary to replace the retainer if either bushing is scored, or worn.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

J9121-368

Fig. 226 Front Clutch Piston Retainer Check Ball Location

- 1 - RETAINER CHECK BALL

REAR CLUTCH

Clean the clutch components with solvent and dry them with compressed air.

Check condition of the input shaft seal rings. It is not necessary to remove or replace rings unless they are broken, cracked, or no longer securely hooked together.

Inspect the input shaft splines and machined surfaces. Very minor nicks or scratches can be smoothed off with crocus cloth. Replace the shaft if the splines are damaged, or any of the machined surfaces are severely scored.

CLEANING AND INSPECTION (Continued)

**Fig. 227 Retainer Bushing Location/Inspection**

1 – FRONT CLUTCH RETAINER BUSHINGS (NON-SERVICEABLE)

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off.

Replace the steel plates and the pressure plate if heavily scored, warped, or broken. Be sure the driving lugs on the discs and plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The steel plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the retainer check ball. The ball must move freely and not stick.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously damaged.

Check thrust washer condition. Washer thickness should be 1.55 to 1.60 mm (0.061 to 0.063 in.). Replace the washer if worn or damaged.

Check condition of the two seal rings on the input shaft and the single seal ring on the piston retainer hub. Replace the seal rings only if severely worn, cracked, or cannot be hooked together.

PLANETARY GEARTRAIN/OUTPUT SHAFT

Clean the intermediate shaft and planetary components in solvent and dry them with compressed air. Do not spin the planetary pinion gears with compressed air.

Inspect the planetary gear sets and annulus gears. The planetary pinions, shafts, washers, and retaining pins are serviceable. However, if a pinion carrier is damaged, the entire planetary gear set must be replaced as an assembly.

Replace the annulus gears if the teeth are chipped, broken, or worn, or the gear is cracked. Replace the planetary thrust plates and the tabbed thrust washers if cracked, scored or worn.

Inspect the machined surfaces of the output shaft. Be sure the oil passages are open and clear. Replace the shaft if scored, pitted, or damaged.

Inspect the sun gear and driving shell. If either component is worn or damaged, remove the sun gear rear retaining ring and separate the sun gear and thrust plate from the driving shell. Then replace the necessary component.

Replace the sun gear as an assembly if the gear teeth are chipped or worn. Also replace the gear as an assembly if the bushings are scored or worn. The sun gear bushings are not serviceable. Replace the thrust plate if worn, or severely scored. Replace the driving shell if distorted, cracked, or damaged in any way.

Replace all snap rings during geartrain assembly. Reusing snap rings is not recommended.

ADJUSTMENTS**GEARSHIFT CABLE**

Check adjustment by starting the engine in Park and Neutral. Adjustment is OK if the engine starts only in these positions. Adjustment is incorrect if the engine starts in one but not both positions. If the engine starts in any position other than Park or Neutral, or if the engine will not start at all, the park/neutral position switch may be faulty.

Gearshift Adjustment Procedure

- (1) Shift transmission into Park.
- (2) Raise vehicle.
- (3) Release cable adjuster clamp (at transmission end of cable) to unlock cable.
- (4) Unsnap cable from cable mounting bracket on transmission (Fig. 228).
- (5) Slide cable eyelet off transmission shift lever.
- (6) Verify transmission shift lever is in Park detent by moving lever fully rearward. Last rearward detent is Park position.
- (7) Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
- (8) Slide cable eyelet onto transmission shift lever.
- (9) Snap shift cable adjuster into mounting bracket on transmission.
- (10) Lock shift cable by pressing cable adjuster clamp down until it snaps into place.
- (11) Lower vehicle and check engine starting. Engine should start only in Park and Neutral.

ADJUSTMENTS (Continued)

J9321-417

Fig. 228 Shift Cable Attachment At Transmission—Typical

- 1 - THROTTLE VALVE CABLE
- 2 - TRANSMISSION SHIFT LEVER
- 3 - SHIFT CABLE
- 4 - SHIFT CABLE BRACKET

BRAKE TRANSMISSION SHIFT INTERLOCK CABLE ADJUSTMENT

- (1) Shift transmission into PARK.
- (2) Remove shift lever bezel and console screws. Raise bezel and console for access to cable.
- (3) Pull cable lock button up to release cable (Fig. 229).
- (4) Turn ignition switch to LOCK position.
- (5) Use a spacer to create a one millimeter gap between the shifter pawl and top of the shift gate.
- (6) Pull cable forward. Then release cable and press cable lock button down until it snaps in place.
- (7) Check adjustment as follows:
 - (a) Check movement of release shift handle button (floor shift) or release lever (column shift). You should not be able to press button inward or move column lever.
 - (b) Turn ignition switch to RUN position.
 - (c) Shifting out of park should not be possible.
 - (d) Apply the brake and attempt to shift out of PARK. Shifting should be possible.
 - (e) While the transmission is shifted out of PARK, release the brake and attempt to shift through all gears. Release the shift button at least once during this procedure. The ignition key should not go to the LOCK position.

J9321-250

Fig. 229 Park Lock Cable Attachment

- 1 - PARK LOCK CABLE
- 2 - CABLE LOCK BUTTON
- 3 - SHIFT LEVER ASSEMBLY
- 4 - SHIFT CABLE

(f) Return transmission to the PARK position without applying the brake.

(8) Move shift lever back to PARK and check ignition switch operation. You should be able to turn switch to LOCK position and shift lever release button/lever should not move.

TRANSMISSION THROTTLE VALVE CABLE ADJUSTMENT

The transmission throttle valve is operated by a cam on the throttle lever. The throttle lever is operated by an adjustable cable (Fig. 230). The cable is attached to an arm mounted on the throttle lever shaft. A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

A correctly adjusted throttle valve cable will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment will allow simultaneous movement without causing the transmission throttle lever to either move ahead of, or lag behind the lever on the throttle body.

Checking Throttle Valve Cable Adjustment

- (1) Turn ignition key to OFF position.
- (2) Remove air cleaner.
- (3) Verify that lever on throttle body is at curb idle position. Then verify that transmission throttle lever (Fig. 231) is also at idle (fully forward) position.
- (4) Slide cable off attachment stud on throttle body lever.
- (5) Compare position of cable end to attachment stud on throttle body lever:

ADJUSTMENTS (Continued)

**Fig. 230 Throttle Cable Attachment At Engine**

- 1 - TRANSMISSION THROTTLE VALVE CABLE
- 2 - ACCELERATOR CABLE
- 3 - CABLE ENGINE BRACKET
- 4 - THROTTLE BODY
- 5 - CABLE GUIDE

**Fig. 231 Throttle Cable Attachment At Transmission**

- 1 - RETURN SPRING
- 2 - THROTTLE VALVE CABLE
- 3 - THROTTLE VALVE CABLE BRACKET
- 4 - THROTTLE VALVE LEVER
- 5 - GEAR SELECTOR LEVER
- 6 - SHIFT CABLE BRACKET

• Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction.

• If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in Throttle Valve Cable Adjustment procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

• If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.

• If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

Throttle Valve Cable Adjustment Procedure

- (1) Turn ignition switch to OFF position.
- (2) Remove air cleaner if necessary.
- (3) Disconnect cable end from attachment stud. **Carefully slide cable off stud. Do not pry or pull cable off.**
- (4) Verify that transmission throttle lever is in fully closed position. Then be sure lever on throttle body is at curb idle position.
- (5) Insert a small screwdriver under edge of retaining clip and remove retaining clip.
- (6) Center cable end on attachment stud to within 1 mm (0.039 in.).

NOTE: Be sure that as the cable is pulled forward and centered on the throttle lever stud, the cable housing moves smoothly with the cable. Due to the angle at which the cable housing enters the spring housing, the cable housing may bind slightly and create an incorrect adjustment.

- (7) Install retaining clip onto cable housing.
- (8) Check cable adjustment. Verify transmission throttle lever and lever on throttle body move simultaneously.

FRONT BAND ADJUSTMENT

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

- (1) Raise vehicle.
- (2) Loosen band adjusting screw locknut (Fig. 232). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.
- (3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and appropriate Torx socket.

CAUTION: If Adapter C-3705 is needed to reach the adjusting screw, tighten the screw to only 5 N·m (47-50 in. lbs.) torque.

- (4) Back off front band adjusting screw 2-1/2 turns.
- (5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.
- (6) Lower vehicle.

ADJUSTMENTS (Continued)

**Fig. 232 Front Band Adjustment Screw Location**

- 1 - LOCK-NUT
2 - FRONT BAND ADJUSTER

REAR BAND ADJUSTMENT

The transmission oil pan must be removed for access to the rear band adjusting screw.

- (1) Raise vehicle.
- (2) Remove transmission oil pan and drain fluid.
- (3) Loosen band adjusting screw locknut 5-6 turns. Be sure adjusting screw turns freely in lever.
- (4) Tighten adjusting screw to 5 N·m (41 in. lbs.) (Fig. 233).
- (5) Back off adjusting screw 7 turns.
- (6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.
- (7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.
- (8) Lower vehicle and refill transmission with Mopar® ATF Plus 3, Type 7176, fluid.

VALVE BODY**CONTROL PRESSURE ADJUSTMENTS**

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 234).

Distance should be 33.4 mm (1-5/16 in.).

**Fig. 233 Rear Band Adjustment Screw Location**

- 1 - 30RH REAR BAND LEVER AND ADJUSTING SCREW
2 - 32RH REAR BAND LEVER AND ADJUSTING SCREW

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 235).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

ADJUSTMENTS (Continued)

**Fig. 234 Line Pressure Adjustment**

- 1 - WRENCH
- 2 - 1-5/16 INCH

NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.

DESCRIPTION AND OPERATION

AW-4 AUTOMATIC TRANSMISSION

DESCRIPTION

The AW-4 is a 4-speed, electronically controlled automatic transmission (Fig. 1).

The running gear consists of an oil pump, planetary gear sets, clutch and brake units, hydraulic accumulators, a valve body with electrical solenoids, and a transmission control module (TCM). Cables are used to provide shift and throttle pressure control information. A park/neutral position switch permits engine starting in the Park and Neutral ranges only.

TRANSMISSION IDENTIFICATION

The transmission I. D. plate is attached to the case (Fig. 2). The plate contains the transmission serial and model numbers. Refer to the information on this plate when ordering service parts.

ELECTRONIC CONTROLS

The AW-4 is electronically controlled in 1, 2, 3 and D ranges. Controls consist of the transmission control module (TCM), valve body solenoids and various sensors. The sensors monitor vehicle speed, throttle opening, shift lever position and brake pedal application.

TRANSMISSION GEAR RATIOS

Fourth gear is an 0.75:1 ratio overdrive range. First, second, third and reverse gear are conventional ranges. Third gear ratio is 1:1. A separate planetary gear set provides overdrive operation in fourth gear.

J8921-400

Fig. 2 Transmission Identification

1 – TRANSMISSION I. D. PLATE

OPERATION

GEARTRAIN OPERATION AND APPLICATION CHARTS

Operation and application of the first through fourth and reverse gear elements are outlined in the function and application charts.

The Component Function Chart describes basic function of various geartrain elements. The Component Application Chart indicates which elements (including valve body solenoids), are applied in the various gear ranges.

J8921-398

Fig. 1 AW-4 Automatic Transmission

DESCRIPTION AND OPERATION (Continued)

COMPONENT FUNCTION CHART

COMPONENT NAME	COMPONENT FUNCTION
Overdrive Direct Clutch	Connects overdrive sun gear and overdrive carrier.
Overdrive Brake	Prevents overdrive sun gear from turning either clockwise or counter-clockwise.
Overdrive One-Way Clutch	When transmission is driven by engine, connects overdrive sun gear and overdrive carrier.
Forward Clutch	Connects input shaft and front ring gear.
Direct Clutch	Connects input shaft to the front and rear ring gears.
Second Coast Brake	Prevents front and rear sun gear from turning either clockwise or counter-clockwise.
Second Brake	Prevents outer race of number 1 one-way clutch from turning either clockwise or counter-clockwise, thus preventing the front and rear sun gears from turning counter-clockwise.
First/Reverse Brake	Prevents the rear planetary carrier from turning either clockwise or counter-clockwise.
Number 1 One-way Clutch	When second brake is operating, prevents the front and rear sun gears from turning counter-clockwise.
Number 2 One-Way Clutch	Prevents the rear planetary carrier from turning counter-clockwise.

COMPONENT APPLICATION CHART

J8921-405

DESCRIPTION AND OPERATION (Continued)

FIRST/SECOND/THIRD/REVERSE GEAR COMPONENTS

First through third and reverse gear components are outlined in (Fig. 3).

The input shaft is meshed with the direct clutch hub and the forward clutch drum. These elements rotate as a unit. The forward clutch hub rotates as a unit with the front planetary ring gear. The direct clutch drum is meshed with the forward end of the planetary sun gear.

The second brake hub serves as the outer race of one-way clutch No. 1. The clutch inner race is locked with the front/rear sun gear. The inner race of one-way clutch No. 2 is splined to the transmission case and is locked. The outer race rotates as a unit with the rear planetary carrier.

The rear planetary ring gear is splined to the output shaft. The front planetary carrier and rear carrier ring gear are meshed and rotate as a unit with the output shaft.

FOURTH GEAR OVERDRIVE COMPONENTS

The overdrive system consists of the input shaft, one-way clutch, planetary sun gear, ring gear, planetary carrier, overdrive clutch and overdrive brake (Fig. 4). The overdrive elements are controlled and

applied through transmission valve body solenoid number two.

In fourth gear, the overdrive brake prevents the overdrive sun gear from turning. The overdrive input shaft and planetary carrier rotate as a unit. The sun gear and overdrive direct clutch drum are in mesh and operate as a single unit. The direct clutch splines function as the hub for the overdrive brake. The one-way clutch outer race is in mesh with the planetary carrier. The inner race is fixed to the sun gear shaft.

FLUID

NOTE: Refer to the maintenance schedules in Group 0, Lubrication and Maintenance for the recommended maintenance (fluid/filter change) intervals for this transmission.

NOTE: Refer to Service Procedures in this group for fluid level checking procedures.

DESCRIPTION

Mopar® Dexron IIE/Mercon is the recommended fluid for the AW-4 automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® Dexron IIE/Mercon automatic transmission fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** A dark brown/black fluid accompanied with a burnt odor and/or deterioration in shift quality may indicate fluid deterioration or transmission component failure.

FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter

clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used**. The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

OPERATION

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

DESCRIPTION AND OPERATION (Continued)

TORQUE CONVERTER

DESCRIPTION

The torque converter (Fig. 5) is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. Torque converter clutch engagement occurs in second gear in 1-2 position; third gear in 3 position and third and fourth gear in D position. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid. If the fluid is contaminated, flush the fluid cooler and lines.

- 6 - DRIVE PLATE

DESCRIPTION AND OPERATION (Continued)

IMPELLER

The impeller (Fig. 6) is an integral part of the converter housing. The impeller consists of curved vanes placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one in the same and are the driving member of the system.

DESCRIPTION AND OPERATION (Continued)

TURBINE

The turbine (Fig. 7) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not mounted to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

DESCRIPTION AND OPERATION (Continued)

STATOR

The stator assembly (Fig. 8) is mounted on a stationary shaft which is an integral part of the oil pump. The stator also contains an over-running clutch. The stator is located between the impeller and turbine within the torque converter case (Fig. 9). The over-running clutch of the stator allows the stator to rotate only in a clockwise direction.

Fig. 8 Stator Components

- 1 - CAM (OUTER RACE)

- 3 - SPRING
- 4 - INNER RACE

TORQUE CONVERTER CLUTCH (TCC)

The TCC (Fig. 10) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston was added to the turbine, and a friction material was added to the inside of the impeller housing to provide this mechanical lock-up.

OPERATION

The converter impeller (Fig. 11) (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them

(turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's vanes it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Torque multiplication is achieved by locking the clutch to its shaft (Fig. 12). Under stall conditions (the turbine is stationary), the oil leaving the turbine vanes strikes the face of the stator vanes and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator vanes and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.2:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

DESCRIPTION AND OPERATION (Continued)

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston to the impeller's friction material, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The engagement and disengagement of the TCC are automatic and controlled by the Transmission Control Module (TCM). Inputs that determine clutch engagement are: coolant temperature, vehicle speed and throttle position. Clutch engagement is controlled by transmission valve body solenoid number three and by the converter clutch relay valve. The solenoid channels line pressure to the clutch through the relay valve at clutch engagement speeds.

OIL PUMP

DESCRIPTION

The oil pump (Fig. 13) is located in the pump housing inside the bell housing of the transmission case. The oil pump consists of an inner and outer gear, a housing, and a cover that also serves as the reaction shaft support.

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

DESCRIPTION AND OPERATION (Continued)

TRANSMISSION VALVE BODY COMPONENTS

DESCRIPTION

Transmission operating pressure is supplied to the clutch and brake apply circuits through the transmission valve body. The valve body consists of an upper body, lower body, separator plate and upper and lower gaskets (Fig. 14). The various spool valves, sleeves, plugs and springs are located within the two body sections.

The manual valve, 1-2 shift valve, primary regulator valve, accumulator control valve, check balls, and oil strainers are located in the lower body section (Fig. 15). The remaining control and shift valves plus check balls and one additional oil strainer are located in the upper body section (Fig. 16).

TRANSMISSION VALVE BODY SOLENOIDS

The solenoids are mounted on the valve body and operated by the TCM. The solenoids control operation of the converter clutch and shift valves in response to input signals from the module.

OPERATION**MANUAL VALVE**

The manual valve is operated by the gearshift linkage. The valve diverts fluid to the apply circuits according to shift lever position (Fig. 17).

**Fig. 17 Manual Valve**

DESCRIPTION AND OPERATION (Continued)

PRIMARY REGULATOR VALVE

The primary regulator valve (Fig. 18) modulates line pressure to the clutches and brakes according to engine load. The valve is actuated by throttle valve pressure.

Fig. 18 Primary Regulator Valve

- 1 - THROTTLE PRESSURE
- 2 - LINE PRESSURE (FROM MANUAL VALVE "R" RANGE)

- 4 - CONVERTER PRESSURE TO CONVERTER CLUTCH RELAY VALVE
- 5 - LINE PRESSURE
- 6 - CONVERTER PRESSURE (TO SECONDARY REGULATOR VALVE)
- 7 - DRAIN
- 8 - DRAIN

During high load operation, the valve increases line pressure to maintain positive clutch and brake engagement. At light load, the valve decreases line pressure just enough to maintain smooth engagement.

THROTTLE VALVE AND DOWNSHIFT PLUG

The throttle valve and downshift plug (Fig. 19) control throttle pressure to the primary regulator valve.

The downshift plug and throttle valve are operated by the throttle valve cam and throttle cable in response to engine throttle position. Throttle valve

Fig. 19 Throttle Valve And Downshift Plug

- 7 - CUT-BACK PRESSURE (FROM CUT-BACK VALVE)

pressure is also modulated by the cut-back valve in second, third and fourth gear ranges.

CUT-BACK VALVE

The cut-back valve (Fig. 20) helps prevent excessive pump pressure buildup in second, third and fourth gear. The valve is actuated by throttle pressure and by line pressure from the second brake. The valve also helps regulate line pressure by controlling the amount of cut-back pressure to the throttle valve.

SECONDARY REGULATOR VALVE

The secondary regulator valve (Fig. 21) regulates converter clutch and transmission lubrication pressure. When primary regulator valve pressure exceeds requirements for clutch engagement or transmission lubrication, the secondary regulator valve is moved upward exposing the drain port. Excess pressure then bleeds off as needed. As pressure drops, spring

tension moves the valve downward closing the drain port.

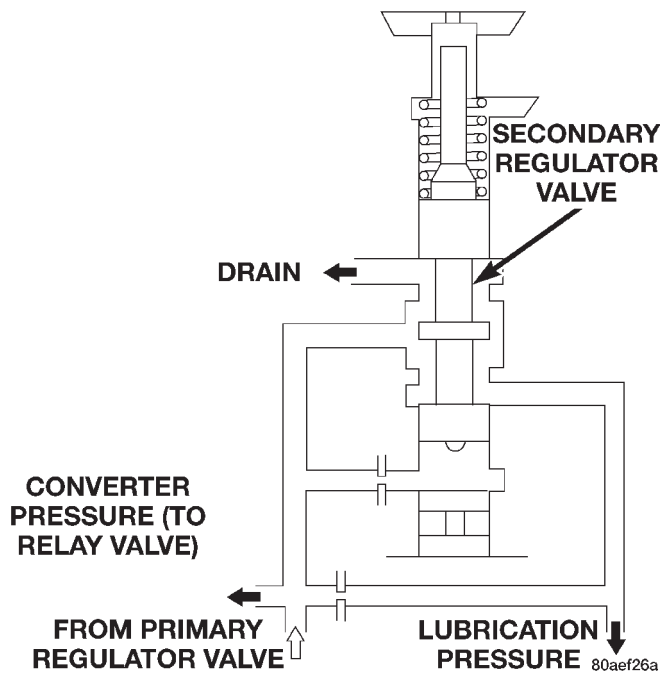

Fig. 21 Secondary Regulator Valve

CONVERTER CLUTCH RELAY VALVE

The converter clutch relay valve (Fig. 22) controls fluid flow to the converter clutch. The valve is oper-

ated by line pressure from the 1-2 shift valve and is controlled by solenoid valve number three.

Fig. 22 Converter Clutch Relay Valve

1-2 SHIFT VALVE

The 1-2 shift valve (Fig. 23) controls the 1-2 upshifts and downshifts. The valve is operated by the No. 2 valve body solenoid and line pressure from the manual valve, second coast modulator valve and the 2-3 shift valve.

When the transmission control module deactivates the solenoid, line pressure at the top of the valve moves the valve down closing the second brake accumulator feed port. As the solenoid is activated and the drain port opens, spring force moves the valve up exposing the second brake feed port for the shift to second gear.

2-3 SHIFT VALVE

The 2-3 shift valve (Fig. 24) controls the 2-3 upshifts and downshifts. The valve is actuated by the No. 1 valve body solenoid and by line pressure from the manual valve and primary regulator valve.

DESCRIPTION AND OPERATION (Continued)

Fig. 23 1-2 Shift Valve

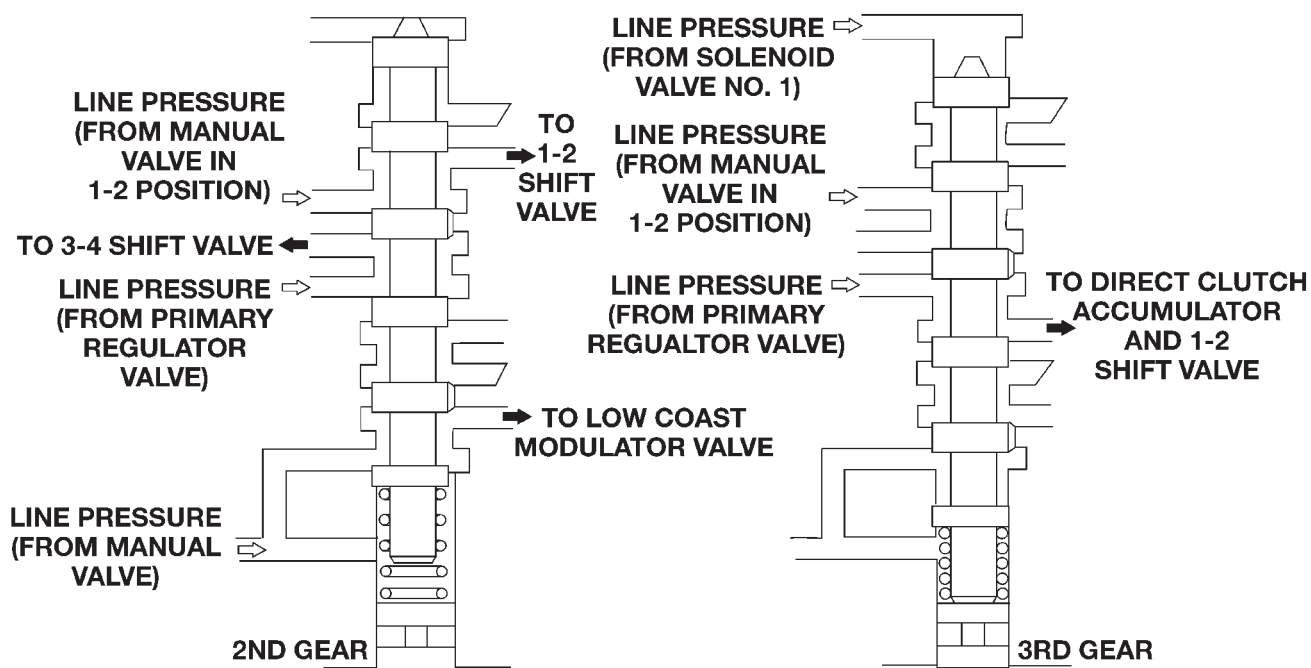

Fig. 24 2-3 Shift Valve

When the TCM activates solenoid No. 1, line pressure at the top of the 2-3 valve is released through the solenoid drain port. Spring tension moves the valve up to hold the valve in second gear position. As the solenoid is deactivated, line pressure then moves the valve down exposing the direct clutch feed port for the shift to third gear.

DESCRIPTION AND OPERATION (Continued)

3-4 SHIFT VALVE

The 3-4 shift valve (Fig. 25) is operated by the No. 2 solenoid and by line pressure from the manual valve, 2-3 valve and primary regulator valve.

Energizing the No. 2 solenoid causes line pressure at the top of the 3-4 valve to be released through the solenoid valve drain port. Spring tension moves the valve up exposing the overdrive clutch accumulator feed port to apply the clutch.

De-energizing the solenoid causes the drain port to close. Line pressure then moves the valve down exposing the overdrive brake accumulator feed port for the shift to fourth gear.

In the 1-2 or 3 gearshift lever positions, line pressure from the 2-3 shift valve is applied to the lower end of the 3-4 valve. This holds the valve upward, closing off the overdrive brake feed port preventing a shift into fourth gear.

SECOND COAST MODULATOR VALVE

The second coast modulator valve (Fig. 26) momentarily reduces line pressure from the 1-2 shift valve. This cushions application of the second coast brake. The valve is operative when the shift lever and manual valve are in the 3 position.

LOW COAST MODULATOR VALVE

The low coast modulator valve (Fig. 27) momentarily reduces line pressure from the 2-3 shift valve;

80aef26f

80aef271

Fig. 28 Accumulator Control Valve

- 1 - ACCUMULATOR CONTROL PRESSURE (TO ACCUMULATORS)
- 2 - THROTTLE PRESSURE
- 3 - LINE PRESSURE (FROM PUMP)

ACCUMULATOR CONTROL VALVE

The accumulator control valve (Fig. 28) cushions the transmission clutch and brake applications. This is achieved by reducing back pressure to the accumulators when throttle opening is small. The valve is operated by line and throttle pressure.

ACCUMULATORS

Four accumulators are used to cushion clutch and brake application. The accumulators (Fig. 29), consist of spring loaded pistons. The pistons dampen the initial surge of apply pressure to provide smooth engagement during shifts.

Control pressure from the accumulator control valve is continuously applied to the back pressure side of the accumulator pistons. This pressure plus spring tension holds the pistons down. As line pressure from the shift valves enters the opposite end of the piston bore, control pressure and spring tension momentarily delay application of full line pressure to cushion engagement. The accumulators are all located in the transmission case (Fig. 29).

TRANSMISSION VALVE BODY SOLENOIDS

Three solenoids are used (Fig. 30). The No. 1 and 2 solenoids control shift valve operation by applying or releasing line pressure. The signal to apply or release

pressure is provided by the transmission control module.

The No. 3 solenoid controls operation of the torque converter clutch. The solenoid operates in response to signals from the transmission control module.

When the No. 1 and 2 solenoids are activated, the solenoid plunger is moved off its seat opening the drain port to release line pressure. When either solenoid is deactivated, the plunger closes the drain port.

The No. 3 solenoid operates in reverse. When the solenoid is deactivated, the solenoid plunger is moved off its seat opening the drain port to release line pressure. When the solenoid is activated, the plunger closes the drain port.

PISTONS

DESCRIPTION

There are several sizes and types of pistons used in an automatic transmission. Some pistons are used to apply clutches, while others are used to apply bands. They all have in common the fact that they are round or circular in shape, located within a smooth walled cylinder, which is closed at one end and converts fluid pressure into mechanical movement. The fluid pressure exerted on the piston is contained within the system through the use of piston rings or seals.

DESCRIPTION AND OPERATION (Continued)

**Fig. 29 Accumulators**

- 1 - OVERDRIVE CLUTCH
- 2 - SECOND BRAKE
- 3 - DIRECT CLUTCH
- 4 - OVERDRIVE BRAKE

**Fig. 30 Transmission Valve Body Solenoids****OPERATION**

The principal which makes this operation possible is known as Pascal's Law. Pascal's Law can be stated as: "Pressure on a confined fluid is transmitted equally in all directions and acts with equal force on equal areas."

PRESSURE

Pressure (Fig. 31) is nothing more than force (lbs.) divided by area (in or ft.), or force per unit area. Given a 100 lb. block and an area of 100 sq. in. on the floor, the pressure exerted by the block is: 100 lbs. 100 in or 1 pound per square inch, or PSI as it is commonly referred to.

80bfe272

Fig. 31 Force and Pressure Relationship**PRESSURE ON A CONFINED FLUID**

Pressure is exerted on a confined fluid (Fig. 32) by applying a force to some given area in contact with the fluid. A good example of this is a cylinder filled with fluid and equipped with a piston that is closely fitted to the cylinder wall. If a force is applied to the piston, pressure will be developed in the fluid. Of course, no pressure will be created if the fluid is not confined. It will simply "leak" past the piston. There must be a resistance to flow in order to create pressure. Piston sealing is extremely important in hydraulic operation. Several kinds of seals are used to accomplish this within a transmission. These include but are not limited to O-rings, D-rings, lip seals, sealing rings, or extremely close tolerances between the piston and the cylinder wall. The force exerted is downward (gravity), however, the principle remains the same no matter which direction is taken.

DESCRIPTION AND OPERATION (Continued)

The pressure created in the fluid is equal to the force applied, divided by the piston area. If the force is 100 lbs., and the piston area is 10 sq. in., then the pressure created equals 10 PSI. Another interpretation of Pascal's Law is that regardless of container shape or size, the pressure will be maintained throughout, as long as the fluid is confined. In other words, the pressure in the fluid is the same everywhere within the container.

Fig. 32 Pressure on a Confined Fluid

FORCE MULTIPLICATION

Using the 10 PSI example used in the illustration (Fig. 33), a force of 1000 lbs. can be moved with a force of only 100 lbs. The secret of force multiplication in hydraulic systems is the total fluid contact area employed. The illustration, (Fig. 33), shows an area that is ten times larger than the original area. The pressure created with the smaller 100 lb. input is 10 PSI. The concept "pressure is the same everywhere" means that the pressure underneath the larger piston is also 10 PSI. Pressure is equal to the force applied divided by the contact area. Therefore, by means of simple algebra, the output force may be found. This concept is extremely important, as it is also used in the design and operation of all shift valves and limiting valves in the valve body, as well as the pistons, of the transmission, which activate the clutches and bands. It is nothing more than using a difference of area to create a difference in pressure to move an object.

PISTON TRAVEL

The relationship between hydraulic lever and a mechanical lever is the same. With a mechanical lever it's a weight-to-distance output rather than a pressure-to-area output. Using the same forces and areas as in the previous example, the smaller piston (Fig. 34) has to move ten times the distance required to move the larger piston one inch. Therefore, for every inch the larger piston moves, the smaller pis-

80bfe274

Fig. 33 Force Multiplication

ton moves ten inches. This principle is true in other instances also. A common garage floor jack is a good example. To raise a car weighing 2000 lbs., an effort of only 100 lbs. may be required. For every inch the car moves upward, the input piston at the jack handle must move 20 inches downward.

80bfe275

Fig. 34 Piston Travel

TRANSMISSION RANGES AND SHIFT LEVER POSITIONS

The AW-4 transmission has six ranges and shift lever positions. Park, Reverse and Neutral are conventional and mechanically operated. The 1-2, 3 and D ranges provide electronically controlled shifting.

The 1-2 position provides first and second gear only. The 3 position provides first, second and third gear.

DESCRIPTION AND OPERATION (Continued)

The D range provides first through fourth gear. Overdrive fourth gear range is available only when the shift lever is in D position (Fig. 35).

J8921-399

Fig. 35 AW-4 Shift Lever Positions And Transmission Ranges

TRANSMISSION CONTROL MODULE (TCM)

DESCRIPTION

The module determines shift and converter clutch engagement timing based on signals from sensors. The valve body solenoids are activated, or deactivated accordingly.

The TCM has a self diagnostic program. Component and circuitry malfunctions can be diagnosed with the DRB scan tool. Once a malfunction is noted and stored in control module memory, it is retained even after the problem has been corrected. To cancel a stored malfunction, disconnect and reconnect the "Trans." fuse in the module harness.

SENSORS

Sensors include:

- throttle position sensor (TPS)
- transmission speed sensor
- vehicle speed sensor
- park/neutral position switch
- brake switch

OPERATION

The throttle position sensor is mounted on the throttle body. It electronically determines throttle position and relays this information to the transmission control module to determine shift points and converter clutch engagement.

The transmission speed sensor consists of a rotor and magnet on the transmission output shaft and a switch in the extension housing or adapter. The sensor switch is activated each time the rotor and magnet complete one revolution. Sensor signals are sent to the transmission control module.

The park/neutral position switch is mounted on the valve body manual shaft. The switch signals shift linkage and manual valve position to the transmission control module through an interconnecting harness. The switch prevents engine starting in all gears other than Park or Neutral.

The brake switch is in circuit with the torque converter clutch solenoid. The switch disengages the converter clutch whenever the brakes are applied. The switch is mounted on the brake pedal bracket and signals the transmission control module when the pedal is pressed or released.

HYDRAULIC SYSTEM

DESCRIPTION

The hydraulic system consists of the pump, valve body and solenoids, and four hydraulic accumulators. The oil pump provides lubrication and operating pressure.

The valve body controls application of the clutches, brakes, second coast band, and the converter clutch. The valve body solenoids control sequencing of the 1-2, 2-3 and 3-4 shift valves. The solenoids are activated by signals from the transmission control module.

The accumulators are used in the clutch and brake feed circuits to control initial apply pressure. Spring loaded accumulator pistons modulate the initial surge of apply pressure for smooth engagement.

TRANSMISSION COOLER

DESCRIPTION

MAIN COOLER

The transmission main cooler is located in the radiator. The main cooler can be flushed when necessary, however, the cooler is not a repairable component. If the cooler is damaged, plugged, or leaking, the radiator will have to be replaced.

AUXILIARY COOLER

The auxiliary cooler is mounted in front of the radiator at the driver side of the vehicle (Fig. 36). The cooler can be flushed when necessary, while mounted in the vehicle. The cooler can also be removed for access, repair, or replacement as needed.

The main and auxiliary coolers should both be flushed whenever a transmission or converter clutch

malfunction generates sludge, debris, or particles of clutch friction material.

COOLER SERVICE

The main cooler (and radiator) and the auxiliary cooler can be removed for service or access to other components. Auxiliary cooler removal requires that the front bumper and radiator support be removed for access to the cooler lines and attaching bracket.

BRAKE TRANSMISSION SHIFT INTERLOCK MECHANISM**DESCRIPTION**

The Brake Transmission Shifter/Ignition Interlock (BTISI), is a cable and solenoid operated system. It interconnects the automatic transmission floor mounted shifter to the steering column ignition switch (Fig. 37).

OPERATION

The system locks the shifter into the PARK position. The Interlock system is engaged whenever the ignition switch is in the LOCK or ACCESSORY position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half an inch. A magnetic holding device in line with the park/brake interlock cable is energized when the ignition is in the RUN position. When the key is in the RUN position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK or ACCESSORY position (Fig. 38) unless the shifter is fully locked into the PARK position.

DIAGNOSIS AND TESTING

GENERAL DIAGNOSIS INFORMATION

Shift points are controlled by the transmission control module (TCM). Before attempting repair, determine if a malfunction is electrical or mechanical.

The TCM used with the AW-4 transmission has a self-diagnostic program compatible with the DRBIII scan tool. The tester will identify faults in the electrical control system.

Diagnosis should begin with the Preliminary Inspection And Adjustment procedure. It will help determine if a problem is mechanical or electrical. The first procedure step is Initial Inspection and Adjustment.

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal.

DIAGNOSIS AND TESTING (Continued)

J8921-423

Preliminary Diagnosis Check Procedure

If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve, clutch and servo operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed

drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid

DIAGNOSIS AND TESTING (Continued)

- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission for some time, an overhaul may also be necessary; especially if shift problems had developed.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

PRELIMINARY INSPECTION AND ADJUSTMENT

- (1) Check and adjust transmission shift cable if necessary.
- (2) Verify transmission throttle cable operation. Repair or replace cable if necessary.
- (3) Check engine throttle operation. Operate accelerator pedal and observe injector throttle plate movement. Adjust linkage if throttle plate does not reach wide open position.
- (4) Check transmission fluid level when fluid is at normal operating temperature. Start engine. Shift transmission through all gear ranges then back to Neutral. Correct level is to Full or Add mark on dipstick with engine at curb idle speed.
- (5) Check and adjust park/neutral position switch if necessary.

- (6) Check throttle position sensor adjustment and operation. Adjust the sensor if necessary.

MANUAL SHIFTING TEST

- (1) This test determines if problem is related to mechanical or electrical component.
- (2) Stop engine and disconnect transmission control module or module fuse.
- (3) Road test vehicle. Shift transmission into each gear range. Transmission should operate as follows:
 - lock in Park
 - back up in Reverse
 - not move in Neutral
 - provide first gear only with shift lever in 1-2 position
 - operate in third gear only with shift lever in 3 position
 - operate in overdrive fourth gear in D position
- (4) If transmission operates as described, proceed to next step. However, if forward gear ranges were difficult to distinguish (all feel the same), or vehicle would not back up, refer to diagnosis charts. Do not perform stall or time lag tests.

CAUTION: Do not over speed the engine during the next test step. Ease off the throttle and allow the vehicle to slow before downshifting.

- (5) Continue road test. Manually downshift transmission from D to 3, and from 3 to 1-2 position. Then manually upshift transmission through forward ranges again.

- (6) If transmission operation is OK, perform stall, time lag and pressure tests. If transmission shifting problem is encountered, refer to diagnosis charts.

- (7) If a problem still exists, continue testing with DRB scan tool.

HYDRAULIC PRESSURE TEST

Pressure Test Procedure

- (1) Connect pressure test gauge to test port on passenger side of transmission (Fig. 39). Use Adapter 7554 to connect gauge. Be sure test gauge has minimum capacity of 300 psi (2100 kPa).
- (2) Be sure transmission fluid is at normal operating temperature.
- (3) Apply parking brakes and block wheels.

WARNING: DO NOT ALLOW ANYONE TO STAND AT THE FRONT OR REAR OF THE VEHICLE WHILE PERFORMING THE FOLLOWING STEPS IN THE PRESSURE TEST.

- (4) Check and adjust engine curb idle speed.
- (5) Apply (and hold) service brakes.

DIAGNOSIS AND TESTING (Continued)

J8921-424

Fig. 39 Pressure Test Gauge Connection

- 1 - PRESSURE GAUGE
2 - TEST PORT

(6) Shift transmission into D range and note line pressure with engine at curb idle speed. Pressure should be 61-to-70 psi (421-to-481 kPa).

(7) Press accelerator pedal to wide open throttle position and note line pressure. Pressure should be 173-to-209 psi (1196-to-1442 kPa).

CAUTION: Do not hold wide open throttle for more than 3-4 seconds at a time.

(8) Shift transmission into Reverse and note line pressure with engine at curb idle speed. Pressure should be 75-to-90 psi (519-to-618 kPa).

(9) Press accelerator to wide open throttle position and note line pressure in Reverse. Pressure should be 213-to-263 psi (1471-to-1814 kPa).

CAUTION: Do not hold wide open throttle for more than 4 seconds.

(10) If line pressure is not within specifications, adjust transmission throttle cable and repeat pressure test.

PRESSURE TEST ANALYSIS

If pressures in D and Reverse are higher than specified in test, check for the following:

- throttle cable loose, worn, binding or out of adjustment
- throttle valve, downshift plug, throttle cam, or primary regulator valve are sticking, worn or damaged

If pressures in D and Reverse are lower than specified in test, check for following:

- throttle cable loose, worn, binding or out of adjustment
- throttle valve, downshift plug, or throttle cam sticking, worn or damaged
- primary regulator valve sticking, worn, or damaged
- oil pump gears or housing worn, or damaged
- overdrive clutch worn, or damaged

If pressures are low in D range only, check for following:

- forward clutch worn or damaged
- fluid leakage in D range circuit (component seal and O-rings)

If pressures are low in Reverse only, check for following:

- shift cable and manual valve out of adjustment
- fluid leakage in reverse circuit (component seal and O-rings)
- direct clutch worn or damaged
- first/reverse brake worn or damaged

TIME LAG TEST

This test checks general condition of the overdrive clutch, forward clutch, rear clutch and first/reverse brake. Condition is indicated by the amount of time required for clutch/brake engagement with the engine at curb idle speed. Engagement time is measured for D and Reverse positions. A stop watch is recommended for test accuracy.

TEST PROCEDURE

(1) Check and adjust transmission fluid level if necessary.

(2) Bring transmission to normal operating temperature.

(3) Apply parking brakes and turn off air conditioning unit.

(4) Shift transfer case into 2H range.

(5) Start engine and check curb idle speed. Adjust speed if necessary. Curb idle must be correct to ensure accurate test results.

(6) Shift transmission into Neutral and set stop watch.

(7) During following test steps, start stop watch as soon as shift lever reaches D and Reverse ranges.

(8) Shift transmission into D range and record time it takes for engagement. Repeat test two more times.

(9) Reset stop watch and shift transmission back to Neutral.

(10) Shift transmission into Reverse and record time it takes for engagement. Repeat test two more times.

DIAGNOSIS AND TESTING (Continued)

(11) Engagement time in D range should be a maximum of 1.2 seconds. Engagement time for Reverse should be a maximum of 1.5 seconds.

TIME LAG TEST ANALYSIS

If engagement time is longer than specified for D range, check for the following:

- shift cable misadjusted
- line pressure low

- forward clutch worn
 - overdrive clutch worn or damaged
- If engagement time is longer than specified for Reverse, check for the following:
- shift cable misadjusted
 - line pressure low
 - direct clutch worn
 - first/reverse brake worn
 - overdrive clutch worn or damaged

SERVICE DIAGNOSIS

DIAGNOSIS TABLE

CONDITION	POSSIBLE CAUSE	CORRECTION
VEHICLE WILL NOT BACK UP OR MOVE FORWARD	Shift cable out of adjustment or damaged Valve body or primary regulator faulty Park lock pawl faulty Torque converter faulty Converter drive plate broken Oil pump intake screen blocked Transmission faulty	Adjust cable or replace cable Inspect/repair valve body Repair park pawl Replace torque converter Replace drive plate Clean screen Disassemble and repair transmission
SHIFT LEVER POSITION INCORRECT	Shift cable out of adjustment Manual valve and lever faulty	Adjust cable Repair valve body
HARSH ENGAGEMENT	Throttle cable out of adjustment Valve body or primary regulator faulty Accumulator pistons faulty Transmission faulty	Adjust throttle cable Repair valve body Repair pistons Disassemble and repair transmission
DELAYED 1-2, 2-3 OR 3-4 UP-SHIFT, OR DOWN-SHIFTS FROM 4-3 OR 3-2 AND SHIFTS BACK TO 4 OR 3	Electronic control problem Valve body faulty Solenoid faulty	Locate problem with DRB Tester Repair valve body Repair solenoid
SLIPS ON 1-2, 2-3 OR 3-4 UP-SHIFT, OR SLIPS OR SHUDDERS DURING ACCELERATION	Shift cable out of adjustment Throttle cable out of adjustment Valve body faulty Solenoid faulty Transmission faulty	Adjust cable Adjust cable Repair valve body Replace solenoid Disassemble and repair transmission

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
DRAG OR BIND ON 1-2, 2-3 OR 3-4 UP-SHIFT	Shift cable out of adjustment Valve body faulty Transmission faulty	Adjust cable Repair valve body Disassemble and repair transmission
CONVERTER CLUTCH DOES NOT ENGAGE IN 2ND, 3RD OR 4TH	Electronic control problem Valve body faulty Solenoid faulty Transmission faulty	Check with DRB Tester Repair valve body Replace solenoid Disassemble and repair transmission
HARSH DOWN-SHIFT	Throttle cable out of adjustment Throttle cable and cam faulty Accumulator pistons faulty Valve body faulty Transmission faulty	Adjust cable Replace cable and cam Repair pistons Repair valve body Disassemble and repair transmission
NO DOWN-SHIFT WHEN COASTING	Valve body faulty Solenoid faulty Electronic control problem	Repair valve body Replace solenoid Locate problem with DRB Tester
DOWN-SHIFT LATE OR EARLY DURING COAST	Throttle cable faulty Valve body faulty Transmission faulty	Replace cable Repair valve body Disassembly and repair transmission
NO 4-3, 3-2 OR 2-1 KICKDOWN	Solenoid faulty Electronic control problem Solenoid faulty Electronic control problem Valve body faulty	Replace solenoid Locate problem with DRB Tester Replace solenoid Locate problem with DRB Tester Repair valve body
NO ENGINE BRAKING IN 1-2 POSITION	Solenoid faulty Electronic control problem Valve body faulty Transmission faulty	Replace solenoid Locate problem with DRB Tester Repair valve body Disassemble and repair transmission
VEHICLE DOES NOT HOLD IN PARK	Shift cable out of adjustment Parking lock pawl cam and spring faulty	Adjust cable Replace cam and spring
OVERHEAT DURING NORMAL OPERATION (FLUID DISCOLORED, SMELLS BURNED)	Low fluid level Fluid cooler, lines blocked, or cooler cracked (oil in engine coolant)	Add fluid and check for leaks Flush cooler and lines and replace radiator if transmission fluid has entered coolant

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
OVERHEAT DURING COMMERCIAL OPERATION OR WHILE TRAILER TOWING (FLUID DARK AND BURNED WITH SOME SLUDGE FORMATION)	Vehicle not properly equipped for trailer towing or commercial use	Be sure vehicle is equipped with recommended optional components (i.e. HD springs, transmission, axle, larger CID engine, auxiliary cooler, correct axle ratio, etc.). If vehicle is not so equipped, it should not be used for severe service operation
	Vehicle not equipped with auxiliary fluid cooler	Drain fluid, change filter, and install auxiliary cooler
	Extensive idling time or operation in heavy traffic in hot weather	Cut down on idling time; shift into neutral every so often and run engine at 1000 rpm to help circulate fluid through cooler
	Tow vehicle overloaded (exceeding vehicle tow capacity)	Be sure vehicle is properly equipped to handle load; do not tow Class III-type loads with a vehicle that is only rated for Class I or II operation
	Air flow to auxiliary cooler blocked by snow plow, front mounted spare tire, bug screen, or similar item	Remove or reposition item causing air flow blockage
OIL COMES OUT FILLER TUBE	Transmission overfilled	Drain fluid to correct level; remove neutral switch and drain through switch hole with suction gun
	Breather vent in oil pump blocked	Inspect and clear blockage
	Fluid cooler or cooler lines plugged	Flush cooler and lines

TRANSMISSION SOLENOID TESTING

Test solenoid resistance with an ohmmeter. Connect the ohmmeter leads to the solenoid mounting bracket and to the solenoid wire terminal (Fig. 40).

Solenoid resistance should be 11–15 ohms. Replace the solenoid if resistance is above or below the specified range.

PARK/NEUTRAL POSITION SWITCH

SWITCH TESTING

Test switch continuity with an ohmmeter. Disconnect the switch and check continuity at the connector terminal positions and in the gear ranges indicated in Figure 3. Switch continuity should be as follows:

- Continuity should exist between terminals B and C with the transmission in Park and Neutral only (Fig. 41).
- Continuity should exist between terminals A and E with the transmission in Reverse (Fig. 41).
- Continuity should exist between terminals A and G with the transmission in third gear (Fig. 41).
- Continuity should exist between terminals A and H with the transmission in first and/or second gear (Fig. 41).

J8921-435

Fig. 40 Testing Transmission Valve Body Solenoid

- 1 – OHMMETER
2 – WIRE TERMINAL
3 – SOLENOID

- Continuity should not exist in D position.

DIAGNOSIS AND TESTING (Continued)

80c070ae

Fig. 41 Park/Neutral Position Switch Terminals And Testing

GEARSHIFT CABLE

(1) The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.

(2) Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.

(3) With floor shift lever handle push-button not depressed and lever in:

(a) PARK position—Apply forward force on center of handle and remove pressure. Engine starts must be possible.

(b) PARK position—Apply rearward force on center of handle and remove pressure. Engine starts must be possible.

(c) NEUTRAL position—Normal position. Engine starts must be possible.

(d) NEUTRAL position—Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from neutral to reverse.

THROTTLE VALVE CABLE

Transmission throttle valve cable adjustment is extremely important to proper operation. This adjustment positions the throttle valve, which controls shift speed, quality, and part-throttle downshift sensitivity.

If cable setting is too loose, early shifts and slip-page between shifts may occur. If the setting is too tight, shifts may be delayed and part throttle down-

shifts may be very sensitive. Refer to the Adjustments section for the proper adjustment procedure.

SPEED SENSOR TESTING

Test the speed sensor with an ohmmeter. Place the ohmmeter leads on the terminals in the sensor connector (Fig. 42).

Rotate the transmission output shaft and observe the ohmmeter needle. The needle should deflect indicating the switch is opening/closing as the rotor moves past the sensor (Fig. 42). Replace the sensor if the ohmmeter does not display any kind of reading.

J8921-462

Fig. 42 Speed Sensor Testing

- 1 - CONNECTOR
- 2 - OHMMETER
- 3 - SENSOR
- 4 - SENSOR SWITCH
- 5 - ROTOR

If a digital ohmmeter is being used, the sensor should generate an ohmmeter readout each time the switch opens and closes.

FLOW TESTING TRANSMISSION MAIN COOLER

Cooler flow is checked by measuring the amount of fluid flow through the cooler in a 20 second time period. The test is performed with the engine running and transmission in neutral. Fluid is then pumped through the cooler by the transmission oil pump.

(1) Disconnect cooler inlet line at transmission fitting.

DIAGNOSIS AND TESTING (Continued)

- (2) Securely attach hose to end of inlet line and position line in a one quart test container.
- (3) Add extra quart of fluid to transmission.
- (4) Use stopwatch to check flow test time.
- (5) Shift transmission into neutral and set parking brake.
- (6) Start and run engine at curb idle speed and immediately note cooler flow. Approximately one quart of fluid should flow into test container in 20 second period.
- (7) If cooler flow is intermittent, flows less than one quart in 20 seconds, or does not flow at all, cooler is faulty and must be replaced.

TORQUE CONVERTER STATOR CLUTCH INSPECTION

- (1) Insert Rotating Tool 7547 into converter hub and seat tool in one-way clutch (Fig. 43).
- (2) Insert Stopper Tool 7548 in one converter hub notch and into outer race of rotating tool.
- (3) Turn rotating tool clockwise. Converter clutch should rotate freely and smoothly. Less than 2.5 N·m (22 in. lbs.) of torque should be required to rotate clutch in clockwise direction.
- (4) Turn rotating tool in counterclockwise direction. Converter clutch should lock.
- (5) Replace converter if clutch binds or will not lock.

SERVICE PROCEDURES

CHECKING FLUID LEVEL

- (1) Be sure transmission fluid is at normal operating temperature. Normal operating temperature is reached after approximately 15 miles (25 km) of operation.
- (2) Position vehicle on level surface. This is important for an accurate fluid level check.
- (3) Shift transmission through all gear ranges and back to Park.
- (4) Apply parking brakes.
- (5) Verify that transmission is in Park.
- (6) Wipe off dipstick handle to prevent dirt from entering fill tube. Then remove dipstick and check fluid level and condition.
- (7) Correct fluid level is **to FULL mark on dipstick when fluid is at normal operating temperature** (Fig. 44).
- (8) If fluid level is low, top off level with Mopar Dexron IIE/Mercon. Mopar Dexron II can be used but only if Mercon is not available. **Do not overfill transmission. Add only enough fluid to bring level to Full mark.**
- (9) If too much fluid was added, excess amount can be removed with suction gun and appropriate diame-

J8921-470

Fig. 43 Checking Operation Of Torque Converter Stator One-Way Clutch

SERVICE PROCEDURES (Continued)

J8921-427

Fig. 44 Transmission Fluid Level

ter plastic tubing. Tubing only has to be long enough to extend into oil pan.

CHECKING FLUID CONDITION

Inspect the appearance of the fluid during the fluid level check. Fluid color should range from dark red to pink and be free of foreign material, or particles. If the fluid is dark brown or black in color and smells burnt, the fluid has been overheated and must be changed.

Transmission operation should also be checked if the fluid is severely discolored and contains quantities of foreign material, metal particles, or clutch disc friction material.

A small quantity of friction material or metal particles in the oil pan is normal. The particles are usually generated during the break-in period and indicate normal seating of the various transmission components.

REFILLING AFTER OVERHAUL OR FLUID/FILTER CHANGE

The best way to refill the transmission after a fluid change or overhaul is as follows:

- (1) If transmission has been overhauled, install transmission in vehicle.
- (2) Remove dipstick and insert clean funnel in transmission fill tube.
- (3) Add following initial quantity of Mopar Dexron IIE/Mercon to transmission:
- (4) If fluid/filter change was performed, add **4 pints (2 quarts)** of fluid to transmission.
 - (a) If transmission was completely overhauled and torque converter was replaced or drained, add **10 pints (5 quarts)** of fluid to transmission.
 - (b) Remove funnel and install dipstick.
- (5) Operate vehicle until fluid reaches normal operating temperature.
- (6) Apply parking brakes.
- (7) Let engine run at normal curb idle speed, apply service brakes. Then shift transmission through all gear ranges and back to PARK (leave engine running).
- (8) Remove dipstick and check fluid level. Add only enough fluid to bring level to Full mark on dipstick.

Do not overfill. **If too much fluid is added, excess amount can be removed with suction gun and plastic tubing. Tubing only has to be long enough to extend into oil pan.**

(9) When fluid level is correct, shut engine off, release park brake, remove funnel, and reseal dipstick in fill tube.

TRANSMISSION CONTROL MODULE (TCM) SERVICE

Use the DRB scan tool to diagnose transmission control module function whenever a fault is suspected. Replace the module only when the scan tool indicates the module is actually faulty.

OIL PUMP VOLUME CHECK

Measuring the oil pump output volume will determine if sufficient oil flow to the transmission oil cooler exists, and whether or not an internal transmission failure is present.

Verify that the transmission fluid is at the proper level. Refer to the Fluid Level Check procedure in this section. If necessary, fill the transmission to the proper level with Mopar® ATF+3, type 7176, Automatic Transmission Fluid.

(1) Disconnect the **To cooler** line at the cooler inlet and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If one quart of transmission fluid is collected in the container in 20 seconds or less, oil pump flow volume is within acceptable limits. If fluid flow is intermittent, or it takes more than 20 seconds to collect one quart of fluid, refer to the Hydraulic Pressure tests in this section for further diagnosis.

(4) Re-connect the **To cooler** line to the transmission cooler inlet.

(5) Refill the transmission to proper level.

FLUSHING COOLERS AND TUBES

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

The only recommended procedure for flushing coolers and lines is to use Tool 6906A Cooler Flusher.

SERVICE PROCEDURES (Continued)

CAUTION: The transmission oil cooler requires a two stage flushing procedure due to an internally mounted thermostat. Failure to follow the procedure can result in severe transmission damage.

WARNING: WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1-1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES.

KEEP LIGHTED CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.

KEEP THE AREA WELL VENTILATED.

DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR 15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.

COOLER FLUSH USING TOOL 6906A

(1) Remove cover plate filler plug on Tool 6906A. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906A.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, **ALWAYS** reverse flush.

NOTE: The converter drainback valve must be removed and an appropriate replacement hose installed to bridge the space between the transmission cooler line and the cooler fitting. Failure to remove the drainback valve will prevent reverse flushing the system. A suitable replacement hose can be found in the adapter kit supplied with the flushing tool.

(5) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Remove the transmission oil cooler from the vehicle. Refer to the Group 7, Cooling System, for the proper procedures.

(8) Remove the transmission oil cooler thermostat. Refer to the Group 7, Cooling System, for the proper procedures.

(9) Re-install the thermostat cover onto the oil cooler and install the snap ring.

(10) Re-connect the oil cooler to the transmission cooler lines.

(11) Turn pump ON for two to three minutes to flush cooler(s) and lines.

NOTE: This flushes the bypass circuit of the cooler only.

(12) Turn pump OFF.

(13) Remove the thermostat cover from the oil cooler.

(14) Install Special Tool Cooler Plug 8414 into the transmission oil cooler.

(15) Turn pump ON for two to three minutes to flush cooler(s) and lines.

NOTE: This flushes the main oil cooler core passages only.

(16) Turn pump OFF.

(17) Remove the thermostat cover from the oil cooler.

(18) Remove Special Tool Cooler Plug 8414 from the transmission oil cooler.

(19) Install a new thermostat spring, thermostat, cover, and snap-ring into the transmission oil cooler.

(20) Install the transmission oil cooler onto the vehicle.

(21) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(22) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(23) Place CLEAR suction line into a one quart container of Mopar® ATF Plus 3, type 7176 automatic transmission fluid.

(24) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(25) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil tap, or equivalent, and installing a Heli-Coil insert, or equivalent,

SERVICE PROCEDURES (Continued)

into the hole. This brings the hole back to its original thread size.

Heli-Coil, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL AND INSTALLATION

TRANSMISSION AND TORQUE CONVERTER

REMOVAL

- (1) Raise vehicle.
- (2) Drain transmission fluid and reinstall oil pan drain plug.
- (3) On models with 2-piece fill tube, remove upper half of tube (Fig. 45).

Fig. 45 Transmission Fill Tube (Two-Piece)

- 1 - UPPER HALF
- 2 - TRANSMISSION FILL TUBE
- 3 - LOWER HALF

- (4) Disconnect cooler lines at transmission.
- (5) Support engine with safety stand and support transmission with jack.

(6) Disconnect transmission and transfer case shift linkage.

(7) Remove necessary exhaust components.

(8) Disconnect vehicle speed sensor wires

(9) Mark position of front and rear propeller shafts for alignment reference. Then remove shafts from vehicle.

(10) Remove rear crossmember.

(11) Disconnect transmission shift cable at transmission. Then disconnect transmission throttle valve cable at engine.

(12) Disconnect necessary vacuum and fluid hoses.

(13) Remove transfer case from transmission.

(14) Disconnect and remove crankshaft position sensor (Fig. 46).

CAUTION: The crankshaft position sensor can be damaged during transmission removal (or installation) if the sensor is still bolted to the engine block. To avoid damage, remove the sensor before removing the transmission.

Fig. 46 Crankshaft Position Sensor

- 1 - CRANKSHAFT POSITION SENSOR
- 2 - TRANSMISSION HOUSING

(15) Remove starter motor.

(16) Remove bolts attaching converter to drive plate.

(17) Remove bolts attaching converter housing to engine.

REMOVAL AND INSTALLATION (Continued)

(18) Secure transmission to jack with safety chains.

(19) Pull transmission rearward for access to converter. Then secure converter in pump with C-clamp or strap bolted to converter housing.

(20) Remove transmission from under vehicle.

(21) Remove torque converter if converter or oil pump seal are to be serviced.

INSTALLATION

(1) Mount transmission on transmission jack. Then secure transmission to jack with safety chains.

(2) Lubricate converter drive hub and oil pump seal lip with transmission fluid. Then install converter. Be sure converter is fully seated in oil pump gears before proceeding. Hold converter in place with C-clamp or strap attached to converter housing.

(3) Lubricate the pocket in the rear of the crankshaft, in which the converter pilot hub rides, with a light coating of Mopar® High-Temp Grease.

(4) Align and position transmission and converter on engine.

(5) Remove clamp or strap used to hold torque converter in place.

(6) Move transmission forward seat and it on engine. Be sure torque converter hub is fully seated.

(7) Install converter housing-to-engine bolts (Fig. 47).

(8) Install converter-to-drive plate bolts.

(9) Install and connect starter motor.

(10) Install and connect crankshaft position sensor.

(11) Install transfer case on transmission.

(12) Connect transfer case shift linkage and vacuum hoses.

(13) Connect exhaust components.

(14) Install rear crossmember and remove jack used to support transmission assembly.

(15) Connect speed sensor wire harness to sensor.

(16) Connect wire harness to park/neutral position switch.

(17) Align and connect front and rear propeller shafts.

(18) Connect transmission wire harnesses and transfer case vacuum and wire harnesses.

4 - BRACKET

5 - FILL TUBE O-RING

REMOVAL AND INSTALLATION (Continued)

- (19) Connect transmission cooler lines.
- (20) Connect transmission throttle cable at engine.
- (21) Install new O-ring seal on upper half of transmission fill tube. Then connect upper and lower tube halves.
- (22) Lower vehicle.
- (23) Fill transmission with Mopar® Dexron IIE/Mercon automatic transmission fluid.

TORQUE CONVERTER

REMOVAL

- (1) Remove transmission and torque converter from vehicle.
- (2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition.

The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

- (3) Pull the torque converter forward until the center hub clears the oil pump seal.
- (4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

- (1) Lubricate converter hub and oil pump seal lip with transmission fluid.
- (2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

- (3) Align torque converter to oil pump seal opening.
- (4) Insert torque converter hub into oil pump.
- (5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
- (6) Check converter seating with a scale and straightedge (Fig. 48). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.
- (7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

- (8) Install the transmission in the vehicle.
- (9) Fill the transmission with the recommended fluid.

Fig. 48 Checking Torque Converter Seating

- 1 - SCALE
- 2 - STRAIGHTEDGE

ADAPTER HOUSING SEAL

REMOVAL

- (1) Raise vehicle.
- (2) Disconnect or remove components necessary to gain access to seal (e.g. propeller shaft, crossmember, shift linkage, transfer case, exhaust components, hoses, wires).
- (3) On 4X2 vehicles, remove dust shield from the adapter housing by tapping gently with a brass drift and hammer (Fig. 49).
- (4) On 4X2 vehicles, remove the adapter housing seal with Seal Puller 7550.
- (5) On 4X4 vehicles, remove the adapter housing seal using a slide hammer mounted screw.

INSTALLATION

- (1) Install new adapter housing seal with Seal Installer 7888.
- (2) On 4X2 vehicles, install dust shield using Special Tool D-187-B.
- (3) Reinstall components removed to gain access to seal.
- (4) Top off transmission fluid if necessary.

SPEED SENSOR

REMOVAL

- (1) Disconnect sensor wire harness connector.

REMOVAL AND INSTALLATION (Continued)

J9121-379

Fig. 49 Adapter Housing Seals

- 1 - 4WD ADAPTER HOUSING
- 2 - SEAL
- 3 - BUSHING
- 4 - OIL TUBE
- 5 - 2WD EXTENSION HOUSING
- 6 - SEAL
- 7 - SPEED SENSOR
- 8 - SPEED SENSOR

(2) Remove sensor retainer bolt and remove sensor (Fig. 50).

(3) Remove and discard speed sensor O-ring.

INSTALLATION

(1) Install new O-ring on speed sensor and install sensor in transmission case.

(2) Install sensor bracket and retainer bolt. Tighten bolt to 7.4 N·m (65 in. lbs.) torque.

(3) Connect sensor wire harness connector.

SPEEDOMETER ADAPTER

Rear axle gear ratio and tire size determine speedometer pinion requirements.

REMOVAL

(1) Raise vehicle.

(2) Disconnect wires from vehicle speed sensor.

(3) Remove adapter clamp and screw (Fig. 51).

(4) Remove speed sensor and speedometer adapter as assembly.

(5) Remove speed sensor retaining screw and remove sensor from adapter.

(6) Remove speedometer pinion from adapter.

J8921-463

Fig. 50 Transmission Speed Sensor Removal/Installation

- 1 - RETAINER BOLT
- 2 - SPEED SENSOR

(7) Inspect sensor and adapter O-rings (Fig. 51). Remove and discard O-rings if worn or damaged.

(8) Inspect terminal pins in speed sensor. Clean pins with Mopar® electrical spray cleaner if dirty or oxidized. Replace sensor if faulty, or pins are loose, severely corroded, or damaged.

INSTALLATION

(1) Thoroughly clean adapter flange and adapter mounting surface in housing. Surfaces must be clean for proper adapter alignment and speedometer operation.

(2) Install new O-rings on speed sensor and speedometer adapter if necessary (Fig. 51).

(3) Lubricate sensor and adapter O-rings with transmission fluid.

(4) Install vehicle speed sensor in speedometer adapter. Tighten sensor attaching screw to 2-3 N·m (15-27 in. lbs.) torque.

(5) Install speedometer pinion in adapter.

(6) Count number of teeth on speedometer pinion. Do this before installing assembly in housing. Then lubricate pinion teeth with transmission fluid.

(7) Note index numbers on adapter body (Fig. 52). These numbers will correspond to number of teeth on pinion.

(8) Install speedometer assembly in housing.

(9) Rotate adapter until required range numbers are at 6 o'clock position. Be sure range index numbers correspond to number of teeth on pinion gear.

REMOVAL AND INSTALLATION (Continued)

(10) Install speedometer adapter clamp and retaining screw. Tighten clamp screw to 10-12 N·m (90-110 in. lbs.) torque.

(11) Connect wires to vehicle speed sensor.

(12) Lower vehicle and top off transmission fluid level, if necessary.

SPEED SENSOR ROTOR-SPEEDOMETER DRIVE GEAR

REMOVAL

(1) Raise vehicle.

(2) Remove components necessary to gain access to rotor and drive gear such as propeller shaft, transfer case, crossmember, and shift linkage.

(3) Disengage wire connector from the output speed sensor.

(4) Remove the bolt holding the output speed sensor to the adapter housing.

(5) Remove the output speed sensor from the adapter housing.

(6) Remove the bolts holding the adapter housing to the transmission case.

(7) Tap the adapter housing at the joint line gently with a rubber mallet to separate the adapter housing from the transmission case.

(8) Remove the adapter housing from the transmission case.

J9321-386

Fig. 52 Index Numbers On Speedometer Pinion Adapter

- 1 - SPEEDOMETER ADAPTER
2 - INDEX NUMBER LOCATION

(9) Remove speedometer drive gear snap ring (Fig. 53).

(10) Remove the speedometer drive gear and spacer, if equipped.

(11) Remove rotor from the output shaft. It may be necessary to use a wood dowel or hammer handle (Fig. 54) to gently pry the rotor from the output

ITEM	TORQUE
A	2-3 N·m (15-27 in. lbs.)
B	10-12 N·m (90-110 in. lbs.)

shaft. Be sure to retrieve the rotor locating key from the output shaft or rotor.

80c070b0

Fig. 54 Removing Speed Sensor Rotor

- 1 - WOOD DOWEL OR HAMMER HANDLE
2 - ROTOR
3 - OUTPUT SHAFT

INSTALLATION

(1) Clean sealing surfaces of transmission case and extension/adaptor housing.

(2) Install rotor, spacer (if equipped) and drive gear on output shaft. Then install drive gear snap ring (Fig. 53).

(3) Apply 1/8 3/16 inch wide bead of Threebond® Liquid Gasket TB1281, P/N 83504038, to transmission case sealing surface and install extension/adaptor housing on case.

(4) Tighten adaptor housing bolts to 34 N·m (25 ft. lbs.) torque.

(5) Install components removed to gain access to rotor and drive gear.

PARK/NEUTRAL POSITION SWITCH

REMOVAL

(1) Raise vehicle.

(2) Disconnect switch wire harness connector.

(3) Pry washer lock tabs upward and remove switch attaching nut and tabbed washer (Fig. 55).

(4) Remove switch adjusting bolt (Fig. 55).

(5) Slide switch off manual valve shaft.

J8921-430

Fig. 55 Park/Neutral Position Switch Removal/Installation

- 1 - ADJUSTING BOLT
2 - ATTACHING NUT
3 - NEUTRAL SWITCH
4 - TABBED WASHER

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

- (1) Disconnect shift linkage rod from shift lever on left side of transmission.
- (2) Rotate manual shift lever all the way rearward. Then rotate lever forward two detent positions to Neutral.
- (3) Install switch on manual valve shaft and install switch adjusting bolt finger tight. Do not tighten bolt at this time.
- (4) Install tabbed washer on manual valve shaft and install switch attaching nut. Tighten nut to 6.9 N·m (61 in. lbs.) torque but do not bend washer lock tabs over nut at this time.
- (5) Verify that transmission is in Neutral.
- (6) Rotate switch to align neutral standard line with vertical groove on manual valve shaft (Fig. 56).
- (7) Align switch standard line with groove or flat

J8921-431

Fig. 56 Park/Neutral Position Switch Adjustment

- 1 - NEUTRAL STANDARD LINE
 2 - ADJUSTING BOLT
 3 - VERTICAL GROOVE ON MANUAL VALVE SHAFT

on manual valve shaft.

- (8) Tighten switch adjusting bolt to 13 N·m (9 ft. lbs.) torque.
- (9) Bend at least two washer lock tabs over switch attaching nut to secure it.
- (10) Connect shift linkage rod to shift lever on left side of case.
- (11) Connect switch wires to harness and lower vehicle.
- (12) Check switch operation. Engine should start in Park and Neutral only.

GEARSHIFT CABLE

REMOVAL

- (1) Shift transmission into Park.
- (2) Remove shift lever bezel and necessary console parts for access to shift lever assembly.
- (3) Disconnect cable at shift lever and feed cable through dash panel opening to underside of vehicle.
- (4) Raise vehicle.
- (5) Disengage cable eyelet at transmission shift lever and pull cable adjuster out of mounting bracket. Then remove old cable from vehicle.

INSTALLATION

- (1) Route cable through hole in dash panel. Fully seat cable grommet into dash panel.
- (2) Place the auto transmission manual shift control lever in "Park" detent (rearmost) position and rotate prop shaft to ensure transmission is in park.
- (3) Connect shift cable to shifter mechanism by snapping cable retaining ears into shifter bracket and press cable end fitting onto lever ball stud.
- (4) Place the floor shifter lever in park position. Ensure that the pawl is seated within the confines of the adjustment gauge clip.
- (5) Snap the cable into the transmission bracket so the retaining ears are engaged and connect cable end fitting onto the manual control lever ball stud.
- (6) Lock shift cable into position by pushing upward on the adjusting lock button.
- (7) Remove and discard the shift cable adjustment gauge clip from the park gate of the shifter.

BRAKE TRANSMISSION SHIFT INTERLOCK

REMOVAL

- (1) Remove lower steering column cover. Refer to Group 8E, Instrument Panel and Gauges, for proper procedure.
- (2) Remove lower steering column shroud. Refer to Group 19, Steering, for proper procedure.
- (3) Remove tie strap near the solenoid retaining the brake transmission interlock cable to the steering column.
- (4) Disengage wire connector from solenoid.
- (5) With the ignition removed or in the unlocked position, disengage lock tab holding cable end to steering column (Fig. 57).
- (6) Pull cable end from steering column.
- (7) Remove the floor console and related trim. Refer to Group 23, Body, for proper procedure.
- (8) Disconnect the cable eyelet from the bellcrank (Fig. 58).
- (9) Disconnect and remove the cable from the shift bracket.

REMOVAL AND INSTALLATION (Continued)

**Fig. 57 Brake/Park Interlock Cable**

- 1 - IGNITION LOCK
- 2 - LOCK TAB
- 3 - CABLE END

INSTALLATION

(1) Route replacement cable behind instrument panel and under floor console area to shift mechanism (Fig. 58).

(2) Insert cable end into opening in steering column hub under ignition lock. Push cable inward until lock tab engages.

(3) Connect the cable end eyelet onto shifter bellcrank pin.

(4) Place gear selector in PARK.

(5) Push the spring-loaded cable adjuster forward and snap cable into bracket.

(6) Adjust the brake transmission shifter interlock cable. Refer to the Adjustment portion of this section for proper procedures.

(7) Verify that the cable adjuster lock clamp is pushed downward to the locked position.

(8) Test the park-lock cable operation.

(9) Install the floor console and related trim.

**Fig. 58 Cable and Shifter**

80a13876

REMOVAL AND INSTALLATION (Continued)

- (10) Install tie strap to hold cable to base of steering column.
- (11) Install lower steering column shroud and ignition lock.
- (12) Install lower steering column cover.

TRANSMISSION VALVE BODY SOLENOIDS

REMOVAL

- (1) Remove transmission oil pan drain plug and drain fluid.
- (2) Remove pan bolts and remove oil pan.
- (3) Remove oil screen bolts and remove screen (Fig. 59) and gasket. Discard the gasket.

**Fig. 59 Oil Screen Removal/Installation**

- 1 - OIL SCREEN BOLTS
2 - OIL SCREEN

- (4) Disconnect solenoid wire connector (Fig. 60).
- (5) If all solenoids are being removed, mark or tag wires for assembly reference before disconnecting them.
- (6) Remove bolt attaching solenoids to valve body and remove solenoids (Fig. 61). Do not allow any valve body components to fall out when solenoids are removed.
- (7) Clean oil filter and pan with solvent and dry with compressed air.
- (8) Remove old sealer material from oil pan and transmission case.

INSTALLATION

- (1) Position solenoids on valve body and install solenoid bolts. Tighten bolts to 10 N·m (7 ft. lbs.) torque.
- (2) Connect feed wires to solenoids.
- (3) Install new gaskets on oil screen and install screen. Tighten screen bolts to 10 N·m (7 ft. lbs.) torque.

J8921-433

Fig. 60 Solenoid Wire Connectors

- 1 - SOLENOID WIRE CONNECTORS

**Fig. 61 Transmission Valve Body Solenoids**

- 1 - VALVE BODY SOLENOIDS

- (4) Apply bead of Threebond® Liquid Gasket TB1281, P/N 83504038, sealer to oil pan sealing surface. Sealer bead should be at least 3.0 mm (1/8 in.) wide.
- (5) Install oil pan on transmission. Tighten pan bolts to 7 N·m (65 in. lbs.) torque.
- (6) Install and tighten oil pan drain plug to 20 N·m (15 ft. lbs.) torque.
- (7) Fill transmission with Mopar® Dexron IIE/Mercon.

REMOVAL AND INSTALLATION (Continued)

TRANSMISSION VALVE BODY

REMOVAL

- (1) Remove oil pan plug and drain transmission fluid.
- (2) Remove oil pan and oil screen. Clean pan and screen in solvent and dry them with compressed air.
- (3) Disconnect solenoid wire connectors (Fig. 62). Mark wires for assembly reference.

J8921-433

Fig. 62 Solenoid Wire Connectors

1 - SOLENOID WIRE CONNECTORS

- (4) Remove valve body oil tubes (Fig. 63). Carefully pry tubes out of valve body with screwdriver.
- (5) Disconnect throttle cable from throttle cam (Fig. 64).
- (6) Remove valve body bolts. Bolt locations are outlined in (Fig. 65).
- (7) Lower valve body and remove overdrive clutch accumulator springs, direct clutch accumulator springs and second brake accumulator spring (Fig. 66).
- (8) Remove valve body and check ball and spring (Fig. 67).

INSTALLATION

- (1) Connect cable to throttle cam (Fig. 64).
- (2) Install check ball and spring (Fig. 67).
- (3) Position accumulator springs and spacers on valve body.
- (4) Align valve body manual valve with shift sector (Fig. 68) and carefully position valve body on case.
- (5) Install valve body bolts (Fig. 65). Tighten bolts evenly to 10 N·m (7 ft. lbs.) torque.

J8921-437

Fig. 63 Removing Transmission Valve Body Oil Tubes

1 - OIL TUBES

J8921-438

Fig. 64 Removing/Installing Throttle Cable

1 - THROTTLE CABLE
2 - CABLE BRACKET

- (6) Install valve body oil tubes. Be sure tube ends (L) and (M) are installed as shown in (Fig. 69).
- (7) Remove old sealer material from oil pan and transmission case.
- (8) Clean oil screen and oil pan with solvent (if not done previously). Dry both components with compressed air only. Do not use shop towels.
- (9) Install new gaskets on oil screen and install screen on case. Tighten screen attaching bolts to 10 N·m (7 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

module from the finish panel. Tighten the module mounting screws securely after installation. Also be sure the wire harness is not twisted, kinked or touching any body panels.

SOLENOID HARNESS ADAPTER SEAL

REMOVAL

- (1) Remove oil pan and oil screen.
- (2) Disconnect solenoid wire connectors (Fig. 72).

J8921-433

Fig. 72 Solenoid Wire Connectors

- 1 - SOLENOID WIRE CONNECTORS

- (3) Remove bracket securing solenoid harness adaptor (Fig. 73) to case.

J8921-436

Fig. 73 Harness Adapter Removal/Installation

- 1 - HARNESS ADAPTER
- 2 - BRACKET

- (4) Pull harness adapter and wires out of case.

REMOVAL AND INSTALLATION (Continued)

- (5) Remove and discard adapter O-ring.

INSTALLATION

- (1) Lubricate new O-ring and install it on adapter.
- (2) Install solenoid wire harness and adapter in case.
- (3) Install adapter bracket and bracket bolt.
- (4) Connect wires to solenoids.
- (5) Install oil screen.
- (6) Apply bead of Threebond® Liquid Gasket TB1281, P/N 83504038, to oil pan seal surface. Sealer bead should be at least 3 mm (1/8 in.) wide.
- (7) Install oil pan on transmission. Tighten pan bolts to 7 N·m (65 in. lbs.) torque.
- (8) Install and tighten oil pan drain plug to 20 N·m (15 ft. lbs.) torque.
- (9) Fill transmission with Mopar Dexron IIE/Mercon.

MANUAL VALVE SHAFT SEAL

REMOVAL

J8921-444

2 - MANUAL VALVE SHAFT

(8) Pry shaft seals out of case (Fig. 78).

J8921-448

Fig. 78 Removing Manual Valve Shaft Seals

- 1 - MANUAL VALVE SHAFT SEAL

INSTALLATION

(1) Inspect the manual valve shaft and sector. Replace either component if worn or damaged.

(2) Coat replacement shaft seals with petroleum jelly and seat them in the case using an appropriately sized driver/socket (Fig. 79).

J8921-449

Fig. 79 Installing Manual Valve Shaft Seals

- 1 - SHAFT SEAL INSTALLER

(3) Install new spacer sleeve on sector (Fig. 80).

J8921-450

Fig. 80 Installing Spacer Sleeve On Sector

- 1 - SHIFT SECTOR
2 - SPACER SLEEVE

(4) Lubricate manual valve shaft with petroleum jelly and install it through the left side of the transmission case.

REMOVAL AND INSTALLATION (Continued)

(5) Lubricate sector and sleeve with petroleum jelly and install them on shaft.

(6) Install the manual valve shaft through the remainder of the transmission case.

(7) Align hole in spacer sleeve with notch in sector. Then install shift sector roll pin. Tap pin into sector and shaft and securely stake sleeve to sector and shaft.

(8) Connect park rod to sector (Fig. 76).

(9) Install park rod bracket (Fig. 81). Tighten bracket bolts to 10 N·m (7 ft. lbs.) torque.

Fig. 81 Installing Park Rod Bracket

J8921-451

1 - PARK ROD BRACKET

(10) Install valve body, oil screen and oil pan.

(11) Install park/neutral position switch.

ACCUMULATOR PISTONS AND SPRINGS

REMOVAL

(1) Remove valve body.

(2) Remove accumulator pistons with compressed air (Fig. 82). Apply air through small feed hole next to each piston bore. Catch each piston in a shop towel as it exits bore.

CAUTION: Use only enough air pressure to ease each piston out of the bore. In addition, remove the pistons one at a time and tag the pistons and springs for assembly reference. Do not intermix them.

(3) Remove and discard piston O-ring seals. Then clean pistons and springs with solvent.

INSTALLATION

(1) Inspect pistons, springs and piston bores. Replace worn damaged pistons. Replace broken, col-

J8921-455

Fig. 82 Accumulator Piston Removal

1 - AIR GUN NOZZEL IN FEED HOLE

2 - PISTONS

lapsed or distorted springs. Replace case if piston bores are damaged.

(2) If small cushion spring in any piston must be replaced, remove spring retainer clip and remove spring from piston (Fig. 83). A small hooked tool or small thin blade screwdriver can be used to remove clip. A thin wall, deep socket, or pin punch can be used to seat clip after spring replacement.

J9121-414

Fig. 83 Small Cushion Spring Retention

1 - ACCUMULATOR PISTON (TYPICAL)

2 - SMALL CUSHION SPRING

3 - RETAINER CLIP

REMOVAL AND INSTALLATION (Continued)

(3) Install new O-ring seals on pistons. Lubricate seals and pistons and piston bores with transmission fluid.

(4) Install pistons and springs (Fig. 84).

- A. OVERDRIVE CLUTCH ACCUMULATOR PISTON AND SPRINGS
 B. OVERDRIVE BRAKE ACCUMULATOR PISTON AND SPRINGS
 C. DIRECT CLUTCH ACCUMULATOR PISTON AND SPRINGS
 D. SECOND BRAKE ACCUMULATOR PISTON AND SPRINGS

J9121-378

Fig. 84 Accumulator Pistons, Springs And Spacers

(5) Install valve body, oil screen and oil pan.

SECOND COAST BRAKE SERVO

REMOVAL

- (1) Remove valve body.
- (2) Remove servo piston cover snap ring with snap ring pliers (Fig. 85).
- (3) Remove servo piston and cover with compressed air. Apply compressed air through oil hole in servo boss to ease piston out of bore (Fig. 86).

J8921-457

- 4 - PISTON ROD
- 5 - PISTON SPRING
- 6 - SERVO COVER O-RINGS
- 7 - SERVO COVER
- 8 - SNAP RING
- 9 - E-RING

INSTALLATION

- (1) Install new seals on cover and piston.
- (2) Lubricate servo components with transmission fluid.
- (3) Assemble and install servo components in case. Be sure servo piston rod is properly engaged in the second coast brake band.
- (4) Compress cover and piston and install cover snap ring.
- (5) Install valve body, oil screen and oil pan.

PARK ROD AND PAWL

REMOVAL

- (1) Remove valve body as outlined in this section.
- (2) Remove bolts attaching park rod bracket to case (Fig. 88).
- (3) Remove park rod from manual valve shaft sector (Fig. 89).
- (4) Remove park rod.

J8921-451

Fig. 88 Removing/Installing Park Rod Bracket

J8921-446

Fig. 89 Removing/Installing Park Rod

- 1 - SHIFT SECTOR
- 2 - MANUAL VALVE SHAFT
- 3 - PARK ROD

REMOVAL AND INSTALLATION (Continued)

- (5) Remove park pawl, pin and spring (Fig. 90).

INSTALLATION

- (1) Examine park rod, pawl, pin and spring. Replace any component that is worn or damaged.
- (2) Install pawl in case. Insert pin and install spring. Be sure spring is positioned as shown in Figure 35.
- (3) Install park rod and bracket (Fig. 88). Tighten bracket bolts to 10 N·m (7 ft. lbs.) torque.
- (4) Install valve body, oil screen and oil pan.

TRANSMISSION THROTTLE CABLE

REMOVAL

- (1) In engine compartment, disconnect cable from throttle linkage. Then compress cable mounting ears and remove cable from engine bracket (Fig. 91).
- (2) Raise vehicle.
- (3) Remove transmission oil pan.
- (4) Disengage cable from throttle valve cam (Fig. 92).
- (5) Remove cable bracket bolt and remove cable and bracket from case (Fig. 93).
- (6) Remove and discard cable seal.

- 1 - THROTTLE CABLE
2 - CABLE BRACKET

J8921-452

Fig. 93 Removing/Installing Transmission Throttle Cable And Bracket

- 1 - THROTTLE CABLE
2 - CABLE BRACKET

INSTALLATION

- (1) Lubricate and install new seal on cable.
- (2) Insert cable in transmission case.
- (3) Attach cable to throttle cam (Fig. 92).
- (4) Install cable bracket on case and tighten attaching bolt to 10 N·m (7 ft. lbs.) torque (Fig. 93).
- (5) Install pan and tighten pan bolts to 7 N·m (65 in. lbs.) torque.

(6) Install new gasket on oil pan drain plug. Install and tighten plug to 20 N·m (15 ft. lbs.) torque.

(7) Connect cable to engine bracket and throttle linkage.

(8) Fill transmission with Mopar® Dexron/Mercon IIE.

(9) Adjust the cable as described in cable adjustment procedure.

OIL PUMP SEAL**REMOVAL**

- (1) Remove converter.
- (2) Remove old seal. Use blunt punch to collapse seal and pry seal out of pump housing. Do not scratch or damage seal bore.

INSTALLATION

- (1) Lubricate lip of new seal with transmission fluid and install seal in pump with tool 7549 (Fig. 94).

J8921-471

Fig. 94 Installing Oil Pump Seal

- 1 - PUMP SEALER INSTALLER

(2) Lubricate converter drive hub with transmission fluid.

(3) Align and install converter in oil pump.

DISASSEMBLY AND ASSEMBLY

TRANSMISSION

DISASSEMBLY

- (1) Remove torque converter.
- (2) Remove clamps attaching wire harness and throttle cable (Fig. 95) to transmission.

J8921-474

Fig. 95 Typical Harness And Cable Clamp Attachment

- 1 - CLAMP
- 2 - THROTTLE CABLE
- 3 - TRANSMISSION HARNESS

- (3) Remove shift lever from manual valve shaft at left side of transmission.
- (4) Remove park/neutral position switch.
- (5) Remove speed sensor.
- (6) Remove converter housing bolts and remove housing (Fig. 96) from case.
- (7) Remove adapter housing, speedometer drive gear, and speed sensor rotor.
- (8) Remove transmission oil pan, oil screen and screen gaskets (Fig. 97).

J8921-476

Fig. 96 Converter Housing Removal

- 1 - CONVERTER HOUSING

J8921-484

Fig. 108 Fourth Gear Planetary Race Removal

- 1 - PLANETARY (OVERDRIVE)
2 - RACE

(23) Remove thrust bearing, race and overdrive planetary ring gear (Fig. 109).

(24) Measure stroke length of overdrive brake piston as follows:

DISASSEMBLY AND ASSEMBLY (Continued)

J8921-485

Fig. 109 Removing Bearing, Race And Planetary Ring Gear

- 1 - THRUST BEARING
2 - RACE
3 - OVERDRIVE PLANETARY RING GEAR

(a) Mount dial indicator on case using Miller Tool C-3339 and a suitable bolt threaded into the transmission case.

(b) Verify that the dial indicator is mounted solidly and square to the direction of the piston travel.

(c) Apply 57-114 psi air pressure through piston apply port and note piston stroke on dial indicator. Stroke length should be: 1.40 - 1.70 mm (0.055 - 0.0699 in.).

(d) Record the reading for use during re-assembly.

(e) Remove the dial indicator set-up from the transmission.

(25) Measure stroke length of second coast brake piston rod as follows:

(a) Install a small wire tie strap around the second coast brake piston rod tight against the transmission case.

(b) Apply 57-114 psi air pressure through piston feed hole and check stroke length with Gauge Tool 7552.

(c) Stroke length should be 1.5 - 3.0 mm (0.059 - 0.118 in.).

(d) Record the reading for use during re-assembly.

(26) Remove the bolt holding the input speed sensor to the transmission case.

(27) Remove the input speed sensor from the transmission case.

(28) Remove overdrive brake pack snap ring (Fig. 110).

J8921-487

Fig. 110 Removing Overdrive Brake Pack Snap Ring

- 1 - OVERDRIVE BRAKE SNAP RING

(29) Remove overdrive brake pack discs and plates. Inspect and replace as necessary.

(30) Remove overdrive support lower race and upper bearing and race assembly (Fig. 111).

J8921-489

Fig. 111 Overdrive Support Bearing/Race Removal

Fig. 126 Removing/Measuring Second Brake Clutch Disc Thickness

DISASSEMBLY AND ASSEMBLY (Continued)

(49) Remove bolts attaching park rod bracket to case. Then disconnect park rod from manual shaft lever and remove rod and bracket (Fig. 127).

J8921-507

Fig. 127 Removing Park Rod And Bracket

- 1 - PARK ROD BRACKET
- 2 - SHIFT SETOR

(50) Remove park pawl spring, pin and pawl (Fig. 128).

(51) Measure clearance of first-reverse brake clutch pack (Fig. 129). Clearance should be: 0.70 - 1.2 mm (0.028 - 0.047 in.). record measurement for use during re-assembly.

(52) Remove second brake piston sleeve (Fig. 130).

(53) Remove second brake snap-ring.

(54) Remove rear planetary gear, second brake drum and output shaft as an assembly (Fig. 131).

(55) Remove planetary and brake drum thrust bearing and race assembly (Fig. 132).

(56) Remove second brake drum gasket from case with screwdriver.

(57) Measure inside diameter of transmission case rear bushing with bore gauge or inside micrometer (Fig. 133). Maximum allowable diameter is 38.18 mm (1.5031 in.). **Replace transmission case if bushing I. D. is greater than specified. Bushing is not serviceable.**

ASSEMBLY

(1) During assembly, lubricate components with transmission fluid or petroleum jelly as indicated.

(2) Verify thrust bearing and race installation during assembly. Refer to the Thrust Bearing Chart (Fig.

DISASSEMBLY AND ASSEMBLY (Continued)

J8921-669

Fig. 138 Thrust Bearing Chart

138) for bearing and race location and correct positioning.

(3) Install new seals onto the No.1 first-reverse brake piston. Lubricate seals with transmission fluid.

(4) Install the No.1 first-reverse brake piston into the transmission case.

(5) Install new seal onto the first-reverse brake piston reaction sleeve. Lubricate seals with transmission fluid.

(6) Install the first-reverse brake piston reaction sleeve into the transmission case.

(7) Install new seal onto the No.2 first-reverse brake piston. Lubricate seals with transmission fluid.

(8) Install the No.2 first-reverse brake piston into the transmission case.

(9) Install the spring plate into the No.2 first-reverse brake piston.

(10) Install Spring Compressor 7539 onto the first-reverse brake piston.

(11) Compress the first-reverse brake piston spring and install the first-reverse brake piston snap-ring.

(12) Remove Spring Compressor 7539.

(13) Install rear planetary gear, second brake drum and output shaft as outlined in following steps:

(14) Verify No. 10 thrust bearing and race (Fig. 138). Bearing and race outer diameter is 57.7 mm (2.272 in.) and inside diameter is 39.2 mm (1.543 in.).

(15) Coat thrust bearing and race assembly with petroleum jelly and install in case (Fig. 139). Race faces down. Bearing rollers face up.

(16) Align teeth of second brake drum and clutch pack (Fig. 140).

DISASSEMBLY AND ASSEMBLY (Continued)

DISASSEMBLY AND ASSEMBLY (Continued)

(35) Install planetary snap ring on sun gear with snap ring plier tool 7541 (Fig. 155).

J8921-687

Fig. 155 Installing Front Planetary Snap Ring

- 1 - SNAP RING PLIER TOOL
2 - FRONT PLANETARY
3 - SNAP RING

(36) Install tabbed thrust race on front planetary gear. Washer tabs face down and toward gear. Race outer diameter is 47.8 mm (1.882 in.). Inside diameter is 34.3 mm (1.350 in.).

(37) Install second coast brake band (Fig. 156).

J8921-689

Fig. 156 Installing Second Coast Brake Band

- 1 - SECOND COAST BRAKE BAND

(38) Install pin in second coast brake band. Then install retaining ring on pin (Fig. 157).

J8921-690

Fig. 157 Installing Second Coast Brake Band Retaining Pin

- 1 - SECOND COAST BRAKE BAND
2 - BAND RETAINING PIN
3 - RETAINING RING (INSTALL ON PIN)

(39) Install thrust bearing and race in forward-direct clutch (Fig. 158). Coat bearing/race with petroleum jelly to hold them in place.

(40) Verify forward-direct clutch thrust bearing size.

- Race outer diameter is 48.9 mm (1.925 in.) and inside diameter is 26.0 mm (1.024 in.).

- Bearing outer diameter is 46.7 mm (1.839 in.) and inside diameter is 26.0 mm (1.024 in.).

(41) Coat front planetary ring gear race with petroleum jelly and install it in ring gear (Fig. 159).

DISASSEMBLY AND ASSEMBLY (Continued)

J8921-691

Fig. 158 Installing Forward-Direct Clutch Thrust Bearing And Race

- 1 - THRUST BEARING
2 - RACE
3 - FORWARD-DIRECT CLUTCH ASSEMBLY

(42) Verify ring gear race size. Outer diameter is 47.0 mm (1.850 in.) and inside diameter is 26.5 mm (1.045 in.).

J8921-692

Fig. 159 Installing Planetary Ring Gear Race

- 1 - PLANETARY RING GEAR
2 - THRUST RACE

(43) Align forward-direct clutch disc splines with screwdriver (Fig. 160).

(44) Align and install front planetary ring gear in forward-direct clutch (Fig. 161).

(45) Coat bearing and race with petroleum jelly and install them in ring gear (Fig. 162). Verify bearing/race size.

- Bearing outer diameter is 47.7 mm (1.878 in.) and inside diameter is 32.6 mm (1.283 in.).

- Race outer diameter is 53.6 mm (2.110 in.) and inside diameter is 30.6 mm (1.205 in.).

(46) Install assembled planetary gear/forward-direct clutch (Fig. 163).

J8921-693

- 5 - SPRING AND RETAINER
- 6 - PISTON ROD

(50) Install assembled second coast brake piston in case. Verify that the piston rod contacts the second coast brake band.

(51) Install replacement seals on second coast brake piston cover and install cover in case.

(52) Install second coast brake piston snap ring with snap ring plier tool (Fig. 166).

(53) Check second coast brake piston stroke as follows:

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 166 Installing Second Coast Brake Piston Snap Ring

- 1 - PISTON SNAP RING
2 - SNAP RING TOOL

Fig. 167 Marking Brake Piston Rod

- 1 - BRAKE PISTON ROD
2 - REFERENCE MARK
3 - PISTON FEED HOLE

(a) Install a small wire tie strap around the second coast brake piston rod tight against the transmission case.

(b) Apply 57–114 psi air pressure through piston feed hole and check stroke length with Gauge Tool 7552.

(c) Stroke length should be 1.5 – 3.0 mm (0.059 – 0.118 in.).

(d) If stroke length is incorrect, piston, cover or snap ring is not seated. Reassemble and check stroke again if necessary.

(54) Coat thrust race and tabbed washer with petroleum jelly and install them on overdrive support (Fig. 169). Verify race size. Race outer diameter is 50.9 mm (2.004 in.) and inside diameter is 36.2 mm (1.426 in.).

J8921-702

Fig. 168 Checking Second Coast Brake Piston Stroke

- 1 - PISTON ROD REFERENCE MARK
2 - GAUGE TOOL
3 - AIR GUN
4 - GAUGE TOOL

(55) Install overdrive support in case. Use two long bolts to help align and guide support into position (Fig. 170).

(56) Install overdrive support snap ring with Snap Ring Plier Tool 7540 (Fig. 171). Chamfered side of snap ring faces up and toward case front. **Snap ring ends must be aligned with case opening with ring ends approximately 24 mm (0.94 in.) from center line of case opening.**

(57) Install and tighten overdrive support bolts to 25 N·m (19 ft. lbs.) torque (Fig. 172).

DISASSEMBLY AND ASSEMBLY (Continued)

(58) Check output shaft end play with dial indicator (Fig. 173). End play should be 0.27 – 0.86 mm (0.0106 – 0.0339 in.).

(59) If output shaft end play is incorrect, one or more of installed components is not seated. Reassemble as necessary and check end play again.

Fig. 173 Checking Output Shaft End Play

- 1 – DIAL INDICATOR
2 – OUTPUT SHAFT

(60) Install overdrive brake clutch pack (Fig. 174). Install thickest clutch plate first. Rounded edge of plate faces up. Install first disc followed by another plate until four discs and three plates are installed.

J8921-708

Fig. 174 Installing Overdrive Brake Clutch Pack

(61) Install stepped ring retainer plate with flat side facing disc. Then install brake pack snap ring (Fig. 175).

(62) Check overdrive brake piston stroke as follows:

(a) Mount dial indicator on case using Miller Tool C-3339 and a suitable bolt threaded into the transmission case.

(b) Verify that the dial indicator is mounted solidly and square to the direction of the piston travel.

Fig. 175 Installing Overdrive Brake Snap Ring

- 1 – CLUTCH PACK SNAP RING

(c) Apply 57–114 psi air pressure through piston apply port and note piston stroke on dial indicator. Stroke length should be: 1.40 – 1.70 mm (0.055 – 0.0699 in.).

(d) If stroke is incorrect, brake pack or piston is installed incorrectly. Check and correct as necessary and measure piston stroke again.

(e) Remove the dial indicator set-up from the transmission.

(63) Coat overdrive lower race, thrust bearing and upper race with petroleum jelly and install them in overdrive support (Fig. 176). Be sure races and bearing are assembled and installed as shown.

(64) Verify bearing/race sizes before proceeding. Bearing race sizes are:

- Outer diameter of lower race is 47.8 mm (1.882 in.) and inside diameter is 34.3 mm (1.350 in.).
- Outer diameter of bearing is 47.7 mm (1.878 in.) and inside diameter is 32.7 mm (1.287 in.).
- Outer diameter of upper race is 47.8 mm (1.882 in.) and inside diameter is 30.7 mm (1.209 in.).

(65) Install overdrive planetary ring gear in support (Fig. 177).

(66) Coat ring gear thrust race and thrust bearing assembly with petroleum jelly and install them in gear (Fig. 178).

(67) Verify bearing/race size before proceeding.

- Outer diameter of ring gear race-bearing is 47.8 mm (1.882 in.) and inside diameter is 24.2 mm (0.953 in.).

flanged tube ends and straight tube ends are installed as shown.

(89) Install new gaskets on oil screen and install screen on valve body. Tighten screen bolts to 10 N·m (7 ft. lbs.) torque.

(90) Install magnet in oil pan. Be sure magnet does not interfere with valve body oil tubes.

J8921-443

Fig. 190 Installing Valve Body Oil Tubes

(91) Apply Threebond® Liquid Gasket TB1281, P/N 83504038, to sealing surface of oil pan. Sealer bead should be at least 3 mm (1/8 in.) wide. Install pan on case and tighten pan bolts to 7 N·m (65 in. lbs.) torque.

(92) Install transmission speed sensor rotor and key on output shaft (Fig. 191).

(93) Install spacer and speedometer drive gear on output shaft. Then install retaining snap ring (Fig. 192).

(94) Apply bead of Threebond® Liquid Gasket TB1281, P/N 83504038, to sealing surface at rear of case (Fig. 193).

(95) Install adapter housing on transmission. Tighten adapter bolts to 34 N·m (25 ft. lbs.) torque.

(96) Install transmission speed sensor (Fig. 194). Tighten sensor bolt to 7.4 N·m (65 in. lbs.) torque and connect sensor wire harness connector.

(97) Install converter housing (Fig. 195). Tighten 12 mm diameter housing bolts to 57 N·m (42 ft. lbs.) torque. Tighten 10 mm diameter housing bolts to 34 N·m (25 ft. lbs.) torque.

(98) Install transmission shift lever on manual valve shaft. Do not install lever attaching nut at this time.

(99) Move transmission shift lever fully rearward. Then move lever two detent positions forward.

(100) Mount park/neutral position switch on manual valve shaft and tighten switch adjusting bolt just enough to keep switch from moving (Fig. 196).

(101) Install park/neutral position switch tabbed washer and retaining nut (Fig. 196). Tighten nut to

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 195 Installing Converter Housing**

- 1 - CONVERTER HOUSING
- 2 - HOUSING BOLTS

6.9 N·m (61 in. lbs.) torque, but do not bend any of the washer tabs against the nut at this time.

(102) Align park/neutral position switch standard line with groove or flat on manual shaft (Fig. 196).

(103) Tighten park/neutral position switch adjusting bolt to 13 N·m (9 ft. lbs.) torque.

(104) Install transmission shift lever on manual valve shaft. Tighten lever attaching nut to 16 N·m (12 ft. lbs.) torque.

(105) Install retaining clamp for wire harness and throttle cable (Fig. 197).

(106) Install torque converter.

(107) Verify that converter is seated by measuring distance between converter housing flange and one of the converter mounting pads (Fig. 198). Use straight-edge and vernier calipers to measure distance. On 6-cyl. transmissions, distance should be 16.5 mm (0.650 in.).

(108) Secure converter in transmission with C-clamp or metal strapping. Do this before mounting transmission on jack or moving transmission under vehicle.

(109) Install lower half of transmission fill tube (install upper half after transmission is in vehicle).

CAUTION: The transmission cooler and lines must be reverse flushed if overhaul corrected a malfunction that generated sludge, metal particles, or clutch friction material. The torque converter should also be replaced if contaminated by the same mal-

DISASSEMBLY AND ASSEMBLY (Continued)

ASSEMBLY

(1) Measure inside diameter of pump body bushing with bore gauge or inside micrometer (Fig. 200). Diameter should be maximum of 38.19 mm (1.5035 in.). Replace pump body if bushing I. D. is greater than specified.

(2) Measure inside diameter of stator shaft bushing (Fig. 200). Take measurements at front and rear of bushing. Diameter should be maximum of 21.58 mm (0.8496 in.) at front and 27.08 mm (1.0661 in.) at rear. Replace stator shaft if bushing diameter is greater than specified.

Fig. 200 Checking Pump/Stator Shaft Bushings

- 1 - BORE GAUGE
- 2 - PUMP BODY BUSHING
- 3 - BORE GAUGE
- 4 - STATOR SHAFT BUSHING

(3) Measure oil pump clearances (Fig. 201).

- Clearance between pump driven gear and pump body should be maximum of 0.3 mm (0.012 in.).
- Clearance between tips of pump gear teeth should be maximum of 0.3 mm (0.012 in.).
- Clearance between rear surface of pump housing and pump gears should be maximum of 0.1 mm (0.004 in.).

(4) Replace pump body and gears if any clearance is greater than specified.

2 - PLANETARY GEAR

(3) Measure stroke length of overdrive clutch piston as follows:

(a) Mount oil pump on torque converter. Then mount clutch on oil pump (Fig. 206).

J8921-525

Fig. 206 Assembling Converter, Pump And Clutch For Test

- 1 - OVERDRIVE CLUTCH
2 - OIL PUMP
3 - TORQUE CONVERTER

(b) Install a suitable threaded bolt/rod into oil pump for use in mounting Miller Tool C-3339 dial indicator components securely.

(c) Mount dial indicator on the bolt/rod and position the dial indicator squarely on the clutch piston.

(d) Apply compressed air through clutch feed hole in oil pump and note piston stroke length. Stroke length should be 1.85 - 2.15 mm (0.0728 - 0.0846 in.).

(4) Remove thrust bearing and race assembly from clutch drum (Fig. 207).

(5) Remove clutch pack snap ring and remove the clutch pack (Fig. 208).

(6) Measure overdrive clutch disc thickness. Minimum allowable thickness is 1.84 mm (0.0724 in.).

(7) If the clutch pack stroke length is out of specification or any clutch disc fails to meet the minimum thickness, new discs will need to be installed during assembly.

(8) Compress piston return spring with Tool 7538 (Fig. 209). Remove snap ring and remove compressor tool.

(9) Remove the piston return springs.

(10) Mount oil pump on converter. Then mount clutch on oil pump (Fig. 210).

(11) Hold clutch piston by hand and apply compressed air through oil pump feed hole to ease piston

(15) Install clutch on planetary gear.
 (16) Verify one-way clutch operation. Hold drum and turn planetary shaft clockwise and counterclockwise. Shaft should turn clockwise freely but lock when turned counterclockwise.

OVERDRIVE SUPPORT

DISASSEMBLY

- (1) Check brake piston operation. Mount support on clutch (Fig. 229).
- (2) Apply compressed air through support feed hole and observe brake piston movement (Fig. 229). Piston should move smoothly and not bind or stick. If operation is incorrect, replace piston and support.
- (3) Remove thrust bearing front race, thrust bearing and rear race (Fig. 230).
- (4) Turn overdrive support over and remove bearing race and clutch drum thrust washer (Fig. 231).
- (5) Compress piston return spring with Spring Compressor 7537 and remove piston snap ring (Fig. 232).

2 - OVERDRIVE SUPPORT
3 - THRUST WASHER

Fig. 232 Removing/Installing Piston Snap Ring

- 1 - COMPRESSOR TOOL
2 - SNAP RING

(6) Mount support in direct clutch and remove brake piston with compressed air. Apply air to same feed hole used when checking piston operation.

(7) Remove and discard support O-rings (Fig. 233).

(8) Remove support seal rings (Fig. 234).

(9) Measure free length of piston return springs with springs mounted in retainer (Fig. 235). Length should be 17.23 mm (0.678 in.).

(10) Clean support components and dry them with compressed air.

(11) Inspect overdrive support and brake piston. Replace support and piston if either part is worn or damaged.

ASSEMBLY

(1) Lubricate new support seal rings. Then compress rings and install them on support (Fig. 236).

(2) Lubricate and install new O-rings on brake piston. Then carefully seat piston in support.

(3) Install return springs on brake piston.

(4) Compress return springs with Spring Compressor 7537 (Fig. 232) and install piston snap ring.

(5) Install support bearing race and clutch drum thrust washer (Fig. 231).

(6) Install thrust bearing and front and rear bearing races. Thrust bearing rollers should face upward as shown (Fig. 236).

(7) Verify thrust bearing/race sizes (Fig. 237).

- Front race outer diameter is 47.8 mm (1.882 in.) and inside diameter is 30.7 mm (1.209 in.).

- Rear race outer diameter is 47.8 mm (1.882 in.) and inside diameter is 34.3 mm (1.350 in.).

- Bearing outer diameter is 47.7 mm (1.878 in.) and inside diameter is 32.7 mm (1.287 in.).

(8) Verify brake piston operation. Use same procedure described at beginning of disassembly. Piston should operate smoothly and not bind or stick.

3 - FRONT RACE

DIRECT CLUTCH**DISASSEMBLY**

- (1) Remove direct clutch from forward clutch (Fig. 238).

**Fig. 238 Separate Direct Clutch From Forward Clutch**

- 1 - DIRECT CLUTCH
2 - FORWARD CLUTCH

- (2) Remove clutch drum thrust washer (Fig. 239).

**Fig. 239 Removing Clutch Drum Thrust Washer**

- 1 - THRUST WASHER
2 - CLUTCH DRUM

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Check clutch piston stroke length as outlined in following steps.

(4) Mount direct clutch on overdrive support assembly (Fig. 240).

J8921-557

Fig. 240 Mount Direct Clutch On Overdrive Support

- 1 - DIRECT CLUTCH
2 - OVERDRIVE SUPPORT

(5) Mount dial indicator on clutch and position indicator plunger on clutch piston (Fig. 241).

(6) Apply 57-114 psi air pressure through feed hole in overdrive support and note piston stroke length (Fig. 241). Check stroke at least twice.

(7) Piston stroke length should be 1.37 mm - 1.67 mm (0.054 - 0.065 in.). If stroke length is incorrect, either the clutch pack retainer or clutch discs will have to be replaced.

(8) Remove clutch pack snap ring and remove retainer and clutch pack from drum (Fig. 242).

(9) Compress clutch piston return springs with tool 7538 and remove clutch piston snap ring (Fig. 243).

(10) Remove compressor tool and return spring.

(11) Remove clutch piston. Remount clutch on overdrive support (Fig. 244). Apply compressed air through piston feed hole in support to remove piston. Use only enough air to ease piston out.

(12) Remove and discard clutch piston O-rings.

(13) Measure clutch disc thickness. Minimum allowable thickness is 1.84 mm (0.0724 in). Replace clutch pack if any disc is below minimum thickness.

(14) Measure free length of piston return springs with springs in retainer (Fig. 245). Length should be 21.32 mm (0.839 in.). Replace return springs if not within specification.

J8921-558

- 7 - CLUTCH PACK SNAP RING
- 8 - RETAINER
- 9 - CLUTCH PACK
- 10 - CLUTCH DISC*
- 11 - CLUTCH PLATE*

ASSEMBLY

(1) Lubricate and install replacement O-rings on clutch piston (Fig. 247).

(2) Install clutch piston in drum and install return springs on piston.

(3) Compress piston return springs with Tool 7538 and install snap ring (Fig. 243). Be sure snap ring end gap is not aligned with spring retainer tab.

(4) Install clutch discs and plates (Fig. 248). Install plate then disc until all plates and discs are installed. Four plates and discs are required.

(5) Install clutch pack retainer in drum (Fig. 249).

(6) Install clutch pack snap ring (Fig. 249).

(7) Check snap ring position. If necessary, shift snap ring until end gap is **not** aligned with any notches in clutch drum (Fig. 250).

(8) Lubricate clutch drum thrust washer with petroleum jelly and install it in drum (Fig. 240).

(9) Mount direct clutch assembly on forward clutch assembly and check assembled height (Fig. 251). Height should be 70.3 to 71.5 mm (2.767 to 2.815 in.).

(10) If assembled height is incorrect, clutches are not seated.

FORWARD CLUTCH

DISASSEMBLY

J8921-567

Fig. 252 Forward Clutch Components

(1) Check clutch piston stroke as outlined in following steps.

(2) Position overdrive support on wood blocks and mount forward clutch drum on support (Fig. 253).

(3) Remove bearing and race from forward clutch drum (Fig. 253).

(4) Install a suitable threaded bolt/rod into the side of the overdrive support.

(5) Mount Miller Tool C-3339 dial indicator components onto the threaded rod as necessary.

(6) Position dial indicator plunger squarely against clutch piston.

DISASSEMBLY AND ASSEMBLY (Continued)

- 2 - BEARING RACE
- 3 - FORWARD CLUTCH DRUM
- 4 - OVERDRIVE SUPPORT
- 5 - WOOD BLOCKS

(7) Apply compressed air through right side feed hole in support and note piston stroke length on dial indicator.

(8) Stroke length should be 3.55 - 3.73 mm (0.1348 - 0.1469 in.).

(9) Replace clutch discs if stroke length is incorrect.

(10) Remove clutch pack snap ring and remove retainer and clutch pack (Fig. 254).

(11) Remove clutch pack cushion plate (Fig. 255).

(12) Compress clutch springs with Tool 7538 and remove piston snap ring.

(13) Remove spring compressor tool and piston return springs.

(14) Remount forward clutch drum on overdrive support (Fig. 256).

(15) Apply compressed air through feed hole in support to remove piston (Fig. 256). Use only enough air pressure to ease piston out of drum.

(16) Remove and discard clutch piston O-rings (Fig. 257).

(17) Remove clutch drum O-ring from rear hub of drum.

(18) Remove three seal rings from clutch drum shaft (Fig. 258).

(19) Remove thrust bearing and race assembly from clutch drum (Fig. 259).

DISASSEMBLY AND ASSEMBLY (Continued)

(20) Measure clutch disc thickness (Fig. 260). Minimum allowable thickness is 1.51 mm (0.0595 in.). Replace clutch pack if any disc falls below specified minimum thickness.

J8921-576

Fig. 260 Measuring Clutch Disc Thickness

- 1 - CLUTCH DISC
2 - MICROMETER

(21) Measure free length of piston return springs with springs mounted in retainer (Fig. 261). Length should be 19.47 mm (0.767 in.). Replace springs and retainer if length is incorrect.

(22) Inspect clutch piston check ball (Fig. 262). Ball should move freely within piston. Check ball seating by applying low pressure compressed air to ball feed hole. Ball should seat firmly and not leak air.

(23) Measure inside diameter of bushing in clutch drum hub. Maximum allowable diameter is 24.08 mm (0.9480 in.). Replace clutch drum if bushing inside diameter is greater than specified.

ASSEMBLY

(1) Lubricate bearing and race assembly with petroleum jelly and install it in clutch drum (Fig. 263). Race side of assembly faces downward and toward drum. Bearing rollers face up (Fig. 263)

(2) Coat new clutch drum shaft seal rings with petroleum jelly. Before installing drum shaft seal rings, squeeze each ring so ring ends overlap (Fig. 264). This tightens ring making clutch installation easier.

J8921-536

- 1 - PISTON RETURN SPRINGS
2 - SPRING RETAINER

J8921-577

Fig. 262 Testing Piston Check Ball

- 1 - PISTON CHECK BALL
2 - USE LOW AIR PRESSURE FOR TEST

(3) Install seal rings on shaft. Keep rings closed as tightly as possible during installation. Avoid over-spreading them.

(4) Mount clutch drum on overdrive support.

(5) Lubricate and install new O-ring on clutch drum hub (Fig. 257).

DISASSEMBLY AND ASSEMBLY (Continued)

2 - THRUST BEARING AND RACE
3 - FORWARD CLUTCH

Fig. 264 Installing Clutch Drum Shaft Seal Rings

- 1 - SEAL RINGS (COMPRESS BEFORE INSTALLATION)
2 - CLUTCH DRUM SHAFT

(6) Lubricate new clutch piston O-rings with Mopar Door Ease, or Ru-Glyde. Install rings on clutch piston and install piston in drum.

(7) Install piston return springs.

(8) Compress piston return springs with Tool 7538 and shop press and install piston snap ring. Be sure snap ring end gap is not aligned with any notches in drum.

(9) Install cushion plate in drum. Concave side of plate faces downward (Fig. 255).

(10) Install clutch discs, plates and retainer (Fig. 265). Install tabbed plate followed by disc until required number of plates and discs are installed. Use six plates and discs.

Fig. 265 Installing Forward Clutch Discs And Plates

- 1 - RETAINER
2 - CLUTCH PLATES
3 - CLUTCH DISCS

(11) Install clutch pack snap ring.

(12) Recheck clutch piston stroke length using same method outlined at beginning of disassembly procedure. If stroke length is not within specified limits, replace clutch discs.

(13) Lubricate race and bearing with petroleum jelly and install them in clutch drum (Fig. 266). Be sure bearing rollers face up and race lip seats in drum as shown.

(14) Verify bearing and race size.

- Outer diameter of bearing is 46.7 mm (1.839 in.).
- Outer diameter of race is 48.9 mm (1.925 in.).
- Inner diameter of bearing and race is 26.0 mm (1.024 in.).

(15) Mount forward clutch on direct clutch and check assembled height (Fig. 267). Height should be 70.3 - 71.5 mm (2.767 - 2.815 in.).

FRONT PLANETARY GEAR

DISASSEMBLY

- (1) Remove ring gear from planetary gear (Fig. 268).
(2) Remove front bearing and the two races from ring gear (Fig. 268).

- (3) Remove tabbed thrust race from planetary gear (Fig. 268).

- (4) Remove snap ring attaching planetary gear to shaft and remove gear.

9 - FRONT RACE

DISASSEMBLY AND ASSEMBLY (Continued)

- (5) Remove rear bearing and race from planetary gear.
- (6) Measure inside diameter of ring gear bushing. Maximum allowable diameter is 24.08 mm (0.9480 in.). Replace ring gear if bushing inside diameter is greater than specified.
- (7) Check condition of planetary gear. Replace gear if teeth are worn, pins are loose, or carrier is cracked, distorted, or worn.

ASSEMBLY

- (1) Lubricate planetary and ring gear bearings and races with petroleum jelly.
- (2) Identify planetary bearings and races before installation. (Fig. 268). Bearings and races can be identified by following dimensions:
 - Outer diameter of rear bearing is 47.7 mm (1.878 in.). Inner diameter is 35.5 mm (1.398 in.).
 - Outer diameter of rear race 47.6 mm (1.874 in.). Inner diameter is 33.7 mm (1.327 in.).
 - Outer diameter of front race is 53.6 mm (2.110 in.). Inner diameter is 30.5 mm (1.201 in.).
 - Outer diameter of front bearing is 47.7 mm (1.878 in.). Inner diameter is 32.6 (1.283 in.).
 - Outer diameter of forward race is 47.0 mm (1.850 in.). Inner diameter is 26.5 mm 1.043 in.).
- (3) Install rear race and bearing in gear (Fig. 269).
- (4) Turn planetary over and install thrust race (Fig. 270).
- (5) Install front race and bearing and forward race in ring gear (Fig. 271).

- 8 - SECOND BRAKE PISTON
- 9 - PISTON SLEEVE

DISASSEMBLY AND ASSEMBLY (Continued)

(6) Check one-way clutch operation again (Fig. 272). Hold sun gear and turn second brake hub clockwise and counterclockwise. Hub should turn clockwise freely, but lock when turned counterclockwise.

SECOND BRAKE**DISASSEMBLY**

(1) Remove second brake drum from output shaft (Fig. 280).

J8921-597

Fig. 280 Removing/Installing Second Brake Assembly

- 1 - SECOND BRAKE ASSEMBLY
2 - OUTPUT SHAFT

(2) Remove thrust washer from second brake drum (Fig. 281).

(3) Compress piston return springs with shop press and tool 7538. Then remove piston snap ring (Fig. 282).

(4) Remove compressor tool and remove spring retainer and return springs.

(5) Remove second brake piston and sleeve from drum with compressed air (Fig. 283). Use only enough air pressure to ease piston out of drum.

(6) Remove and discard brake piston O-rings.

(7) Measure free length of piston return springs with springs mounted in retainer (Fig. 284). Length should be approximately 16.05 mm (0.632 in.). Replace return springs if length is less than specified.

J8921-598

J8921-613

Fig. 296 Removing/Installing Ring Gear Hub

- 1 - SNAP RING
2 - RING GEAR
3 - HUB

(13) Inspect and replace any worn or damaged planetary gear components.

ASSEMBLY

(1) Measure thickness of each brake pack disc. Minimum thickness is 1.51 mm (0.0594 in.). Replace all discs if any disc is thinner than specified.

(2) Install hub and snap ring in ring gear (Fig. 296)

(3) Identify ring gear thrust bearing and races by following dimensions (Fig. 295) :

- Outer diameter of bottom race is 44.8 mm (1.764 in.) and inner diameter is 27.6 mm (1.087 in.).
- Outer diameter of bearing is 44.7 mm (1.760 in.) and inner diameter is 30.1 mm (1.185 in.).
- Outer diameter of upper race is 44.8 mm (1.764 in.) and inner diameter is 28.8 mm (1.134 in.).

(4) Lubricate ring gear thrust bearing and races with petroleum jelly and install them in ring gear (Fig. 295).

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Coat planetary thrust washers with petroleum jelly and install them in gear (Fig. 294).

(6) Install No. 2 one-way clutch bottom end cap into the planetary gear.

(7) Install No. 2 one-way clutch in planetary gear. Be sure flanged side of clutch faces upward (Fig. 297).

(8) Install No. 2 one-way clutch top end cap into the planetary gear.

(9) Install clutch retaining snap ring and install clutch inner race (Fig. 292). Turn race counterclockwise to ease installation.

(10) Verify one-way clutch operation. Hold gear and turn inner race in both directions. Race should turn freely counterclockwise, but lock when turned clockwise.

(11) Install planetary gear in ring gear.

(12) Install thrust bearing and washers onto the ring gear (Fig. 295).

(13) Assemble clutch discs and clutch plates (Fig. 289). Sequence is disc first, then a plate. Use seven discs and plates.

(14) Install brake pack on planetary gear (Fig. 289).

(15) Install new seal ring on output shaft (Fig. 288). Be sure ring ends are interlocked as shown.

CLEANING AND INSPECTION

TRANSMISSION PARTS CLEANING AND INSPECTION

Clean the transmission components with solvent and dry them with compressed air only. Do not use shop towels or rags.

Blow compressed air through all oil feed passages and channels to be sure they are clear. Inspect the transmission components for wear and damage. Replace components that are damaged or worn beyond the limits specified in the individual overhaul procedures.

Replace all O-rings, gaskets and seals. These components are not reusable. Also replace any snap ring that is distorted or damaged.

During overhaul assembly operations, lubricate the transmission components with Mopar MerconTM automatic transmission fluid or petroleum jelly as indicated. Petroleum jelly should be used to prelubricate thrust bearings, washers and races. It can also be used to hold parts in position during assembly.

Soak replacement clutch and brake pack components in transmission fluid for at least 30 minutes before installation.

ADJUSTMENTS

GEARSHIFT CABLE

Check adjustment by starting the engine in Park and Neutral. Adjustment is OK if the engine starts only in these positions. Adjustment is incorrect if the engine starts in one but not both positions. If the engine starts in any position other than Park or Neutral, or if the engine will not start at all, the park/neutral position switch may be faulty.

Gearshift Adjustment Procedure

- (1) Shift transmission into Park.
- (2) Raise vehicle.
- (3) Release cable adjuster clamp (at transmission end of cable) to unlock cable.
- (4) Unsnap cable from cable mounting bracket on transmission (Fig. 300).
- (5) Slide cable eyelet off transmission shift lever.
- (6) Verify transmission shift lever is in Park detent by moving lever fully rearward. Last rearward detent is Park position.
- (7) Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
- (8) Slide cable eyelet onto transmission shift lever.
- (9) Snap shift cable adjuster into mounting bracket on transmission.

(10) Lock shift cable by pressing cable adjuster clamp down until it snaps into place.

(11) Lower vehicle and check engine starting. Engine should start only in Park and Neutral.

J9321-417

- 1 - THROTTLE VALVE CABLE
- 2 - TRANSMISSION SHIFT LEVER
- 3 - SHIFT CABLE
- 4 - SHIFT CABLE BRACKET

BRAKE TRANSMISSION SHIFT INTERLOCK CABLE ADJUSTMENT

- (1) Shift transmission into PARK.
- (2) Remove shift lever bezel and console screws. Raise bezel and console for access to cable.
- (3) Pull cable lock button up to release cable (Fig. 301).
- (4) Turn ignition switch to LOCK position.
- (5) Use a spacer to create a one millimeter gap between the shifter pawl and top of the shift gate.
- (6) Pull cable forward. Then release cable and press cable lock button down until it snaps in place.
- (7) Check adjustment as follows:
 - (a) Check movement of release shift handle button (floor shift) or release lever (column shift). You should not be able to press button inward or move column lever.
 - (b) Turn ignition switch to RUN position.
 - (c) Shifting out of park should not be possible.
 - (d) Apply the brake and attempt to shift out of PARK. Shifting should be possible.
 - (e) While the transmission is shifted out of PARK, release the brake and attempt to shift

- 4 - CABLE

through all gears. Release the shift button at least once during this procedure. The ignition key should not go to the LOCK position.

(f) Return transmission to the PARK position without applying the brake.

(8) Move shift lever back to PARK and check ignition switch operation. You should be able to turn switch to LOCK position and shift lever release button/lever should not move.

TRANSMISSION THROTTLE VALVE CABLE ADJUSTMENT

(1) Shift transmission into Park, shut engine off and raise hood.

(2) Press cable release button (Fig. 302).

(3) Push cable conduit back into cable sheath as far as possible (Fig. 303).

(4) Rotate lever on throttle body to wide open throttle position. Cable will ratchet to correct adjustment point as lever is rotated (Fig. 303).

DESCRIPTION AND OPERATION

NV231 TRANSFER CASE

DESCRIPTION

The NV231 is a part-time transfer case with a low range reduction gear system. The NV231 has three operating ranges plus a Neutral position. A low range system provides a reduction ratio for increased low speed torque capability.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum retainer housings bolted to the case halves.

OPERATING RANGES

Transfer case operating ranges are:

- 2WD (2-wheel drive)
- 4x4 (4-wheel drive)
- 4 Lo (4-wheel drive low range)

The 2WD range is for use on any road surface at any time.

The 4x4 and 4 Lo ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is wet or slippery or covered by ice and snow.

The low range reduction gear system is operative in 4 Lo range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

SHIFT MECHANISM

Operating ranges are selected with a floor mounted shift lever. The shift lever is connected to the transfer case range lever by an adjustable linkage rod. A straight line shift pattern is used. Range positions are marked on the shifter bezel cover plate.

IDENTIFICATION

A circular ID tag is attached to the rear case of each transfer case (Fig. 1). The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

Fig. 1 Fill/Drain Plug And I. D. Tag Locations

- 1 - I. D. TAG
2 - FILL PLUG
3 - DRAIN PLUG

OPERATION

The input gear is splined to the transmission output shaft. The input gear drives the mainshaft through the planetary assembly and range hub. The front output shaft is operated by a drive chain that connects the shaft to a drive sprocket on the mainshaft. The drive sprocket is engaged/disengaged by the mode fork, which operates the mode sleeve and

DESCRIPTION AND OPERATION (Continued)

hub. The sleeve and hub are not equipped with a synchronizer mechanism for shifting.

LUBRICANT AND FILL LEVEL

DESCRIPTION

Recommended lubricant for the NV231 transfer case is Mopar® Dexron II, or ATF Plus 3, type 7176. Approximate lubricant fill capacity is 1.2 liters (2.5 pints).

The fill and drain plugs are both in the rear case (Fig. 2). Correct fill level is to the bottom edge of the fill plug hole. Be sure the vehicle is level to ensure an accurate fluid level check.

80b09a60

- 3 – DRAIN PLUG

DIAGNOSIS AND TESTING

NV231 DIAGNOSIS

DIAGNOSIS CHART

Condition	Possible Cause	Correction
Transfer case difficult to shift or will not shift into desired range.	1) Vehicle speed too great to permit shifting.	1) Slow vehicle and shift into desired range.
	2) If vehicle was operated for an extended period in 4H mode on dry surface, driveline torque load may cause difficulty.	2) Stop vehicle and shift transfer case to Neutral position. Transfer case can then be shifted to the desired mode.
	3) Transfer case shift linkage binding.	3) Repair or replace linkage as necessary.
	4) Insufficient or incorrect lubricant.	4) Drain and refill transfer case with the correct type and quantity of lubricant.
	5) Internal transfer case components binding, worn, or damaged.	5) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct type and quantity of lubricant.

DIAGNOSIS AND TESTING (Continued)

Condition	Possible Cause	Correction
Transfer case noisy while in, or jumps out of, 4L mode.	1) Transfer case not completely engaged in 4L position.	1) Slow vehicle, shift transfer case to the Neutral position, and then shift into the 4L mode.
	2) Transfer case shift linkage out of adjustment.	2) Adjust linkage as necessary.
	3) Transfer case shift linkage loose or binding.	3) Repair, replace, or tighten linkage components as necessary.
	4) Range fork damaged, inserts worn, or fork is binding on the shift rail.	4) Repair or replace components as necessary.
	5) Low range gear worn or damaged.	5) Repair or replace components as necessary.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.
Abnormal tire wear.	1) Extended operation in 4H mode on dry surfaces,	1) Operate vehicle in 2H mode on dry surfaces.

REMOVAL AND INSTALLATION

TRANSFER CASE

REMOVAL

- (1) Shift transfer case into Neutral.
- (2) Raise vehicle.
- (3) Drain transfer case lubricant.
- (4) Mark front and rear propeller shaft yokes for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove rear crossmember, or skid plate.
- (7) Disconnect front/rear propeller shafts at transfer case.
- (8) Disconnect vehicle speed sensor wires.
- (9) Disconnect transfer case linkage rod from range lever.
- (10) Disconnect transfer case vent hose (Fig. 3) and indicator switch harness, if necessary.
- (11) Support transfer case with transmission jack.
- (12) Secure transfer case to jack with chains.
- (13) Remove nuts attaching transfer case to transmission.
- (14) Pull transfer case and jack rearward to disengage transfer case.
- (15) Remove transfer case from under vehicle.

INSTALLATION

- (1) Mount transfer case on a transmission jack.
- (2) Secure transfer case to jack with chains.

80b09a89

Fig. 3 Transfer Case Mounting

- 1 - VENT TUBE
- 2 - TRANSFER CASE
- 3 - TRANSMISSION

- (3) Position transfer case under vehicle.
- (4) Align transfer case and transmission shafts and install transfer case on transmission.
- (5) Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque (Fig. 3).
- (6) Connect vehicle speed sensor wires, and vent hose.
- (7) Connect indicator switch harness to transfer case switch, if necessary. Secure wire harness to clips on transfer case.

REMOVAL AND INSTALLATION (Continued)

(8) Align and connect propeller shafts. Refer to Group 3, Differential and Driveline, for proper procedures and specifications.

(9) Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.

(10) Install rear crossmember, or skid plate. Tighten crossmember bolts to 41 N·m (30 ft. lbs.) torque.

(11) Remove transmission jack and support stand.

(12) Connect shift rod to transfer case range lever.

(13) Adjust transfer case shift linkage.

(14) Lower vehicle and verify transfer case shift operation.

SHIFT LEVER

REMOVAL

(1) Shift transfer case into 4L.

(2) Raise vehicle.

(3) Loosen adjusting trunnion locknut and slide shift rod out of trunnion (Fig. 4). If rod lacks enough

travel to come out of trunnion, push trunnion out of torque shaft.

(4) Lower vehicle.

(5) Remove console. Refer to Group 23, Body, for proper procedures.

(6) Remove screws attaching lever assembly to floorpan and remove assembly and shift rod (if left attached).

INSTALLATION

(1) If shift rod was not removed from lever assembly, work rod down through floorpan opening. Then position lever assembly on floorpan and install assembly attaching screws.

(2) Install console. Refer to Group 23, Body, for proper procedures.

(3) Raise vehicle.

(4) Connect trunnion to torque shaft arm. Or, slide shift rod into trunnion on range lever. Be sure shift rod slides freely in trunnion.

(5) Verify that range lever is in 4L position. Then tighten trunnion lock bolt.

REMOVAL AND INSTALLATION (Continued)

(6) Lower vehicle and check transfer case shift operation.

SPEEDOMETER

REMOVAL

- (1) Raise vehicle.
- (2) Disconnect wires from vehicle speed sensor.
- (3) Remove adapter clamp and screw (Fig. 5).
- (4) Remove speed sensor and speedometer adapter as an assembly.
- (5) Remove speed sensor retaining screw and remove sensor from adapter.
- (6) Remove speedometer pinion from adapter. Replace pinion if chipped, cracked, or worn.
- (7) Inspect sensor and adapter O-rings (Fig. 5). Remove and discard O-rings if worn or damaged.
- (8) Inspect terminal pins in speed sensor. Clean pins with Mopar® electrical spray cleaner if dirty or oxidized. Replace sensor if faulty, or if pins are loose, severely corroded, or damaged.

INSTALLATION AND INDEXING

- (1) Thoroughly clean adapter flange and adapter mounting surface in housing. Surfaces must be clean for proper adapter alignment and speedometer operation.
- (2) Install new O-rings on speed sensor and speedometer adapter (Fig. 5), if necessary.

(3) Lubricate sensor and adapter O-rings with transmission fluid.

(4) Install vehicle speed sensor in speedometer adapter. Tighten sensor attaching screw to 2-3 N·m (15-27 in. lbs.) torque.

(5) Install speedometer pinion in adapter.

(6) Count number of teeth on speedometer pinion. Do this before installing assembly in housing. Then lubricate pinion teeth with transmission fluid.

(7) Note index numbers on adapter body (Fig. 6). These numbers will correspond to number of teeth on pinion.

(8) Install speedometer assembly in housing.

(9) Rotate adapter until required range numbers are at 6 o'clock position. Be sure range index numbers correspond to number of teeth on pinion gear.

(10) Install speedometer adapter clamp and retaining screw. Tighten clamp screw to 10-12 N·m (90-110 in. lbs.) torque.

(11) Connect wires to vehicle speed sensor.

(12) Lower vehicle and top off transmission fluid level if necessary.

FRONT OUTPUT SHAFT SEAL

REMOVAL

- (1) Raise vehicle.
- (2) Remove front propeller shaft. Refer to Group 3, Differential and Driveline, for proper procedure.

Fig. 7 Remove Front Output Shaft Seal

- 1 - OUTPUT SHAFT SEAL
2 - PRYBAR

INSTALLATION

- (1) Install new front output seal in front case with Installer Tool 8143 as follows:
- Place new seal on tool. Garter spring on seal goes toward interior of case.
 - Start seal in bore with light taps from hammer (Fig. 8). Once seal is started, continue tapping seal into bore until installer tool seats against case.

DISASSEMBLY AND ASSEMBLY**NV231 TRANSFER CASE****DISASSEMBLY**

Position transfer case on shallow drain pan. Remove drain plug and drain lubricant remaining in case.

REAR RETAINER AND OIL PUMP REMOVAL

- Remove the speedometer adapter.
- Spread band clamp which holds output shaft boot to slinger with a suitable awl, or equivalent.
- Remove output shaft boot from slinger and output shaft.
- Using Puller MD-998056-A, remove rear slinger (Fig. 9).
- Use a suitable pry tool, or a slide hammer mounted screw, to remove the seal from the rear retainer (Fig. 10).
- Remove the rear output bearing I. D. retaining ring (Fig. 11).
- Remove the bolts holding the rear retainer to the rear case half.
- Tap rear retainer with rawhide or rubber mallet to loosen sealer bead.

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 12 Rear Retainer Removal**

- 1 - MAINSHAFT
 2 - REAR RETAINER

(9) Remove rear retainer from rear case half (Fig. 12).

(10) Remove snap-ring holding oil pump in position on output shaft.

(11) Disengage oil pickup tube from oil pump and remove oil pump assembly. Remove oil pump by tilting the edge of the oil pump from under the edge of the rear case half and sliding the pump (Fig. 13).

(12) Remove pick-up tube o-ring from oil pump (Fig. 14), if necessary. Do not disassemble the oil pump, it is not serviceable.

**Fig. 13 Oil Pump Removal**

- 1 - OIL PUMP

Fig. 16 Yoke Removal

- 1 - PULLER TOOL
2 - YOKE

YOKE AND RANGE LEVER REMOVAL

- (1) Remove transfer case indicator switch.
- (2) Remove front yoke nut as follows:
 - (a) Move range lever to 4L position.
 - (b) Then remove nut with socket and impact wrench (Fig. 15).
- (3) Remove yoke. If yoke is difficult to remove by hand, remove it with bearing splitter, or with standard two jaw puller (Fig. 16). Be sure puller tool is positioned on yoke and not on slinger as slinger will be damaged.

800010957

Fig. 15 Yoke Nut Removal

- 1 - IMPACT WRENCH
2 - SOCKET
3 - YOKE

- (4) Remove seal washer from front output shaft. Discard washer as it should not be reused.

- (5) Remove nut and washer that attach range lever to sector shaft. Then move sector to neutral position and remove range lever from shaft (Fig. 17).

80010943

Fig. 17 Range Lever Removal

- 1 - RANGE LEVER
2 - SECTOR SHAFT

DISASSEMBLY AND ASSEMBLY (Continued)

FRONT OUTPUT SHAFT AND DRIVE CHAIN REMOVAL

(1) Support transfer case so rear case is facing upward.

(2) Remove bolts holding front case to rear case. The case alignment bolts require flat washers (Fig. 18).

(3) Loosen rear case with flat blade screwdriver to break sealer bead. Insert pry tool blade only into notches provided at each end of case (Fig. 19).

(4) Remove rear case from front case.

Fig. 18 Rear Case Alignment Bolt Locations

ASSEMBLY

Lubricate transfer case components with Mopar® Dexron II automatic transmission fluid or petroleum jelly (where indicated) during assembly.

BEARING AND SEAL INSTALLATION

CAUTION: The bearing bores in various transfer case components contain oil feed holes. Make sure replacement bearings do not block the holes.

(1) Remove the front output shaft seal from case with pry tool (Fig. 40).

(2) Remove the front output shaft bearing retaining ring with screwdriver (Fig. 41).

(3) Remove bearing with Tool Handle C-4171 and Tool 5065 (Fig. 42).

**Fig. 40 Front Output Seal Removal**

(4) Install front output shaft front bearing in case with Tool Handle C-4171 and Installer 5064 (Fig. 43).

**Fig. 43 Front Output Shaft Bearing Installation**

- 1 - SPECIAL TOOL C-4171
- 2 - SPECIAL TOOL 5064

(5) Install output shaft front bearing retaining ring (Fig. 44). Start ring into place by hand. Then use small screwdriver to work ring into case groove. Be sure ring is fully seated before proceeding.

**Fig. 44 Installing Output Shaft Front Bearing Retaining Ring**

- 1 - WORK RETAINING RING INTO BORE GROOVE WITH SMALL SCREWDRIVER

(6) Install new front output seal in front case with Installer Tool 8143 as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 45). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

**Fig. 45 Front Output Seal Installation**

- 1 - INSTALLER 8143
- 2 - TRANSFER CASE

(7) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 46).

(8) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 47). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 48).

(10) Install locating ring on new bearing.
 (11) Position case so forward end is facing upward.
 (12) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated against case surface (Fig. 50).

(13) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 51).

(14) Install new pilot bearing with Installer 5065 and Handle C-4171 (Fig. 52).

- 2 - SPECIAL TOOL 5064
- 3 - REAR RETAINER

INPUT AND LOW RANGE GEAR ASSEMBLY

(1) Lubricate gears and thrust washers (Fig. 56) with recommended transmission fluid.

(2) Install first thrust washer in low range gear (Fig. 56). Be sure washer tabs are properly aligned in gear notches.

(3) Install input gear in low range gear. Be sure input gear is fully seated.

(4) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(5) Install retainer on input gear and install snap-ring.

Fig. 56 Input/Low Range Gear Components

- 1 - SNAP RING
- 2 - RETAINER PLATE
- 3 - INPUT GEAR
- 4 - LOW RANGE GEAR
- 5 - THRUST WASHERS

INPUT GEAR AND LOW RANGE GEAR INSTALLATION

(1) Align and install low range/input gear assembly in front case (Fig. 57). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

(2) Install snap-ring to hold input/low range gear into front bearing (Fig. 58).

(3) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(4) Apply a 3 mm (1/8 in.) bead of Mopar® gasket maker or silicone adhesive to sealing surface of retainer.

(5) Align cavity in seal retainer with fluid return hole in front of case.

CAUTION: Do not block fluid return cavity on sealing surface of retainer when applying Mopar® gasket maker or silicone adhesive sealer. Seal failure and fluid leak can result.

(6) Install bolts to hold retainer to transfer case (Fig. 59). Tighten to 21 N·m (16 ft. lbs.) of torque.

DISASSEMBLY AND ASSEMBLY (Continued)

- 1 - INPUT GEAR
2 - SNAP RING

**Fig. 60 Sector O-Ring And Bushing Installation**

- 1 - SECTOR BUSHING
2 - O-RING

MAINSHAFT ASSEMBLY

- (1) Lubricate mainshaft splines with recommended transmission fluid.
- (2) Slide drive sprocket onto mainshaft.
- (3) Slide mode hub onto mainshaft.
- (4) Install mode hub retaining ring. Verify that the retaining ring is fully seated in mainshaft groove.

SHIFT FORKS AND MAINSHAFT INSTALLATION

- (1) Install new sector shaft O-ring and bushing (Fig. 60).
- (2) Install shift sector in case (Fig. 61). Lubricate sector shaft with transmission fluid before installation.

- (3) Install range lever, washer, and nut on sector shaft (Fig. 62). Tighten range lever nut to 27–34 N.m (20–25 ft. lbs.) torque.

- (4) Assemble and install range fork and hub (Fig. 63). Be sure hub is properly seated in low range gear and engaged to the input gear.

- (5) Align and insert range fork pin in shift sector slot.

- (6) Install assembled mainshaft (Fig. 64). Be sure shaft is seated in pilot bearing and input gear.

- (7) Install new pads on mode fork if necessary.

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 61 Shift Sector Installation

1 - SHIFT SECTOR

8001096c

Fig. 64 Mainshaft Assembly Installation

1 - DRIVE SPROCKET
2 - MODE HUB
3 - MAINSHAFT

(8) Insert mode sleeve in mode fork mode fork. Be sure long side of sleeve is toward long end of shift rail (Fig. 65).

Fig. 62 Range Lever Installation

1 - RANGE LEVER
2 - LEVER NUT

80010971

Fig. 65 Assembling Mode Fork And Sleeve

1 - MODE SLEEVE
2 - MODE FORK AND RAIL

(9) Install assembled mode fork and sleeve (Fig. 66). Be sure fork rail goes through range fork and into case bore. Also be sure sleeve is aligned and seated on mainshaft hub.

(10) Rotate sector to Neutral position.

(11) Install new O-ring on detent plug (Fig. 67).

(12) Lubricate detent plunger with transmission fluid or light coat of petroleum jelly.

(13) Install detent plunger, spring and plug (Fig. 67).

(14) Verify that plunger is properly engaged in sector.

Fig. 63 Install Range Fork And Hub Assembly

1 - RANGE HUB
2 - RANGE FORK

FRONT OUTPUT SHAFT AND DRIVE CHAIN INSTALLATION

(1) Lubricate front output shaft-sprocket assembly, drive chain, and drive sprocket with transmission fluid.

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 66 Mode Fork And Sleeve Installation**

- 1 - MODE SLEEVE
- 2 - MODE FORK AND RAIL

**Fig. 68 Installing Drive Chain And Front Output Shaft**

- 1 - FRONT OUTPUT SHAFT

- 4 - DRIVE SPROCKET

**Fig. 67 Shift Detent Components**

- 1 - POPPET
- 2 - SPRING
- 3 - SCREW
- 4 - POPPET BORE (IN CASE)

(2) Assemble drive chain and front output shaft (Fig. 68).

(3) Start chain on mainshaft drive sprocket.

(4) Guide front shaft into bearing and drive sprocket onto mainshaft drive gear (Fig. 68).

(5) Install mode spring on upper end of mode fork shift rail (Fig. 69).

OIL PUMP AND REAR CASE ASSEMBLY/INSTALLATION

(1) Install magnet in front case pocket (Fig. 70).

(2) Assemble oil pickup screen, connecting hose, and tube.

(3) Install new pickup tube O-ring in oil pump (Fig. 71).

**Fig. 69 Install Mode Fork Spring**

- 1 - MODE SPRING

(4) Insert oil pickup tube in oil pump inlet.

(5) Position assembled oil pump and pickup tube in rear case. Be sure pickup screen is securely seated in case slot. Also be sure oil pump locating tabs are outside rear case (Fig. 72).

(6) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to mounting

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 70 Installing Case Magnet

1 - MAGNET

Fig. 71 Pickup Tube O-Ring Position

1 - OIL PUMP
2 - O-RING

flange of front case. Work sealer bead around bolt holes.

(7) Lift rear case and oil pump and carefully position assembly on front case. Be sure case dowels are aligned and that mode fork rail extends through rear case before seating rear case on front case.

(8) Install case attaching bolts. Alignment bolts at each end of case are only ones requiring washers (Fig. 73).

(9) Tighten case bolts to 27-34 N·m (20-25 ft. lbs.) torque.

YOKE AND RANGE LEVER INSTALLATION

(1) Install indicator switch in front case. Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque.

Fig. 72 Oil Pump And Pickup Tube Installation

1 - OIL PUMP
2 - PICKUP TUBE
3 - PICKUP SCREEN AND CONNECTOR

Fig. 73 Alignment Bolt Location

1 - ALIGNMENT BOLT AND WASHER (AT EACH END OF CASE)

(2) Install range lever, washer and locknut on sector shaft (Fig. 74). Tighten locknut to 27-34 N·m (20-25 ft. lbs.) torque.

(3) Install new seal washer on front output shaft (Fig. 76).

(4) Lubricate yoke hub with transmission fluid and install yoke on front shaft.

(5) Install new seal washer on front shaft.

(6) Install yoke and new yoke nut on front output shaft (Fig. 75).

(7) Tighten yoke nut to 122-176 N·m (90-130 ft. lbs.) torque. Use Tool C-3281, or similar tool to hold yoke while tightening yoke nut.

REAR RETAINER INSTALLATION

(1) Apply bead of Mopar® Sealer P/N 82300234, or Loctite® Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 inch.

(2) Install rear retainer on rear case. Tighten retainer bolts to 20-27 N·m (15-20 ft. lbs.) torque.

(3) Install rear bearing I. D. retaining ring and spacer on output shaft.

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 74 Range Lever Installation**

- 1 - RANGE LEVER
- 2 - WASHER
- 3 - LOCKNUT

**Fig. 75 Output Shaft Yoke Installation**

- 1 - OUTPUT SHAFT YOKE
- 2 - YOKE NUT

**Fig. 76 Yoke Seal Washer Installation**

- 1 - YOKE SEAL WASHER

(4) Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.

(5) Slide seal onto Seal Protector 6992 (Fig. 77). Slide seal protector and seal onto output shaft.

(6) Slide Installer C-4076-B onto seal protector with the recessed side of the tool toward the seal. Drive seal into rear bearing retainer with Installer C-4076-B and Handle MD-998323 (Fig. 78).

**Fig. 77 Output Shaft Seal and Protector**

- 3 - TRANSFER CASE

**Fig. 78 Rear Seal Installation**

- 1 - SPECIAL TOOL C-4076-B
- 2 - SPECIAL TOOL MD998323
- 3 - TRANSFER CASE

(7) Install rear slinger with Installer 8408.

(8) Install boot on output shaft slinger and crimp retaining clamp with tool C-4975-A (Fig. 79).

CLEANING AND INSPECTION (Continued)

80a50357

Fig. 79 Slinger Boot Installation

- 1 - SPECIAL TOOL C-4975-A
- 2 - SLINGER
- 3 - BOOT
- 4 - CLAMP

CLEANING AND INSPECTION

NV231 TRANSFER CASE

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

The oil pickup screen can be cleaned with solvent. Shake excess solvent from the screen after cleaning and allow it to air dry. Do not use compressed air.

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket (Fig. 80). Minor nicks and scratches can be smoothed with an oilstone. However, replace any part that is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 81). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

80c070b9

- 1 - PLANETARY CARRIER
- 2 - REAR THRUST WASHER
- 3 - FRONT THRUST WASHER

- 4 - CARRIER LOCK RING
- 5 - CARRIER LOCK RETAINING RING
- 6 - INPUT GEAR

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 82). Minor nicks on the shift rail can be smoothed with 320–400 grit emery cloth.

80010948

Fig. 82 Shift forks

- 1 - RANGE FORK
- 2 - MODE FORK AND RAIL
- 3 - MODE SPRING

The fork must be replaced as an assembly if the pads are worn or damaged.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

REAR RETAINER/BEARING/ SEAL/SLINGER/BOOT

Inspect the retainer components (Fig. 84). Replace the bearing if rough or noisy. Check the retainer for

8001097c

Fig. 83 Shift Fork And Wear Pad Locations

- 1 - RANGE FORK
- 2 - MODE FORK
- 3 - WEAR PADS (SERVICEABLE)
- 4 - WEAR PADS (NON-SERVICEABLE)

Inspect the shift fork wear pads (Fig. 83). The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are not serviceable.

CLEANING AND INSPECTION (Continued)

cracks or wear in the bearing bore. Clean the retainer sealing surfaces with a scraper and 3M all purpose cleaner. This will ensure proper adhesion of the sealer during reassembly.

Replace the slinger and seal outright; do not reuse either part.

Replace any part if distorted, bent, or broken. Also replace the boot if cut or torn. Replace the boot band clamps, do not reuse them.

REAR OUTPUT SHAFT/YOKE/DRIVE CHAIN

Check condition of the seal contact surfaces of the yoke slinger (Fig. 85). This surface must be clean and smooth to ensure proper seal life. Replace the yoke nut and seal washer as neither part should be reused.

Inspect the shaft threads, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320–400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the threads are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 86)

FRONT-REAR CASES AND FRONT RETAINER

Inspect the cases and retainer for wear and damage. Clean the sealing surfaces with a scraper and 3M all purpose cleaner. This will ensure proper sealer adhesion at assembly. Replace the input retainer seal; do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

2 - SEAL CONTACT SURFACE MUST BE CLEAN AND SMOOTH

**Fig. 86 Low Range Annulus Gear**

- 1 - FRONT CASE
2 - LOW RANGE ANNULUS GEAR

Check the front case mounting studs and vent tube. The tube can be secured with Loctite 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete

assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ADJUSTMENTS**SHIFT LINKAGE ADJUSTMENT**

- (1) Shift transfer case into 4L position.
- (2) Raise vehicle.
- (3) Loosen lock bolt on adjusting trunnion (Fig. 87).
- (4) Be sure linkage rod slides freely in trunnion. Clean rod and apply spray lube if necessary.
- (5) Verify that transfer case range lever is fully engaged in 4L position.
- (6) Tighten adjusting trunnion lock bolt.
- (7) Lower vehicle.

DESCRIPTION AND OPERATION

NV242 TRANSFER CASE

DESCRIPTION

The NV242 is a full-time transfer case (Fig. 1). It provides full time 2-wheel, or 4-wheel drive operation.

A differential in the transfer case is used to control torque transfer to the front and rear axles. A low range gear provides increased low speed torque capability for off road operation. The low range provides a 2.72:1 reduction ratio.

Fig. 1 NV242 Transfer Case

The input gear is splined to the transmission output shaft. It drives the mainshaft through the planetary gear and range hub. The front output shaft is operated by a drive chain that connects the shaft to a

drive sprocket on the mainshaft. The drive sprocket is engaged/disengaged by the mode fork, which operates the mode sleeve and hub. The sleeve and hub are not equipped with a synchro mechanism for shifting.

The geartrain is mounted in two aluminum case halves attached with bolts. The mainshaft front and rear bearings are mounted in aluminum retainer housings bolted to the case halves.

TRANSFER CASE IDENTIFICATION

A circular ID tag is attached to the rear case of each transfer case (Fig. 2). The ID tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

Fig. 2 Fill/Drain Plug And I. D. Tag Locations

- 1 - I. D. TAG
- 2 - FILL PLUG
- 3 - DRAIN PLUG

DESCRIPTION AND OPERATION (Continued)

OPERATING RANGES

NV242 operating ranges are 2WD (2-wheel drive), 4x4 part-time, 4x4 full time, and 4 Lo.

The 2WD and 4x4 full time ranges can be used at any time and on any road surface.

The 4x4 part-time and 4 Lo ranges are for off road use only. The only time these ranges can be used on hard surface roads, is when the surface is covered with snow and ice.

SHIFT MECHANISM

Operating ranges are selected with a floor mounted shift lever. The shift lever is connected to the transfer case range lever by an adjustable linkage rod. A straight line shift pattern is used. Range positions are marked on the shifter bezel cover plate, or on the shift knob.

LUBRICANT AND FILL LEVEL

DESCRIPTION

Recommended lubricant for the NV242 transfer case is Mopar® Dexron II, or ATF Plus, type 7176. Approximate lubricant fill capacity is 1.35 liters (2.85 pints).

The fill and drain plugs are both in the rear case (Fig. 3). Correct fill level is to the bottom edge of the

fill plug hole. Be sure the vehicle is level to ensure an accurate fluid level check.

DIAGNOSIS AND TESTING

NV242 DIAGNOSIS

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case difficult to shift or will not shift into desired range.	1) Transfer case shift linkage binding.	1) Repair or replace linkage as necessary.
	2) Insufficient or incorrect lubricant.	2) Drain and refill transfer case with the correct type and quantity of lubricant.
	3) Internal transfer case components binding, worn, or damaged.	3) Repair or replace components as necessary.
Transfer case noisy in all drive modes.	1) Insufficient or incorrect lubricant.	1) Drain and refill transfer case with the correct type and quantity of lubricant.
Lubricant leaking from transfer case seals or vent.	1) Transfer case overfilled.	1) Drain lubricant to the correct level.
	2) Transfer case vent closed or restricted.	2) Clean or replace vent as necessary.
	3) Transfer case seals damaged or installed incorrectly.	3) Replace suspect seal.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSE	CORRECTION
Transfer case will not shift through 4X4 part time range (light remains on)	1) Incomplete shift due to drivetrain torque load.	1) Momentarily release the accelerator pedal to complete the shift.
	2) Incorrect tire pressure.	2) Correct tire pressure as necessary.
	3) Excessive Tire wear.	3) Correct tire condition as necessary.
	4) Excessive vehicle loading.	4) Correct as necessary.

REMOVAL AND INSTALLATION

TRANSFER CASE

REMOVAL

- (1) Shift transfer case into Neutral.
- (2) Raise vehicle.
- (3) Drain transfer case lubricant.
- (4) Mark front and rear propeller shaft yokes for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove rear crossmember, or skid plate.
- (7) Disconnect front/rear propeller shafts at transfer case.
- (8) Disconnect vehicle speed sensor wires.
- (9) Disconnect transfer case linkage rod from range lever.
- (10) Disconnect transfer case vent hose (Fig. 4) and indicator switch harness, if necessary.
- (11) Support transfer case with transmission jack.
- (12) Secure transfer case to jack with chains.
- (13) Remove nuts attaching transfer case to transmission.
- (14) Pull transfer case and jack rearward to disengage transfer case.
- (15) Remove transfer case from under vehicle.

INSTALLATION

- (1) Mount transfer case on a transmission jack.
- (2) Secure transfer case to jack with chains.
- (3) Position transfer case under vehicle.
- (4) Align transfer case and transmission shafts and install transfer case on transmission.
- (5) Install and tighten transfer case attaching nuts to 35 N·m (26 ft. lbs.) torque (Fig. 4).
- (6) Connect vehicle speed sensor wires, and vent hose.
- (7) Connect indicator switch harness to transfer case switch, if necessary. Secure wire harness to clips on transfer case.
- (8) Align and connect propeller shafts. Refer to Group 3, Differential and Driveline, for proper procedures and specifications.

**Fig. 4 Transfer Case Mounting**

- 1 – VENT TUBE
2 – TRANSFER CASE
3 – TRANSMISSION

- (9) Fill transfer case with correct fluid. Check transmission fluid level. Correct as necessary.
- (10) Install rear crossmember, or skid plate. Tighten crossmember bolts to 41 N·m (30 ft. lbs.) torque.
- (11) Remove transmission jack and support stand.
- (12) Connect shift rod to transfer case range lever.
- (13) Adjust transfer case shift linkage.
- (14) Lower vehicle and verify transfer case shift operation.

SHIFT LEVER

REMOVAL

- (1) Shift transfer case into 4L.
- (2) Raise vehicle.
- (3) Loosen adjusting trunnion locknut and slide shift rod out of trunnion (Fig. 5). If rod lacks enough travel to come out of trunnion, push trunnion out of torque shaft.
- (4) Lower vehicle.
- (5) Remove console. Refer to Group 23, Body, for proper procedures.

REMOVAL AND INSTALLATION (Continued)

(6) Remove screws attaching lever assembly to floorpan and remove assembly and shift rod (if left attached).

INSTALLATION

(1) If shift rod was not removed from lever assembly, work rod down through floorpan opening. Then position lever assembly on floorpan and install assembly attaching screws.

(2) Install console. Refer to Group 23, Body, for proper procedures.

(3) Raise vehicle.

(4) Connect trunnion to torque shaft arm. Or, slide shift rod into trunnion on range lever. Be sure shift rod slides freely in trunnion.

(5) Verify that range lever is in 4L position. Then tighten trunnion lock bolt.

(6) Lower vehicle and check transfer case shift operation.

SPEEDOMETER

REMOVAL

(1) Raise vehicle.

(2) Disconnect wires from vehicle speed sensor.

(3) Remove adapter clamp and screw (Fig. 6).

(4) Remove speed sensor and speedometer adapter as an assembly.

(5) Remove speed sensor retaining screw and remove sensor from adapter.

(6) Remove speedometer pinion from adapter. Replace pinion if chipped, cracked, or worn.

(7) Inspect sensor and adapter O-rings (Fig. 6). Remove and discard O-rings if worn or damaged.

(8) Inspect terminal pins in speed sensor. Clean pins with Mopar® electrical spray cleaner if dirty or oxidized. Replace sensor if faulty, or if pins are loose, severely corroded, or damaged.

- 1 – SENSOR O-RING
- 2 – SPEEDOMETER ADAPTER
- 3 – ADAPTER O-RING

- 4 – SPEEDOMETER PINION
- 5 – ADAPTER CLAMP
- 6 – VEHICLE SPEED SENSOR

INSTALLATION AND INDEXING

(1) Thoroughly clean adapter flange and adapter mounting surface in housing. Surfaces must be clean for proper adapter alignment and speedometer operation.

(2) Install new O-rings on speed sensor and speedometer adapter (Fig. 6), if necessary.

(3) Lubricate sensor and adapter O-rings with transmission fluid.

(4) Install vehicle speed sensor in speedometer adapter. Tighten sensor attaching screw to 2-3 N·m (15-27 in. lbs.) torque.

(5) Install speedometer pinion in adapter.

(6) Count number of teeth on speedometer pinion. Do this before installing assembly in housing. Then lubricate pinion teeth with transmission fluid.

(7) Note index numbers on adapter body (Fig. 7). These numbers will correspond to number of teeth on pinion.

(8) Install speedometer assembly in housing.

(9) Rotate adapter until required range numbers are at 6 o'clock position. Be sure range index numbers correspond to number of teeth on pinion gear.

(10) Install speedometer adapter clamp and retaining screw. Tighten clamp screw to 10-12 N·m (90-110 in. lbs.) torque.

(11) Connect wires to vehicle speed sensor.

(12) Lower vehicle and top off transmission fluid level if necessary.

J9321-386

FRONT OUTPUT SHAFT SEAL

REMOVAL

- (1) Raise vehicle.
- (2) Remove front propeller shaft. Refer to Group 3, Differential and Driveline, for proper procedure.

REMOVAL AND INSTALLATION (Continued)

- (3) Remove front output shaft yoke.
- (4) Remove seal from front case with pry tool (Fig. 8).

**Fig. 8 Remove Front Output Shaft Seal**

- 1 - OUTPUT SHAFT SEAL
2 - PRYBAR

INSTALLATION

(1) Install new front output seal in front case with Installer Tool 6952-A as follows:

(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

(b) Start seal in bore with light taps from hammer (Fig. 9). Once seal is started, continue tapping seal into bore until installer tool seats against case.

**Fig. 9 Front Output Seal Installation**

DISASSEMBLY AND ASSEMBLY

NV242 TRANSFER CASE

DISASSEMBLY

REAR RETAINER REMOVAL

(1) Remove output shaft boot. Spread band clamp that secures boot on slinger with a suitable awl. Then slide boot off shaft (Fig. 10).

**Fig. 10 Output Boot—Typical**

- 1 - SLINGER
2 - BOOT
3 - AWL
4 - TRANSFER CASE

(2) Using puller MD-998056-A, remove rear slinger (Fig. 11).

**Fig. 11 Rear Slinger Removal**

- 1 - TRANSFER CASE
2 - SPECIAL TOOL MD998056-A
3 - SLINGER

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Remove rear seal from retainer (Fig. 12). Use pry tool, or collapse seal with punch to remove it.

80c070b7

Fig. 12 Rear Seal Removal

- 1 - REAR RETAINER
- 2 - OUTPUT SHAFT SEAL

(4) Remove rear output bearing I. D. retaining ring (Fig. 13).

80c070b8

Fig. 13 Rear Bearing I. D. Retaining Ring Removal

- 1 - SNAP RING PLIERS
- 2 - REAR BEARING I. D. RETAINING RING

(5) Remove speedometer adapter.
(6) Remove rear retainer bolts.
(7) Remove rear retainer. Tap retainer with mallet and pry upward to break sealer bead. Then slide retainer off case and output shaft (Fig. 14).

(8) Remove rear bearing O. D. retaining ring with snap ring pliers. Then tilt pump and slide it off output shaft (Fig. 15)

(9) Remove pickup tube O-ring from pump (Fig. 16) but do not disassemble pump; it is not a repairable part.

(10) Remove seal from oil pump with pry tool.

- 3 - PICKUP TUBE

YOKE AND RANGE LEVER REMOVAL

- (1) Remove front yoke nut:
 - (a) Move range lever to 4L position.
 - (b) Remove nut with socket and impact wrench (Fig. 20).

800010957

Fig. 20 Yoke Nut Removal

- 1 - IMPACT WRENCH
- 2 - SOCKET
- 3 - YOKE

(2) Remove yoke. If yoke is difficult to remove by hand, remove it with bearing splitter, or with standard two jaw puller (Fig. 21). Be sure puller tool is positioned on yoke and not on slinger as slinger will be damaged.

DISASSEMBLY AND ASSEMBLY (Continued)

80010977

Fig. 21 Yoke Removal

- 1 - PULLER TOOL
2 - YOKE

(3) Remove seal washer from front output shaft. Discard washer as it should not be reused.

(4) Remove nut and washer that attach range lever to sector shaft. Then move sector to neutral position and remove range lever from shaft (Fig. 22).

80010943

- 1 - RANGE LEVER
2 - SECTOR SHAFT

FRONT OUTPUT SHAFT AND DRIVE CHAIN REMOVAL

- (1) Remove drive sprocket snap-ring (Fig. 23).
- (2) Remove drive sprocket and chain (Fig. 24).
- (3) Remove front output shaft (Fig. 25).

SHIFT FORKS AND MAINSHAFT REMOVAL AND DISASSEMBLY

- (1) Remove shift detent plug, spring and pin (Fig. 26).
- (2) Remove seal plug from low range fork lockpin access hole. Then move shift sector to align low range fork lockpin with access hole.
- (3) Remove range fork lockpin with size number one easy-out tool as follows:

J8921-251

Fig. 23 Drive Sprocket Snap-Ring Removal

- 1 - DRIVE SPROCKET
2 - DRIVE SPROCKET SNAP RING

J8921-252

Fig. 24 Drive Sprocket And Chain Removal

- 1 - DRIVE SPROCKET
2 - DRIVE CHAIN

(a) Insert easy-out tool through access hole in side of transfer case and into lock-pin.

(b) Tap easy-out tool into lock-pin with hammer until tool is securely engaged into the lock-pin.

- 3 - OIL PUMP FEED HOUSING

(15) Install new pickup tube O-ring in oil pump (Fig. 60).

**Fig. 60 Pickup Tube O-Ring Installation**

- 1 - PICKUP TUBE O-RING

DIFFERENTIAL ASSEMBLY

(1) Lubricate differential components with automatic transmission fluid.

(2) Install sprocket gear in differential bottom case (Fig. 61).

(3) Install differential planet gears and new thrust washers (Fig. 62). **Be sure thrust washers are installed at top and bottom of each planet gear.**

**Fig. 61 Installing Differential Sprocket Gear**

- 1 - SPROCKET GEAR
- 2 - BOTTOM CASE

(4) Install differential mainshaft gear (Fig. 62).

(5) Align and position differential top case on bottom case (Fig. 63). Align using scribe marks made at disassembly.

(6) While holding differential case halves together, invert the differential and start the differential case bolts.

(7) Tighten differential case bolts to specified torque.

INPUT GEAR/LOW RANGE ASSEMBLY

(1) Assemble low range gear, input gear thrust washers, input gear and input gear retainer (Fig. 64).

(2) Install low range gear snap ring (Fig. 65).

DISASSEMBLY AND ASSEMBLY (Continued)

**Fig. 62 Installing Mainshaft And Planet Gears**

DISASSEMBLY AND ASSEMBLY (Continued)

- (3) Lubricate input gear and low range gears with automatic transmission fluid.
- (4) Start input gear shaft into front case bearing.
- (5) Press input gear shaft into front bearing.
- (6) Install new input gear snap ring (Fig. 66).

J8921-267

Fig. 66 Input Gear Snap Ring Installation

- 1 - INPUT GEAR
2 - SNAP RING

- (7) Apply 3 mm (1/8 in.) wide bead of Mopar® gasket maker or silicone adhesive sealer to seal surface of front bearing retainer.

- (8) Install front bearing retainer (Fig. 67). Tighten retainer bolts to 16 ft. lbs. (21 N-m) torque.

J8921-276

Fig. 67 Installing Front Bearing Retainer

- 1 - FRONT BEARING RETAINER

SHIFT FORKS AND MAINSHAFT INSTALLATION

- (1) Install new sector shaft O-ring and bushing (Fig. 68).

J8921-277

Fig. 68 Sector O-Ring And Bushing Installation

- 1 - SECTOR BUSHING
2 - O-RING

- (2) Install shift sector.
- (3) Install new pads on low range fork, if necessary, (Fig. 69).
- (4) Assemble low range fork and hub (Fig. 69).

J8921-278

Fig. 69 Assembling Low Range Fork And Hub

- 1 - LOW RANGE FORK
2 - PADS
3 - HUB

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Position low range fork and hub in case. Be sure low range fork pin is engaged in shift sector slot (Fig. 70).

Fig. 70 Positioning Low Range Fork

- 1 - SHIFT SECTOR
- 2 - LOW RANGE FORK
- 3 - PIN
- 4 - SLOT

(6) Install first mainshaft bearing spacer on mainshaft (Fig. 71).

(7) Install bearing rollers on mainshaft (Fig. 71). **Coat bearing rollers with generous quantity of petroleum jelly to hold them in place.**

(8) Install remaining bearing spacer on mainshaft (Fig. 71). Do not displace any bearings while installing spacer.

(9) Install differential (Fig. 72). **Do not displace mainshaft bearings when installing differential.**

(10) Install differential snap-ring (Fig. 73).

(11) Install intermediate clutch shaft (Fig. 74).

(12) Install clutch shaft thrust washer (Fig. 75).

(13) Install clutch shaft snap-ring (Fig. 76).

(14) Inspect mode fork assembly (Fig. 77). Replace pads and bushing if necessary. Replace fork tube if bushings inside tube are worn or damaged. Also check springs and slider bracket (Fig. 77). Replace worn, damaged components.

Fig. 71 Installing Mainshaft Bearing Rollers and Spacers

J8921-284

Fig. 77 Mode Fork Assembly Inspection

- 1 - SLIDER
- 2 - MODE FORK
- 3 - BUSHING/SPRING
- 4 - TUBE
- 5 - PADS

(15) Install mode sleeve in mode fork (Fig. 78). Then install assembled sleeve and fork on mainshaft. Be sure mode sleeve splines are engaged in differential splines.

(16) Install mode fork and mainshaft assembly in case (Fig. 79). Rotate mainshaft slightly to engage shaft with low range gears.

(17) Rotate mode fork pin into shift sector slot.

(18) Install shift rail (Fig. 80). **Be sure rail is seated in both shift forks.**

(19) Rotate shift sector to align lockpin hole in low range fork with access hole in case.

(20) Insert an easy-out in range fork lockpin to hold it securely for installation (Fig. 81). **Lockpin is slightly tapered on one end. Insert tapered end into fork and rail.**

(21) Insert lockpin through access hole and into shift fork (Fig. 81). Then remove easy-out and seat the pin with pin punch.

J8921-257

Fig. 78 Installing Mode Fork And Sleeve

- 1 - MAINSHAFT
- 2 - SLEEVE
- 3 - MODE FORK ASSEMBLY

(22) Install plug in lockpin access hole.

(23) Install detent plunger, detent spring and detent plug in case (Fig. 82).

FRONT OUTPUT SHAFT AND DRIVE CHAIN INSTALLATION

(1) Install front output shaft (Fig. 83).

(2) Install drive chain (Fig. 83). Engage chain with front output shaft sprocket teeth.

(3) Install drive sprocket (Fig. 83). Engage drive sprocket teeth with chain. Then engage sprocket splines with mainshaft splines.

DISASSEMBLY AND ASSEMBLY (Continued)

Fig. 79 Assembled Mainshaft And Mode Fork Installation

J8921-251

Fig. 84 Drive Sprocket Snap-Ring Installation

- 1 - DRIVE SPROCKET
- 2 - DRIVE SPROCKET SNAP RING

OIL PUMP AND REAR CASE INSTALLATION

(1) Insert oil pickup tube in oil pump and attach oil screen and connector hose to pickup tube. Then install assembled pump, tube and screen in rear case (Fig. 85). Be sure screen is seated in case slot as shown.

(2) Install magnet in front case pocket (Fig. 86).

J8921-287

Fig. 85 Oil Screen And Pickup Tube Installation

- 1 - OIL PUMP
- 2 - OIL SCREEN
- 3 - CONNECTOR
- 4 - PICKUP TUBE

J8921-288

Fig. 86 Installing Case Magnet

- 1 - MAGNET

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Apply 3 mm (1/8 in.) wide bead of Mopar gasket maker or silicone adhesive sealer to seal surface of front case.

(4) Align and install rear case on front case. Be sure case locating dowels are in place and that main-shaft splines are engaged in oil pump inner gear.

(5) Install and tighten front case-to-rear case bolts to 41 N·m (30 ft. lbs.) torque. **Be sure to install a washer under each bolt used at case dowel locations.**

REAR RETAINER INSTALLATION

(1) Remove rear bearing in retainer using Installer 8128 and Handle C-4171.

(2) Install rear bearing in retainer with Tools C-4171 and 5064 (Fig. 87).

Fig. 87 Installing Rear Bearing In Retainer

- 1 - SPECIAL TOOL C-4171
- 2 - SPECIAL TOOL 5064
- 3 - REAR RETAINER

(3) Install rear bearing O. D. retaining ring with snap-ring pliers (Fig. 88). Be sure retaining ring is fully seated in retainer groove.

(4) Apply bead of Mopar® Sealer P/N 82300234, or Loctite® Ultra Gray, to mating surface of rear retainer. Sealer bead should be a maximum of 3/16 in.

(5) Install rear retainer on rear case. Tighten retainer bolts to 20–27 N·m (15–20 ft. lbs.) torque.

(6) Install rear bearing I. D. retaining ring and spacer on output shaft.

(7) Apply liberal quantity of petroleum jelly to new rear seal and to output shaft. Petroleum jelly is needed to protect seal lips during installation.

(8) Slide seal onto Seal Protector 6992 (Fig. 89). Slide seal protector and seal onto output shaft.

(9) Slide Installer C-4076-B onto seal protector with the recessed side of the tool toward the seal.

800bdfae

Fig. 88 Rear Bearing Retaining Ring Installation

- 1 - REAR BEARING O. D. RETAINING RING

Drive seal into rear bearing retainer with Installer C-4076-B and Handle MD-998323 (Fig. 90).

80a50355

Fig. 89 Output Shaft Seal and Protector

- 1 - OUTPUT SHAFT SEAL
- 2 - SPECIAL TOOL 6992
- 3 - TRANSFER CASE

(10) Install rear slinger with Installer 8408.

(11) Install boot on output shaft slinger and crimp retaining clamp with tool C-4975-A (Fig. 91).

FRONT YOKE AND SWITCH INSTALLATION

(1) Install indicator switch in front case. Tighten switch to 20–34 N·m (15–25 ft. lbs.) torque.

(2) Lubricate yoke hub with transmission fluid and install yoke on front shaft.

(3) Install new seal washer on front shaft.

(4) Install yoke on front shaft. Secure yoke with new nut.

CLEANING AND INSPECTION

NV242 TRANSFER CASE

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

The oil pickup screen can be cleaned with solvent. Shake excess solvent from the screen after cleaning and allow it to air dry. Do not use compressed air.

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket. Minor nicks and scratches can be smoothed with an oilstone. However, replace any part is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320-400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 92). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300-400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 93). Minor nicks on the shift rail can be smoothed with 320-400 grit emery cloth.

Inspect the shift fork wear pads. The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are also serviceable.

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

REAR RETAINER/BEARING/ SEAL/SLINGER/BOOT

Inspect the retainer components (Fig. 94). Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore. Clean the retainer sealing surfaces with a scraper and all purpose cleaner. This will ensure proper adhesion of the sealer during reassembly.

Replace the slinger and seal outright; do not reuse either part.

Inspect the retaining rings and washers. Replace any part if distorted, bent, or broken. Reuse is not recommended. Also replace the boot if cut or torn. Replace the boot band clamps, do not reuse them.

REAR OUTPUT SHAFT/YOKE/DRIVE CHAIN

Check condition of the seal contact surfaces of the yoke slinger (Fig. 95). This surface must be clean and smooth to ensure proper seal life. Replace the yoke nut and seal washer as neither part should be reused.

CLEANING AND INSPECTION (Continued)

- 6 - INPUT GEAR

80010948

Fig. 93 Shift forks

- 1 - RANGE FORK
- 2 - MODE FORK AND RAIL
- 3 - MODE SPRING

Inspect the shaft threads, sprocket teeth, and bearing surfaces. Minor nicks on the teeth can be smoothed with an oilstone. Use 320–400 grit emery to smooth minor scratches on the shaft bearing surfaces. Rough threads on the shaft can be chased if necessary. Replace the shaft if the threads are damaged, bearing surfaces are scored, or if any sprocket teeth are cracked or broken.

Examine the drive chain and shaft bearings. Replace the chain and both sprockets if the chain is stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 96).

FRONT-REAR CASES AND FRONT RETAINER

Inspect the cases and retainer for wear and damage. Clean the sealing surfaces with a scraper and all purpose cleaner. This will ensure proper sealer adhesion at assembly. Replace the input retainer seal; do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with LoctiteTM 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary. Or the threads can be repaired with Helicoil stainless steel inserts if required.

CLEANING AND INSPECTION (Continued)

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ADJUSTMENTS

SHIFT LINKAGE ADJUSTMENT

- (1) Shift transfer case into 4L position.
- (2) Raise vehicle.
- (3) Loosen lock bolt on adjusting trunnion (Fig. 97).
- (4) Be sure linkage rod slides freely in trunnion. Clean rod and apply spray lube if necessary.
- (5) Verify that transfer case range lever is fully engaged in 4L position.
- (6) Tighten adjusting trunnion lock bolt.
- (7) Lower vehicle.

REMOVAL AND INSTALLATION		SPECIFICATIONS
TRANSMISSION - 2.5L TURBO DIESEL		TORQUE
ENGINE	1	4

REMOVAL AND INSTALLATION
TRANSMISSION - 2.5L TURBO DIESEL ENGINE

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the floor console, shifter boot and shifter. Refer to group 23, Body for the procedure.
3. Raise the vehicle on a hoist.
4. Drain the transmission fluid (Fig. 1).

Fig. 1 Drain Plug and Backup Light Switch Location

1 – GEAR CASE
2 – BACKUP LIGHT SWITCH
3 – DRAIN PLUG

5. Remove exhaust pipe and heat shield.
6. Mark the front and rear propeller shafts for installation alignment (Fig. 2).

Fig. 2 Marking Propeller Shaft and Axle Yoke

1 – MARK BOTH YOKES FOR ALIGNMENT AT INSTALLATION

7. Remove the front propeller shaft.
8. Remove the rear propeller shaft.
9. Remove the transmission skid plate.
10. Disconnect the transfer case linkage and vehicle speed sensor electrical connector and vent tube hose (Fig. 3).
11. Support the engine with an adjustable jack stand.
12. Place a transmission jack under the transmission and secure the transmission with safety chains.

REMOVAL AND INSTALLATION (Continued)

**Fig. 3 Vehicle Speed Sensor**

- 1 - SENSOR ELECTRICAL CONNECTOR
- 2 - 4WD TRANSFER CASE EXTENSION
- 3 - VEHICLE SPEED SENSOR

13. Remove the rear transmission mount.
14. Remove the rear crossmember.
15. Remove the transfer case assembly. Refer to Transfer Case removal later in this Group.
16. Lower the engine and transmission no more than 7.6 cm.
17. Remove the two (2) upper and two (2) mid clutch housing to engine bolts.
18. Remove the engine speed sensor (crankshaft position sensor) (Fig. 4).
19. Remove the clutch slave cylinder from the clutch housing.
20. Remove the lower transmission bolts.
21. Remove the transmission assembly from the vehicle.

INSTALLATION

1. Mount the transmission on a transmission jack and secure the transmission with safety chains.
2. Position the transmission in the vehicle (Fig. 5).
3. Install the two (2) lower transmission bolts. Tighten the bolts to 74.6 N-m.
4. Install the clutch slave cylinder on the clutch housing.
5. Install the engine speed sensor (crankshaft position sensor) on the vehicle (Fig. 4).

**Fig. 4 Engine Speed Sensor**

- 1 - ENGINE SPEED SENSOR
- 2 - GROMMET
- 3 - MOUNTING BOLT(S)
- 4 - LEFT REAR OF ENGINE
- 5 - TRANSMISSION

6. Install the two (2) upper clutch housing to engine bolts. Tighten the bolts to 36.6 N-m.
7. Install the two (2) mid clutch housing to engine bolts. Tighten the bolts to 58.3 N-m.
8. Raise the engine and transmission with the adjustable jackstand.
9. Install the transfer case assembly. Refer to Transfer Case installation later in this Group.
10. Install the rear crossmember.
11. Install the rear transmission mount.
12. Connect the transfer case linkage and vehicle speed sensor electrical connector and vent tube (Fig. 3).
13. Install the transmission skid plate.
14. Install the front and rear propeller shafts in their original position, using the reference marks scribed earlier.
15. Install the exhaust pipe and heat shield.
16. Remove the transmission jack.
17. Fill the transmission with the proper fluid (Fig. 7).
18. Remove the adjustable jackstand from under the engine.
19. Lower the vehicle from the hoist.
20. Install the shifter, shifter boot and floor console.
21. Reconnect the negative battery cable.
22. Using the DRB III Scan Tool clear any DTC's and reset customer preferences.

REMOVAL AND INSTALLATION

TRANSFER CASE

REMOVAL

- (1) Shift transfer case into Neutral.
- (2) Raise vehicle.
- (3) Drain transfer case lubricant.
- (4) Mark front and rear propeller shaft yokes for alignment reference.
- (5) Support transmission with jack stand.
- (6) Remove rear crossmember and skid plate, if equipped.
- (7) Disconnect and support front/rear propeller shafts at transfer case.
- (8) Disconnect vehicle speed sensor wires.
- (9) Disconnect transfer case linkage rod from range lever.
- (10) Disconnect transfer case vent hose (Fig. 1) and indicator switch harness, if necessary.
- (11) Support transfer case with transmission jack.
- (12) Secure transfer case to jack with chains.
- (13) Remove nuts attaching transfer case to transmission.
- (14) Pull transfer case and jack rearward to disengage transfer case.
- (15) Remove transfer case from under vehicle.

INSTALLATION

- (1) Mount transfer case on a transmission jack.
- (2) Secure transfer case to jack with chains.
- (3) Position transfer case under vehicle.
- (4) Align transfer case and transmission shafts and install transfer case on transmission.
- (5) Install and tighten transfer case attaching nuts to 35 N·m (Fig. 1).
- (6) Connect vehicle speed sensor wires, and vent hose.
- (7) Connect indicator switch harness to transfer case switch, if necessary. Secure wire harness to clips on transfer case.

NOTE: Do no reuse bearing straps or bolts. Discard and replace with new.

DESCRIPTION AND OPERATION

TIRES

DESCRIPTION

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code (Fig. 1).

Performance tires have a speed rating letter after the aspect ratio number.

LETTER	SPEED RATING
S	180 km/h (112 mph)
T	190 km/h (118 mph)
U	200 km/h (124 mph)
H	210 km/h (130 mph)
V	240 km/h (149 mph)
W	270 km/h (168 mph)
Y	300 km/h (186 mph)

The speed rating is not always printed on the tire sidewall.

DESCRIPTION AND OPERATION (Continued)

**Fig. 1 Tire Identification****TIRE CHAINS**

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

RADIAL-PLY TIRES**DESCRIPTION**

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 50 MPH is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufacturers on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires.

SPARE TIRE-TEMPORARY**DESCRIPTION**

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 50 M. P. H. when using the temporary spare tire. Refer to Owner's Manual for complete details.

TIRE INFLATION PRESSURES

Under inflation will cause rapid shoulder wear, tire flexing, and possible tire failure (Fig. 2).

**Fig. 2 Under Inflation Wear**

1 - THIN TIRE THREAD AREAS

Over inflation will cause rapid center wear and loss of the tire's ability to cushion shocks (Fig. 3).

**Fig. 3 Over Inflation Wear**

1 - THIN TIRE THREAD AREA

Improper inflation can cause:

- Uneven wear patterns

DESCRIPTION AND OPERATION (Continued)

- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Vehicle drift

For proper tire pressure specification refer to the Tire Inflation Pressure Chart provided with the vehicle.

Tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. Tire pressure should be checked cold once a month. The spare tire pressure should be checked at least twice annually. Tire pressure decreases as the ambient temperature drops. Check tire pressure frequently when ambient temperature varies widely.

Inflation pressures specified on the placards are cold inflation pressure. The vehicle must sit for at least 3 hours to obtain the correct cold inflation pressure reading. Or driven less than one mile after sitting for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation, due to increased tire temperature.

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND TREAD WEAR. THIS MAY CAUSE THE TIRE TO FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.

TIRE PRESSURE FOR HIGH SPEED

DESCRIPTION

Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very important. For speeds up to and including 120 km/h (75 mph), tires must be inflated to the pressures shown on the tire placard. For continuous speeds in excess of 120 km/h (75 mph), tires must be inflated to the maximum pressure specified on the tire sidewall.

Vehicles loaded to the maximum capacity should not be driven at continuous speeds above 75 mph (120 km/h).

For emergency vehicles that are driven at speeds over 90 mph (144 km/h), special high speed tires must be used. Consult tire manufacturer for correct inflation pressure recommendations.

REPLACEMENT TIRES

DESCRIPTION

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise

- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

DIAGNOSIS AND TESTING

PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 4).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 5).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 5).

TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying

DIAGNOSIS AND TESTING (Continued)

**Fig. 4 Tread Wear Indicators**

- 1 - THREAD ACCEPTABLE
 2 - THREAD UNACCEPTABLE
 3 - WEAR INDICATOR

patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is (Fig. 6). Other rotation methods can be used, but they will not provide all the tire longevity benefits.

**Fig. 6 Tire Rotation Pattern**

8031e864

speeds. Note the noise level during acceleration, deceleration and slight left and right steering inputs.

SERVICE PROCEDURES

ROTATION

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear

MATCH MOUNTING

Tires and wheels are currently match mounted at the factory. Match mounting is a technique used to reduce runout in the wheel/tire assembly. This means that the high spot of the tire is aligned with the low spot on the wheel rim. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the rim is identified with a label on the outside of the rim and a dot on the inside of the rim. If the outside label has been removed the tire will have to be removed to locate the dot on the inside of the rim.

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR

*HAVE TIRE INSPECTED FOR FURTHER USE.

RN797

Fig. 5 Tire Wear Patterns

SERVICE PROCEDURES (Continued)

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

(1) Use a dial indicator to locate the high spot of the tire on the center tread rib (Fig. 7). Record the indicator reading and mark the high spot on the tire. Place a mark on the tire at the valve stem location (Fig. 8).

PR1951A

Fig. 7 Dial Indicator

J9322-3

Fig. 8 First Measurement On Tire

- 1 - REFERENCE MARK
- 2 - 1ST MEASUREMENT
HIGH SPOT MARK TIRE AND RIM
- 3 - WHEEL
- 4 - VALVE STEM

(2) Break down the tire and remount it 180 degrees on the rim (Fig. 9).

J9322-4

Fig. 9 Remount Tire 180 Degrees

- 1 - VALVE STEM
- 2 - REFERENCE MARK

(3) Measure the total runout again and mark the tire to indicate the high spot.

(4) If runout is still excessive use the following procedures.

(a) If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.

(b) If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications. Refer to Wheel and Tire Runout.

(c) If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot to first. Break down the tire and remount it 90 degrees on rim in that direction (Fig. 10). This procedure will normally reduce the runout to an acceptable amount.

REPAIRING LEAKS

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 11). The tire should be replaced if the puncture is located in the sidewall.

SERVICE PROCEDURES (Continued)

J9322-5

Fig. 10 Remount Tire 90 Degrees In Direction of Arrow

- 1 - 2ND HIGH SPOT ON TIRE
2 - 1ST HIGH SPOT ON TIRE

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification.

CLEANING AND INSPECTION

CLEANING TIRES

Remove the protective coating on the tires before delivery of a vehicle. This coating may cause deterioration of the tires.

J8922-6

Fig. 11 Tire Repair Area

- 1 - REPAIRABLE AREA

To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

NOTE: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

TIRE AND WHEEL RUNOUT	7	TORQUE CHART	11

DESCRIPTION AND OPERATION

WHEEL

DESCRIPTION

The rim size is on the vehicle safety certification label located on the drivers door shut face. The size of the rim is determined by the drivetrain package. Original equipment wheels/rims are designed for operation up to the specified maximum vehicle capacity.

All models use stamped steel, cast aluminum or forged aluminum wheels. Every wheel has raised sections between the rim flanges and rim drop well called safety humps (Fig. 1).

Fig. 1 Safety Rim

- 1 - FLANGE
- 2 - RIDGE
- 3 - WELL

Initial inflation of the tire forces the bead over these raised sections. In case of rapid loss of air pres-

sure, the raised sections help hold the tire on the wheel.

The wheel studs and nuts are designed for specific applications. All aluminum and some steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels. Do not use replacement studs or nuts with a different design or lesser quality.

DIAGNOSIS AND TESTING

WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

TIRE AND WHEEL RUNOUT

Radial runout is the difference between the high and low points on the tire or wheel (Fig. 2).

Lateral runout is the **wobble** of the tire or wheel.

DIAGNOSIS AND TESTING (Continued)

J9022-4

Fig. 2 Checking Tire/Wheel/Hub Runout

- 1 - RADIAL RUNOUT
2 - LATERAL RUNOUT

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

METHOD 1 (RELOCATE WHEEL ON HUB)

(1) Drive vehicle a short distance to eliminate tire flat spotting from a parked position.

(2) Check wheel bearings and adjust if adjustable or replace if necessary.

(3) Check the wheel mounting surface.

(4) Relocate wheel on the mounting, two studs over from the original position.

(5) Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.

(6) Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

METHOD 2 (RELOCATE TIRE ON WHEEL)

NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

(1) Remove tire from wheel and mount wheel on service dynamic balance machine.

(2) Check wheel radial runout (Fig. 3) and lateral runout (Fig. 4).

• **STEEL WHEELS:** Radial runout 0.040 in., Lateral runout 0.045 in. (maximum)

• **ALUMINUM WHEELS:** Radial runout 0.030 in., Lateral runout 0.035 in. (maximum)

(3) If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout, Refer to match mounting procedure.

80a611da

Fig. 3 Radial Runout

- 1 - MOUNTING CONE
2 - SPINDLE SHAFT
3 - WING NUT
4 - PLASTIC CUP
5 - DIAL INDICATOR
6 - WHEEL
7 - DIAL INDICATOR

SERVICE PROCEDURES**WHEEL INSTALLATION**

The wheel studs and nuts are designed for specific applications. They must be replaced with equivalent parts. Do not use replacement parts of lesser quality or a substitute design. All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

NOTE: Do not use chrome plated lug nuts with chrome plated wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in

SERVICE PROCEDURES (Continued)

- 5 - DIAL INDICATOR
- 6 - WHEEL
- 7 - DIAL INDICATOR

sequence to the proper torque specification (Fig. 5).
Never use oil or grease on studs or nuts.

**Fig. 5 Lug Nut Tightening Pattern****WHEEL REPLACEMENT**

Wheels must be replaced if they have:

- Excessive runout
- Bent or dented

- Leak air through welds
- Have damaged bolt holes

Wheel repairs employing hammering, heating, or welding are not allowed.

Original equipment wheels are available through your dealer. Replacement wheels from any other source should be equivalent in:

- Load carrying capacity
- Diameter
- Width
- Offset
- Mounting configuration

Failure to use equivalent replacement wheels may affect the safety and handling of your vehicle. Replacement with **used** wheels is not recommended. Their service history may have included severe treatment.

TIRE AND WHEEL BALANCE

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

NOTE: Static should be used only when a two plane balancer is not available.

NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

For static balancing, find location of heavy spot causing the imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 6).

For dynamic balancing, the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (Fig. 7).

DESCRIPTION AND OPERATION	
BODY COMPONENTS	1

DESCRIPTION AND OPERATION

BODY COMPONENTS

PAINT

DESCRIPTION

The original equipment finish is a multi-step process that involves cleaning, electrodeposition (e-coat), base coat, and clear coat steps. Additionally, selected areas of the vehicle may be coated with an anti-chip finish.

OPERATION

On most vehicles a two-stage paint application (base coat/clear coat) is used. Color that is applied to primer is called base coat. The clear coat protects the base coat from ultraviolet light and provides a durable high-gloss finish.

STATIONARY GLASS

DESCRIPTION

Windshields and selected stationary glass are structural members of the vehicle. The windshield glass is bonded to the windshield frame with urethane adhesive.

OPERATION

Windshields are made of two pieces of glass with a plastic inner layer. Windshields and other stationary glass protect the occupants from the effects of the

elements. Windshields are also used to retain some airbags in position during deployment. Urethane bonded glass is difficult to salvage during removal. The urethane bonding is difficult to cut or clean from any surface. Before removing the glass, check the availability of replacement components.

SEATS

DESCRIPTION

Seat modules are made up of a seat frame, seat cushion, seat back cushion, a covering material, and the electrical components used for power operation, if equipped. Some seat systems also contain seat belt components and supplemental restraint systems.

OPERATION

Seat assemblies transport the occupants in comfort and safety. Seat assemblies also help position occupants correctly in the event of airbag deployment. Seat cushions, coverings, and electrical components are serviceable. Refer to the appropriate group in this manual.

EXTERIOR COMPONENTS

DESCRIPTION

Exterior sheet metal components make up the exterior of the vehicle. Some exterior metal systems are welded assemblies, such as doors and hoods. Some exterior trim items are made of composite.

DESCRIPTION AND OPERATION (Continued)

OPERATION

The exterior is finished in various metal stampings and composite moldings. These assemblies give the vehicle a finished appearance and protect the occupants from the elements. Some components are part of the energy absorbing system used to protect the occupants in collisions. The exterior sheet metal is repairable and adjustable for fit and finish. Welded

component systems are adjustable as a system. Trim components made of composite are stamped with the type of material used. DaimlerChrysler uses various fasteners to retain trim items. At times, it is not possible to remove trim items without damaging the fastener. If it is not possible to remove an item without damaging a component, cut or break the fasteners and use new ones when installing the component.

SAFETY PRECAUTIONS

TABLE OF CONTENTS

page

SERVICE PROCEDURES

SAFETY PRECAUTIONS AND WARNINGS 3

SERVICE PROCEDURES

SAFETY PRECAUTIONS AND WARNINGS

DESCRIPTION

WARNING: USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.

Always have a fire extinguisher ready for use when welding.

Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.

Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.

Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

DaimlerChrysler Corporation uses many different types of push-in fasteners to secure the interior and exterior trim to the body. Most of these fasteners can be reused to assemble the trim during various repair procedures. At times, a push-in fastener cannot be removed without damaging the fastener or the component it is holding. If it is not possible to remove a fastener without damaging a component or body, cut or break the fastener and use a new one when installing the component. Never pry or pound on a plastic or pressed-board trim component. Using a suitable fork-type prying device, pry the fastener from the retaining hole behind the component being removed. When installing, verify fastener alignment with the retaining hole by hand. Push directly on or over the fastener until it seats. Apply a low-force pull to the panel to verify that it is secure.

When it is necessary to remove components to service another, it should not be necessary to apply excessive force or bend a component to remove it. Before damaging a trim component, verify hidden fasteners or captured edges holding the component in place.

DESCRIPTION AND OPERATION		PAINTED SURFACE TOUCH-UP	4
PAINT CODE	4	SPECIFICATIONS	
BASE COAT/CLEAR COAT FINISH.	4	AFTERMARKET PAINT REPAIR PRODUCTS	5
FINESSE SANDING, BUFFING, AND			
POLISHING.	4		

DESCRIPTION AND OPERATION

PAINT CODE

The paint code is identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers.

BASE COAT/CLEAR COAT FINISH

DESCRIPTION

On most vehicles a two-part paint application (base coat/clear coat) is used. Color paint that is applied to primer is called base coat. The clear coat protects the base coat from ultraviolet light and provides a durable high-gloss finish.

CAUTION: Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

FINESSE SANDING, BUFFING, AND POLISHING

DESCRIPTION

Minor acid etching, orange peel, or smudging in clear coat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clear coat finish, if equipped. Base coat paint must retain clear coat for durability.

PAINTED SURFACE TOUCH-UP

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat. Refer to Introduction group of this manual for Body Code Plate information.

WARNING: USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

OPERATION

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the defect without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.

(5) On vehicles without clear coat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clear coat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

DESCRIPTION AND OPERATION (Continued)

WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

DESCRIPTION AND OPERATION

WINDSHIELD SAFETY PRECAUTIONS

DESCRIPTION

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT.

URETHANE ADHESIVES ARE APPLIED AS A SYSTEM. USE GLASS CLEANER, GLASS PREP SOLVENT, GLASS PRIMER, PVC (VINYL) PRIMER AND PINCH WELD (FENCE) PRIMER PROVIDED BY THE ADHESIVE MANUFACTURER. IF NOT, STRUCTURAL INTEGRITY COULD BE COMPROMISED.

DAIMLERCHRYSLER DOES NOT RECOMMEND GLASS ADHESIVE BY BRAND. TECHNICIANS SHOULD REVIEW PRODUCT LABELS AND TECHNICAL DATA SHEETS, AND USE ONLY ADHESIVES THAT THEIR MANUFACTURES WARRANT WILL RESTORE A VEHICLE TO THE REQUIREMENTS OF FMVSS 212. TECHNICIANS SHOULD ALSO INSURE THAT PRIMERS AND CLEANERS ARE COMPATIBLE WITH THE PARTICULAR ADHESIVE USED.

BE SURE TO REFER TO THE URETHANE MANUFACTURER’S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

VAPORS THAT ARE EMITTED FROM THE URETHANE ADHESIVE OR PRIMER COULD CAUSE PERSONAL INJURY. USE THEM IN A WELL-VENTILATED AREA.

SKIN CONTACT WITH URETHANE ADHESIVE SHOULD BE AVOIDED. PERSONAL INJURY MAY RESULT.

ALWAYS WEAR EYE AND HAND PROTECTION WHEN WORKING WITH GLASS.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

OPERATION

The windshield is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the moldings are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and moldings from the parts supplier.

REMOVAL AND INSTALLATION

WINDSHIELD

The windshield is positioned in the reveal molding and is bonded to the windshield frame with urethane adhesive.

Depending on the circumstances, either one of two windshield glass installation methods can be used:

- The short method.
- The extended method.

The short method is used when the windshield glass is removed intact, and the body opening and the pinchweld flanges do not require repair.

The extended method must be used when the body opening or a flange is damaged. The extended method must also be used when urethane no longer adheres to either the windshield glass or the pinchweld flanges.

REMOVAL

(1) Cover the interior and exterior body surface areas with a protective covering.

REMOVAL AND INSTALLATION (Continued)

(2) Remove the windshield wiper arms and the rearview mirror.

(3) Using a razor knife, slide the blade between the windshield glass and the inboard edge of the reveal molding.

(4) Cut around the interior perimeter of the reveal molding and sever the cap of the reveal molding.

(5) Using a cold knife, cut the urethane around the perimeter of the windshield (Fig. 1).

(6) Remove the windshield glass from the frame.

Fig. 1 Cutting Urethane Around Windshield—Typical

1 - WINDSHIELD
2 - COLD KNIFE

INSTALLATION—SHORT METHOD

WARNING: REVIEW ALL WARNINGS AND CAUTIONS IN THIS GROUP BEFORE PRECEDING WITH INSTALLATION.

(1) Trim the urethane from the pinchweld flanges. Leave a 3 mm (0.1 in.) level base of urethane on the pinchweld flanges.

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN WINDSHIELD BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

(2) Clean inside of windshield with ammonia based glass cleaner and lint-free cloth.

(3) Prime outer perimeter of interior side of glass 16 mm (5/8 inch) from edge. Use a wipe-off type urethane primer and wipe glass dry after primer application.

NOTE: The reveal molding has an adhesive applied to the windshield contact surface to help secure the molding to the windshield during the installation procedure.

(4) Apply the molding to the windshield:

- With the molding at room temperature, press the molding onto the windshield corners.

- From corner to corner, work the molding to the center of each side. (Some stretching of the molding may be required during this procedure.)

(5) Place the glass on the pinchweld flanges and inspect for gaps in the urethane. Gaps in excess of 3 mm (1/8 inch) must be filled with urethane.

(6) Adjust windshield glass position until it is aligned with the flanges and adhesive.

(7) Using a grease pencil or equivalent, make alignment marks on the glass and body.

(8) Remove replacement windshield from windshield opening.

(9) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 2).

CAUTION: Avoid spilling or dripping primer on painted surfaces. Clean spills or drips immediately. The primer will damage the paint if it remains on the surface for any length of time.

(10) If the replacement windshield glass does not have blackout primer:

- Attach a 25 mm (1 in) wide masking tape band around the interior side of the glass 16 mm (5/8 in) from the edge of the glass (Fig. 3).

- Do not attach tape along the bottom of the glass and **attach it only to the inside of the glass.**

- Clean the 16-mm (5/8-in) wide surface area around the glass with isopropyl alcohol.

- Thoroughly mix and apply glass blackout primer to the 16 mm (5/8 in) surface area around the interior side of the glass (Fig. 4).

- Allow the primer to dry for at least 10-12 minutes.

(11) Apply a small amount of adhesive to the bottom support spacers and attach the support spacers to the bottom of the windshield, 170 mm inboard from the outer windshield edge (Fig. 5).

(12) Cut the urethane adhesive applicator nozzle (Fig. 6).

CAUTION: Be prepared to install the glass immediately after applying the adhesive, as the adhesive will begin to cure in less than 10 minutes.

(13) Apply a continuous, 6-mm (1/4-in) diameter bead of urethane adhesive to the surface area.

(14) Align the glass with the reference marks and position the glass on the pinchweld flanges. Ensure that the windshield glass is correctly seated on the support spacers.

REMOVAL AND INSTALLATION (Continued)

(15) Force the windshield glass inward just enough to wet-out and set the urethane. Use care to avoid excessive squeeze-out of adhesive.

(16) Water test the windshield with a water spray after installation. Do not direct high pressure streams of water directly at urethane. If any leaks are detected, apply urethane as necessary.

(17) If used, remove the masking tape from the inner surface of the glass.

(18) Install all components and clean the vehicle.

(19) Open the vehicle windows to prevent interior pressure while the urethane is curing. **If not vented, pressure in the interior of the vehicle may interfere with proper glass bonding.**

(20) Install the rearview mirror.

80a28c10

- 3 - SUPPORT SPACER
- 4 - COWL
- 5 - MOLDING

(1) Remove the all of urethane from all pinchweld flanges.

REMOVAL AND INSTALLATION (Continued)

**Fig. 6 Applicator Nozzle Preparation**

- 1 – CUT NOZZLE THIS SHAPE FOR EXTENDED PROCEDURE
 2 – CUT NOZZLE THIS SHAPE FOR SHORT PROCEDURE

(2) Inspect and repair the windshield opening and pinchweld flanges.

(3) Prime the pinchweld flanges with a urethane base primer. However, if the flange is color-coated with paint, prime the flanges with a paint finish primer. **This is important because urethane adhesive will not adhere to all color-coat paints.** Allow primer sufficient time to dry.

NOTE: The reveal molding has an adhesive applied to the windshield contact surface to help secure the molding to the windshield during the installation procedure.

(4) Apply the reveal molding to the windshield:

- With the molding at room temperature, press the molding onto the windshield corners.
- From corner to corner, work the molding to the center of each side. (Some stretching of the molding may be required during this procedure).

(5) Install and inspect the fit of the windshield on the pinchweld flanges as follows:

- Position windshield until it is aligned within windshield opening.
- Measure the gap between the pinchweld flanges and glass around perimeter of the glass and flange.
- The reveal molding should equally cover the A-Pillars on both sides.
- The flanges should also extend above the glass edge equally around the perimeter of the opening.

(6) If the pinchweld flanges require repair, remove the windshield glass and straighten, align, or repair the flange(s) as necessary.

(7) Position the windshield in the opening and inspect the windshield fit again. Mark the windshield final position on the glass and body with a wax pencil (or use masking tape). The marks (or masking

tape) will be used for installation alignment reference.

(8) If the replacement windshield does not have blackout primer:

- Attach a 25-mm (1-in) wide masking tape band around the interior side of glass 16 mm (5/8 in) from edge of glass (Fig. 3).
- Do not attach tape along the bottom of the glass and **attach only to the inside of glass.**
- Thoroughly mix and apply blackout primer to the 16 mm (5/8 in) surface area around the interior side of the glass (Fig. 4).
- Allow the primer to dry for at least 10-12 minutes.

(9) Apply a small amount of adhesive to the bottom support spacers and attach the support spacers to the bottom of the windshield, 170 mm inboard from the outer windshield edge (Fig. 5).

(10) Cut the urethane applicator nozzle (Fig. 6).

(11) Apply a continuous bead of urethane to the surface area with blackout primer on the interior side of glass. The bead should be 9-mm (3/8-in) wide by 12.7-mm (1/2-in) deep for best results.

CAUTION: Be prepared to install the glass immediately after applying the adhesive, as the adhesive will begin to cure in less than 10 minutes.

(12) Align the windshield with the wax pencil installation alignment reference marks (or the tape strips). Position the windshield on pinchweld flanges and spacers.

(13) Force the windshield inward just enough to wet-out and set the urethane. Use care to avoid excessive squeeze-out of adhesive.

(14) Water test the windshield with a water spray after installation. Do not direct high pressure streams of water directly at the urethane. If any leaks are detected, apply urethane as necessary.

(15) If used, remove the masking tape from the inner surface of glass.

(16) Install all components and clean the vehicle. If necessary, refer to the installation procedures.

(17) Open the vehicle windows to prevent interior pressure while the urethane adhesive is curing. **If not vented, pressure in the interior of vehicle will interfere with glass bonding.**

(18) Install the rearview mirror on the bracket.

REAR DOOR STATIONARY WINDOW GLASS

REMOVAL

The rear door stationary window glass is bonded to the division bar and is serviced as an assembly.

- (1) Lower the window glass.
- (2) Remove the inner and outer beltline weather-strip.

REMOVAL AND INSTALLATION (Continued)

(3) Remove the trim panel and waterdam from door inner panel.

(4) Remove the screws attaching the division bar/glass to the door (Fig. 7).

(5) Tilt the division bar/glass forward and remove it from the door.

80ac2bd7

Fig. 7 Division Bar/Stationary Glass

- 1 - UPPER SCREW
- 2 - GLASS
- 3 - LOWER SCREW
- 4 - DIVISION BAR

INSTALLATION

- (1) Position the division bar/glass in the door.
- (2) Install the screws attaching the division bar/glass to the door. Finger tighten the screws.
- (3) Tighten the upper screw to 6 N·m (5 ft-lbs) torque.
- (4) Tighten the lower screw to 6 N·m (5 ft-lbs) torque.
- (5) Install the beltline weatherstrip.
- (6) Install the door waterdam and trim panel.

REAR QUARTER WINDOW GLASS

REMOVAL

- (1) If equipped, remove the quarter window reveal molding (Fig. 8).
- (2) Remove the quarter window interior trim covers.
- (3) Separate the weatherstrip seal lip from the window opening flanges. Use a pry tool and carefully push the window glass and seal outward.
- (4) Remove the weatherstrip seal and window glass from window opening.
- (5) Remove the weatherstrip seal from the window glass.

J9123-54

Fig. 8 Quarter Window Reveal Molding, Glass and Seal

- 1 - GLASS
- 2 - REVEAL MOULDING
- 3 - WEATHERSTRIP SEAL

INSTALLATION

- (1) Clean the original sealant from the weatherstrip channels and window opening flanges.
- (2) Apply a 4-mm (1/6-in) diameter bead of sealant to the window channel in the weatherstrip seal.
- (3) Install the weatherstrip on the window glass. Install the seal installation cord in the window opening flange channel (Fig. 9) as follows:
 - Moisten a length of 6-mm (1/4-in) diameter cord with a soap and water solution.
 - Ensure that the cord is long enough to go all the way around the perimeter of the weatherstrip.
 - Insert the cord into the window opening flange channel in the weatherstrip seal.
- (4) Apply a 6-mm (1/4-in) diameter bead of sealant to the window opening flanges.
- (5) For two-door vehicles, apply a 3-mm (1/8-in) diameter bead of sealant at the quarter panel applique and liftgate pillar seam.
- (6) Position the quarter window glass and the weatherstrip seal in the window opening (Fig. 10) with the free ends of the cord inside the vehicle (Fig. 11).
- (7) Pull on each end of the cord to pull the weatherstrip seal channel lip over the window opening flanges.
- (8) Test the vent window for water leaks.
- (9) Install the interior trim cover.
- (10) If equipped, install the quarter window reveal molding.

REMOVAL AND INSTALLATION (Continued)

LIFTGATE GLASS

REMOVAL

- (1) Open liftgate.
- (2) Remove liftgate trim panel.
- (3) Disconnect heated backlite (HBL) connector.
- (4) Remove wiper arm.
- (5) Remove CHMSL lens.
- (6) Using a razor knife, slide the blade between the liftgate glass and the inboard edge of the reveal molding.
- (7) Cut around the interior perimeter of the reveal molding and sever the cap of the reveal molding.

J8923-83

Fig. 11 Quarter Window Glass and Seal Installation

- 1 - WEATHERSTRIP
- 2 - 1/4-INCH DIAMETER CORD (POSITION IN WEATHERSTRIP GLASS CHANNEL)

(8) Using a cold knife, cut urethane bonding from around liftgate glass. A pneumatic cutting device can be used if available.

(9) Separate glass from Liftgate.

INSTALLATION

CAUTION: Open a window before installing glass. This will avoid pressurizing the passenger compartment. If a door or liftgate is slammed before urethane is cured, water leaks can result.

(1) Trim the urethane from the liftgate glass opening flanges. Leave a 3 mm (0.1 in.) level base of urethane on the flanges.

(2) Starting in the corners, press reveal molding onto glass.

(3) Place replacement glass into liftgate opening and position glass in the center of the opening against flange.

(4) Verify the glass lays evenly against the fence at the sides, top and bottom. If not, the flange must be formed to the shape of the new glass.

(5) Using a grease pencil or equivalent, make references marks on the glass and body.

(6) Remove replacement glass from liftgate opening.

(7) Position the glass inside up on a suitable work surface.

REMOVAL AND INSTALLATION (Continued)

WARNING: DO NOT USE SOLVENT BASED GLASS CLEANER TO CLEAN WINDSHIELD BEFORE APPLYING GLASS PREP AND PRIMER. POOR ADHESION CAN RESULT.

(8) Clean inside of glass with Mopar Glass Cleaner and lint-free cloth.

(9) Apply PVC (vinyl) primer 25 mm (1 in.) wide around edge of glass. Wipe with clean/dry lint-free cloth.

(10) If necessary, apply fence primer around edge of fence. Allow at least eighteen minutes drying time.

(11) Apply a 10 mm (0.4 in.) bead of urethane around glass border.

(12) Position glass into liftgate opening and reference marks.

(13) Push the glass inward until the reveal molding is seated onto the liftgate frame. Use care to avoid excessive squeeze-out of adhesive.

(14) Open windows to prevent pressure build-up while the urethane is curing.

(15) Apply 150 mm (6 in.) lengths of 50 mm (2 in.) masking tape spaced 250 mm (10 in.) apart to hold glass in place until urethane cures.

(16) Install the wiper arm.

(17) Install CHMSL lens.

(18) Connect heated backlite (HBL) connector.

(19) After urethane has cured, remove tape strips and water test to verify repair.

(20) Install liftgate trim panel.

REMOVAL AND INSTALLATION

HEAD RESTRAINT SLEEVE

REMOVAL

NOTE: When replacing a head restraint sleeve, the retaining tabs on the sleeve will be damaged during the removal process. Check the availability of replacement parts before servicing.

- (1) Raise head restraint to the full up position.
- (2) Turn head restraint lock thumbwheel to release head restraint and pull head restraint upward to remove from seat back.
- (3) Insert head restraint sleeve extractor (special tool 6773) (Fig. 1) and (Fig. 2) into the seat back.
- (4) The retaining tabs are positioned on each side of the sleeve, when inserting the extractor, ensure that the flat of the collar is facing the side of the seatback (Fig. 3).
- (5) Using a small hammer, tap extractor downward to release sleeve retaining tab.
- (6) Remove extractor tool from sleeve, rotate tool 180 degrees (Fig. 4) and repeat steps 3 and 4.

- (7) Remove extractor tool from sleeve and remove sleeve from seat back.

**Fig. 3 Head Restraint Sleeve Extractor Positioning**

- 1 - EXTRACTOR TOOL 6773
- 2 - SEAT BACK
- 3 - LOCK RELEASE THUMBWHEEL

INSTALLATION

- (1) Position the sleeve in the seat back.
- (2) Firmly, push sleeve down to snap into place.
- (3) Install head restraint.

HEAD RESTRAINT COVER**REMOVAL**

- (1) Remove head restraint from the bucket seat.
- (2) Remove the screws attaching the bezel and adjuster bar to the head restraint (Fig. 5).
- (3) Pull the adjuster bar from the head restraint.
- (4) Roll the cover upward and separate from the head restraint cushion (Fig. 6).

**Fig. 5 Head Restraint**

- 1 - HEAD RESTRAINT
- 2 - BEZEL
- 3 - ADJUSTER BAR

INSTALLATION

- (1) Position the cover on the head restraint cushion and roll the cover downward.
- (2) Position the adjuster bar in the head restraint.
- (3) Install the screws attaching the bezel and adjuster bar to the head restraint.
- (4) Install head restraint in the bucket seat.

REMOVAL AND INSTALLATION (Continued)

Fig. 6 Head Restraint Cover

- 1 – HEAD RESTRAINT COVER
2 – HEAD RESTRAINT CUSHION

BUCKET SEAT

REMOVAL

- (1) Remove bolts attaching seat to floor pan (Fig. 7).
- (2) Remove nut attaching seat to floor pan.
- (3) For power seat, disconnect wire harness connector. If equipped, disconnect wire harness for heated seat.
- (4) Disconnect seat belt buckle warning wire harness connector.
- (5) Separate seat from floor panel.

INSTALLATION

- (1) Position seat on floor pan.
- (2) Connect seat belt buckle warning wire harness connector.
- (3) For power seats, connect wire harness connector. If equipped, connect harness for heated seat.
- (4) Install front fasteners attaching seat to floor pan. Tighten to 27 N·m (20 ft. lbs.) torque.
- (5) Install rear fasteners attaching seat to floor pan. Tighten to 27 N·m (20 ft. lbs.) torque.
- (6) Install nut attaching seat to floor pan. Tighten to 40 N·m (30 ft. lbs.) torque.

BUCKET SEAT TRACK

REMOVAL

NOTE: If the vehicle is equipped with manually adjusted bucket seats, the inboard or outboard seat track may be serviced separately.

- (1) Remove bucket seat from vehicle.
- (2) Remove screws attaching the side shield trim cover from the seat.

Fig. 7 Bucket Seat—Power Seat

- 1 – NUT
2 – DRIVER SIDE FRONT SEAT
3 – SCREW
4 – STUD
5 – SCREW

- (3) If equipped, disengage the power seat connector from the power seat switch.

- (4) Remove the nuts attaching the seat track to the bucket seat platform.

- (5) When separating the seat track from the platform, route the power seat switch connector through the access hole in the seat cushion frame, if equipped.

INSTALLATION

- (1) While positioning the seat track on the bucket seat platform, route the power seat switch connector through the access hole in the seat cushion frame, if equipped.

- (2) Install the nuts attaching the seat track to the bucket seat platform.

- (3) If equipped, engage the power seat connector to the power seat switch.

- (4) Install screws attaching the side shield trim cover to the seat.

- (5) Install bucket seat.

BUCKET SEAT PLATFORM

Bucket seat platforms are not repairable. If the seat platform is damaged, replace platform as a unit.

REMOVAL AND INSTALLATION (Continued)

BUCKET SEATBACK COVER

REMOVAL

- (1) Remove seat.
- (2) Remove head restraint, if equipped.
- (3) Remove screws attaching side shield trim cover to bucket seat.
- (4) If equipped, disengage power seat wire connector from power seat switch.
- (5) Remove the inboard seatback pivot bolt and large plastic washer.
- (6) Position the seatback in the full forward or full recline position.
- (7) Remove the seatback cover J straps from the base of the seatback.
- (8) Roll the seatback cover upward, disengage electrical connectors for heated seat grid, if equipped. (Fig. 8).
- (9) Disengage the hogrings attaching the seatback cover to the seatback cushion support wires (Fig. 9).
- (10) Roll the seatback cover upward and disengage the hook and loop fastener (Fig. 10).
- (11) Roll seatback cover up and over the head restraint sleeves, if equipped and separate from the seatback.

80aafb05

Fig. 8 Seatback Cover

- 1 - SEAT BACK COVER
2 - SEAT BACK CUSHION

INSTALLATION

- (1) Position the seatback cover on the seatback cushion and roll seatback cover down over the head restraint sleeves. Route the sleeves through the access holes in the cover, if equipped.
- (2) Roll the seatback cover downward and engage the hook and loop fastener. Engage electrical connectors for heated seat grid, if equipped.
- (3) Continue rolling the cover downward and engage the hogrings attaching the seatback cover to the seatback cushion support wires.

80aafb04

Fig. 9 Hog Ring

3 - SEAT BACK CUSHION

- (4) Engage the seatback cover J straps to the base of the seatback.
- (5) Install the inboard seatback pivot bolt and large plastic washer.
- (6) Install the side shield trim cover.
- (7) Install head restraint, if equipped.
- (8) Install seat.

BUCKET SEATBACK

REMOVAL

- (1) Remove seat.
- (2) Remove side shield trim cover.
- (3) Remove inboard seatback pivot bolt and washer.

REMOVAL AND INSTALLATION (Continued)

- (4) Remove bolts attaching recliner to seat cushion frame (Fig. 11).
- (5) Separate seatback from vehicle.

Fig. 11 Bucket Seatback

- 1 - SEAT BACK
2 - RECLINER
3 - SEAT CUSHION

INSTALLATION

- (1) Position seatback on seat cushion frame.
- (2) Install inboard seatback pivot bolt and washer.
- (3) Install bolts attaching recliner to seat cushion frame.
- (4) Install side shield trim cover.
- (5) Install seat.

BUCKET SEAT CUSHION COVER

REMOVAL

- (1) Remove seat from vehicle.
- (2) Remove side shield trim cover.
- (3) Remove seatback.
- (4) With the cushion side down, disengage the forward, rearward and inboard J-straps.
- (5) Disengage the clips attaching the outboard side of the cover to the cushion frame.
- (6) Turn the cushion over and roll the cover off the cushion.
- (7) Disengage the electrical connectors for the heated seat, if equipped.
- (8) Remove the hog rings attaching the cover to the cushion support wires (Fig. 12).
- (9) Separate the cover from the cushion.

INSTALLATION

- (1) Position the cover on the cushion.
- (2) Engage the electrical connectors for the heated seat, if equipped.
- (3) Install the hog rings attaching the cover to the cushion support wires.

Fig. 12 Seat Cushion Cover Hog Rings

- 1 - SEAT CUSHION COVER
2 - SEAT CUSHION
3 - HOG RING

- (4) With the cushion side down, engage the forward, rearward and inboard J-straps.

- (5) Engage the clips attaching the outboard side of the cover to the cushion frame.

- (6) Install seatback.
- (7) Install side shield trim cover.
- (8) Install seat.

BUCKET SEAT RECLINER

REMOVAL

- (1) Remove side shield trim cover.
- (2) Disengage seatback cover zipper.
- (3) Roll outer seatback cover upward.
- (4) Remove bolts attaching recliner to seatback and seat cushion frames (Fig. 13).
- (5) Separate recliner from seat.

INSTALLATION

- (1) Position recliner on seat.
- (2) Install bolts attaching recliner to seatback and seat cushion frames (Fig. 13).
- (3) Roll seatback cover downward.
- (4) Engage seatback cover zipper.
- (5) Install side shield trim cover.

REAR SEAT CUSHION

REMOVAL

- (1) Disengage seat cushion at rear by pulling upward on release strap (Fig. 14).
- (2) Tilt seat cushion forward.
- (3) Disengage seat cushion latch with right side release lever. Separate right side latch and left side seat bracket from floor anchor bolts, and remove cushion from vehicle (Fig. 15).

REMOVAL AND INSTALLATION (Continued)

**Fig. 13 Bucket Seat Recliner**

- 5 - GROMMET
- 6 - SEAT CUSHION
- 7 - BUSHING

**Fig. 14 Seat Cushion Release Strap**

- 1 - REAR SEAT CUSHION
- 2 - RELEASE STRAP

INSTALLATION

- (1) Position seat cushion in vehicle.
- (2) Insert left pivot in anchor grommet.
- (3) Force right side latch onto anchor bolt and pivot seat cushion to horizontal position.
- (4) Lock seat cushion in-place by pressing firmly on center of cushion until latch engages.

REAR SEATBACK**REMOVAL**

- (1) Disengage the seat cushion at the rear by pulling upward on the release strap.
- (2) Tilt the seat cushion forward.
- (3) Remove the shoulder/lap belt buckles from the elastic straps.
- (4) Release the seatback latch from the striker.
- (5) Remove the pivot bolts and the washers from the wheelhouse panel anchors (Fig. 15).
- (6) Tilt the seatback forward, lift it upward and remove it from the vehicle.

INSTALLATION

- (1) Position the seatback in the vehicle.
- (2) Install the pivot bolts and the washer. Tighten the bolts with 33 N·m (25 ft. lbs.) torque.
- (3) Engage the seatback latch with the striker.
- (4) Insert the shoulder/lap belt buckles in the elastic straps.
- (5) Pivot the seat cushion to the horizontal position and lock it in-place by pressing firmly on the center of the cushion until the latch engages.

REMOVAL AND INSTALLATION (Continued)

REAR SEAT CUSHION COVER

REMOVAL

- (1) Remove the seat cushion from the vehicle.
- (2) Remove the cover side, front and rear retaining clips from the wire retainers with an appropriate removal tool (Fig. 16).
- (3) Remove the serrated retainers from the front ends of the cover with a trim panel removal tool (Fig. 17).
- (4) Remove the seat cover from the cushion.

J8923-98

Fig. 16 Seat Cushion Cover Retaining Clip Removal

- 1 - REMOVER TOOL
2 - SEAT COVER

J8923-97

Fig. 17 Seat Cushion Cover Retaining Clip Removal

- 1 - CLIP REMOVER TOOL
2 - SEAT COVER CLIPS

INSTALLATION

- (1) Position the replacement cover on the cushion.
- (2) Compress the cover and attach the retaining clips to the front and rear wire retainers.
- (3) Install the serrated retainers at the ends of the cover.
- (4) Install the seat cushion in the vehicle. If necessary, refer to the installation procedure.

REAR SEATBACK LATCH STRIKER AND BUMPER

REMOVAL

- (1) Disengage seat cushion at the rear by pulling upward on the release strap.
- (2) Tilt seat cushion forward.
- (3) Release seatback latch from striker.
- (4) Tilt seatback forward for access to striker bracket.
- (5) Remove screws (Fig. 18) attaching latch striker bracket and shims to trim panel.

80b89834

Fig. 18 Seatback Latch Striker Bracket

- 1 - SEAT BACK LATCH STRIKER BRACKET
2 - SEAT BACK LATCH STRIKER
3 - SEAT BACK
4 - SEAT CUSHION

INSTALLATION

- (1) Position shims and latch striker bracket on trim panel.
- (2) Install screws attaching latch striker bracket and shims to trim panel. Tighten screws to 6 N·m (50 in. lbs.) torque.
- (3) Engage seatback latch with striker.

REMOVAL AND INSTALLATION (Continued)

(4) Pivot seat cushion to horizontal position and lock it in-place by pressing firmly on center of the cushion until latch engages.

REAR SEATBACK COVER**REMOVAL**

- (1) Remove the seatback from the vehicle.
- (2) Remove the seatback latch release handle and bezel from the seatback.
- (3) Disengage the cover zippers.
- (4) Disengage the J-strap attaching the cover to the seat back frame (Fig. 19).
- (5) Remove the cover from the seatback pad.

INSTALLATION

- (1) Install the cover on the seatback.
- (2) Attach the cover J-strap to the seatback frame.
- (3) Engage the cover zippers.
- (4) Install the seat latch release bezel and handle.
- (5) Install the seatback in the vehicle.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.

- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.

- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations refer to Group 0, Lubrication and Maintenance, General Information section.

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

DIAGNOSIS AND TESTING (Continued)

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

Wind noise can also be caused by improperly fitted exterior moldings or body ornamentation. Loose moldings can flutter, creating a buzzing or chattering noise. An open cavity or protruding edge can create a whistling or howling noise. Inspect the exterior of the vehicle to verify that these conditions do not exist.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

SERVICE PROCEDURES

BODY LUBRICATION

All mechanisms and linkages should be lubricated when necessary. This will maintain ease of operation and provide protection against rust and excessive wear. The weatherstrip seals should be lubricated to prolong their life as well as to improve door sealing.

All applicable exterior and interior vehicle operating mechanisms should be inspected and cleaned. Pivot/sliding contact areas on the mechanisms should then be lubricated.

(1) When necessary, lubricate the operating mechanisms with the specified lubricants.

(2) Apply silicone lubricant to a cloth and wipe it on door seals to avoid over-spray that can soil passenger's clothing.

(3) Before applying lubricant, the component should be wiped clean. After lubrication, any excess lubricant should be removed.

(4) The hood latch, latch release mechanism, latch striker, and safety latch should be lubricated periodically.

(5) The door lock cylinders should be lubricated twice each year (preferably autumn and spring).

- Spray a small amount of lock cylinder lubricant directly into the lock cylinder.
- Apply a small amount to the key and insert it into the lock cylinder.
- Rotate it to the locked position and then back to the unlocked position several times.
- Remove the key. Wipe the lubricant from it with a clean cloth to avoid soiling of clothing.

REMOVAL AND INSTALLATION

GRILLE

REMOVAL

- (1) Remove the headlamp/park lamp bezels.
- (2) Remove the screws attaching the grille to the grille opening panel (GOP) (Fig. 1).
- (3) Separate the grille from the GOP.

Fig. 1 Grille

- 1 - NUT
2 - GRILLE
3 - GRILLE OPENING PANEL

INSTALLATION

- (1) Position the grille in the GOP.
- (2) Install the screws.
- (3) Install the headlamp/park lamp bezels.

GRILLE OPENING PANEL (GOP)

REMOVAL

- (1) Remove headlamp bezels.
- (2) Remove grille.
- (3) Remove side marker lamps.
- (4) Remove headlamps and park/turn signal lamps.
- (5) Open hood.
- (6) Remove nuts that attach GOP to front fenders (Fig. 2).
- (7) Remove nuts attaching GOP to support bracket.
- (8) Pull GOP forward and disconnect harness clips and front lamp harness connectors.
- (9) Remove GOP from vehicle.

INSTALLATION

- (1) Place GOP on bumper and secure all harness clips.
- (2) Connect all lamp wire harness connectors.

80b8982b

Fig. 2 Grille Opening Panel

- 1 - SUPPORT BRACKET
2 - GRILLE OPENING PANEL
3 - BODY

- (3) Position GOP on vehicle.
- (4) Install nuts attaching GOP to front fenders. Tighten nuts to 4 N·m (38 in-lbs) torque.
- (5) Install nuts attaching GOP to support bracket. Tighten nuts to 4 N·m (38 in-lbs) torque.
- (6) Install headlamps and park/turn signal lamps.
- (7) Install grille.
- (8) Install side marker lamps.
- (9) Install headlamp bezels.
- (10) Adjust headlamp aim, if necessary.

HOOD

REMOVAL

- (1) Raise hood.
- (2) Disconnect underhood lamp wire harness connector, if equipped.
- (3) Disconnect release cable from latch release bellcrank.
- (4) Remove latch release cable clips and remove cable from hood (Fig. 3).
- (5) Mark location of hood, hinges and hinge shims for installation.
- (6) Remove bolts that attach hinges to hood.
- (7) Remove hood from vehicle with aid of a helper.

INSTALLATION

- (1) Position hood on shims and hinges; finger-tighten hinge bolts.
- (2) Align hinges and shims with reference marks and tighten hinge bolts.
- (3) Connect latch release cable and latch connecting rod to bellcrank.
- (4) Attach latch release cable to clips.
- (5) Connect underhood lamp wire harness connector.

Fig. 3 Hood Components

REMOVAL AND INSTALLATION (Continued)

HOOD HINGE

REMOVAL

- (1) Raise and support hood.
- (2) Using a grease pencil or equivalent, mark position of hood.
- (3) Remove seal from hinge base (Fig. 4).
- (4) Remove hinge retaining nuts from studs.

**Fig. 4 Hood Hinge and Seal**

- 1 - HINGE
- 2 - SEAL
- 3 - HINGE BASE
- 4 - DASH PANEL
- 5 - NUT
- 6 - HOOD

INSTALLATION

- (1) Position hinge over studs and align with reference marks.
- (2) Install nuts.

NOTE: If a replacement hinge seal is being installed, position it around hinge arm, force it against hinge base.

- (3) Position hinge seal around hinge arm and on hinge base.
- (4) Adjust hood as necessary.

HOOD LATCH

REMOVAL

- (1) Remove the screw that attaches the latch to the hood inner panel (Fig. 5).
- (2) Disconnect the latch connecting rod.
- (3) Remove the latch from the hood.

INSTALLATION

- (1) Connect the latch to the latch connecting rod and

80ab5cd8

Fig. 5 Hood Latch

- 1 - RETAINER CLIP
- 2 - LATCH CONNECTING ROD
- 3 - ROD SPRING
- 4 - HOOD LATCH
- 5 - HOOD

- (2) Position the latch on the hood inner panel.
- (3) Install the screw that attaches the latch to the hood inner panel.

HOOD LATCH STRIKER

REMOVAL

- (1) Remove headlamp bezel.
- (2) Remove parklamp.
- (3) Release the spring attaching the headlamp mounting bucket to the grille opening panel (GOP).
- (4) Remove the headlamp with mounting bucket attached from the adjusting screws.
- (5) Remove the upper bolt attaching the striker to the top of the (GOP).
- (6) Remove the lower bolt attaching the striker to the (GOP).
- (7) Remove the striker and shims.

INSTALLATION

- (1) Position the shims and striker on the (GOP) and install the bolts.
- (2) Install the headlamp and mounting bucket.
- (3) Install parklamp.
- (4) Install the headlamp bezel.
- (5) Test the striker/hood alignment by opening and closing the hood several times. Adjust the striker, if necessary.

REMOVAL AND INSTALLATION (Continued)

HOOD RELEASE CABLE

REMOVAL

- (1) Drill out bellcrank to hood rivet heads and remove rivets (Fig. 6).
- (2) Disconnect bellcrank from latch rod and hood release cable. Remove bellcrank from hood.
- (3) Disconnect hood release cable from clips on hood.
- (4) Remove left cowl side trim panel.
- (5) Remove cable bracket screws from cowl side panel.
- (6) Route cable through dash panel and remove it from under instrument panel.

Fig. 6 Hood Release Cable Bellcrank

- 1 - HOOD INNER PANEL
- 2 - RIVET
- 3 - BELLCRANK
- 4 - LATCH RELEASE CABLE
- 5 - LATCH CONNECTING ROD

INSTALLATION

- (1) Insert replacement cable end through hole in dash panel into engine compartment.
- (2) Route cable forward and seat grommet in dash panel.
- (3) Position cable bracket on cowl side panel and install screws.
- (4) Install left cowl side trim panel.
- (5) Connect cable and latch rod to bellcrank.
- (6) Position bellcrank on hood and install rivets.
- (7) Attach cable to clips.
- (8) Test release cable for proper operation.

HOOD SAFETY LATCH

REMOVAL

- (1) Open and support hood.

- (2) Remove the nuts attaching the safety latch to the inner hood panel (Fig. 7).
- (3) Separate the safety latch from the hood.

Fig. 7 Hood Safety Latch

- 1 - NUT
- 2 - HOOD SAFETY LATCH
- 3 - HOOD
- 4 - STUD
- 5 - HOOD BUMPER

INSTALLATION

- (1) Position the safety latch on the hood.
- (2) Install the nuts attaching the safety latch to the inner hood panel.
- (3) Close hood.

SAFETY LATCH STRIKER

REMOVAL

- (1) Remove striker screws from radiator support crossmember (Fig. 8).
- (2) Remove striker from crossmember.

INSTALLATION

- (1) Position striker on radiator support crossmember and install screws.
- (2) Test safety latch operation.

HOOD SILENCER PAD

REMOVAL

- (1) Open and support hood.
- (2) Remove the hood latch release bellcrank.
- (3) Remove the clips attaching the latch connecting rod to the hood inner panel.
- (4) Remove the retainers attaching the hood silencer pad to the inner hood panel (Fig. 9).
- (5) Separate the hood silencer pad from the hood.

REMOVAL AND INSTALLATION (Continued)

**Fig. 8 Hood Safety Latch Striker**

- 1 - RADIATOR SUPPORT CROSSMEMBER
- 2 - HOOD SAFETY LATCH STRIKER
- 3 - SCREW
- 4 - GOP BRACKET
- 5 - RADIATOR

**Fig. 9 Hood Silencer Pad**

- 1 - HOOD
- 2 - SILENCER PAD
- 3 - RETAINER

INSTALLATION

- (1) Position the hood silencer pad on the hood inner panel.
- (2) Install the retainers attaching the hood silencer pad to the inner hood panel.
- (3) Install the clips attaching the latch connecting rod to the hood inner panel.
- (4) Install the hood latch release bellcrank.
- (5) Close hood.

COWL WEATHERSTRIP**REMOVAL**

The cowl weatherstrip is attached to the cowl with adhesive tape.

- (1) Peel weatherstrip from cowl (Fig. 10).

**Fig. 10 Cowl Weatherstrip**

- 1 - WEATHERSTRIP
- 2 - DASH PANEL
- 3 - COWL

INSTALLATION

- (1) Clean contact surface with Mopar Super Kleen or equivalent.
- (2) Position weatherstrip on cowl.
- (3) Press weatherstrip into place.

COWL GRILLE**REMOVAL**

- (1) Remove the windshield wiper arms from the pivots.
- (2) Remove the screws that attach the grille to the cowl.
- (3) Remove the windshield washer tubes from the nozzles.
- (4) Remove the cowl grille and screen from the cowl (Fig. 11).

INSTALLATION

CAUTION: The washer fluid tubes must be routed and installed so that they are not pinched.

- (1) Position the cowl grille and screen on the cowl.
- (2) Install the windshield washer tubes on the nozzles.
- (3) Install the cowl screen and grille screws with new sealer. Tighten in sequence (Fig. 12).

REMOVAL AND INSTALLATION (Continued)

**Fig. 11 Cowl Grille, Screen & Washer Nozzles**

- 1 - PLASTIC PUSH-RIVET
- 2 - SCREEN
- 3 - SCREEN
- 4 - RIVET
- 5 - NOZZLE
- 6 - GRILLE
- 7 - PLASTIC PUSH-RIVET
- 8 - GRILLE
- 9 - NOZZLE

NOTE: Force the cowl grille rearward while tightening the screws.

(4) Install the windshield wiper arms on the pivots.

**Fig. 12 Cowl Grille Screw Tightening Sequence****BODY DECALS**

Small nicks, scratches and other surface marks in a decal can be touched-up with paint.

To eliminate blisters and air bubbles in a decal, pierce them with a needle or pin.

A heat gun can also be used to remove small wrinkles in a decal.

Decal replacement requires that the metal repair and paint refinish be completed first.

The work area temperature should be between 21°C (70°F) and 32°C (90°F). **A decal should not be replaced if the work area temperature is less than 21°C (70°F).**

The following equipment and material are necessary for removal and installation:

- Liquid dish detergent (for the wetting solution).
- Mixture of wetting solution.
- Commercial wax and silicone removal solution.
- Isopropyl (rubbing) alcohol.
- Small squeegee (plastic or hard rubber).
- Water bucket and sponge.
- Clean wiping rags or paper towels.
- Heat gun (or infra-red heat bulb).
- Wax pencil.
- Sharp knife, single edge razor blade or X-acto knife.
- Pair of scissors.
- Needle or pin.

WARNING: USE DECAL REMOVAL SOLUTION IN A WELL-VENTILATED AREA ONLY.

A decal removal solution can be used for removal at areas where a heat gun is ineffective. Follow the manufacturers instructions whenever this type of product is used.

REMOVAL

- (1) Clean the repaired surface as necessary.
- (2) Start at one end of the decal and apply heat with a heat gun. Slowly peel the decal from the panel by pulling it back. **Do not pull the decal outward from panel.**

INSTALLATION

- (1) The area that will be covered by the decal must be cleaned with cleaning solution.
- (2) Freshly painted surfaces must be thoroughly dry.
- (3) Clean the painted surface with a commercial wax and silicone removal solution. Wipe the surface with a clean cloth and allow it to dry.
- (4) Prepare a wetting solution by mixing two or three teaspoons of dish detergent with 1 gallon of water. Do not use soap.

NOTE: Too much detergent will reduce the effectiveness of the mixture.

- (5) Use a clean sponge and apply the wetting solution to the adhesive side of the decal and to the painted panel surface. The wetting solution will permit ease of decal movement when positioning it.

REMOVAL AND INSTALLATION (Continued)

(6) Align a straight edge with the existing decal ends (Fig. 13).

NOTE: If applicable, the body panel character line can be used as the decal alignment reference.

(7) Position the decal and carrier on the body panel (Fig. 14) and the mark length with a wax pencil.

(8) Position the decal and carrier on the body panel and hold it in-place with masking tape.

(9) Lift the bottom edge of decal and carrier. Use the tape sections as hinges, and reverse the position of decal and carrier.

CAUTION: Always remove the carrier from the decal, never remove the decal from carrier

(10) Bend a corner of carrier outward and then, with a flick of the finger, separate the corner of carrier from the decal.

(11) Return the decal back to its original position. If a solution is being used, position adhesive side of the decal on panel. Apply the solution to the outside of the decal.

(12) Hold the decal against the panel surface while separating the carrier from the decal.

(13) If applicable, remove the cover from face of decal.

(14) Using a squeegee smooth out the decal to remove wrinkles and/or air bubbles.

(15) Inspect the decal with reflected light to find any damage. Remove all the air and/or moisture bubbles.

80be46ae

Fig. 14 Body Decals

EXTERIOR NAMEPLATES

REMOVAL

NOTE: Exterior nameplates are attached to body panels with adhesive tape.

(1) Apply a length of masking tape on the body, parallel to the top edge of the nameplate to use as a guide, if necessary.

(2) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun. Do not exceed 52°C (120°F) when heating emblem.

(3) Insert a plastic trim stick or a hard wood wedge behind the emblem to separate the adhesive backing from the body.

(4) Clean adhesive residue from body with MOPAR Super Clean solvent or equivalent.

INSTALLATION

(1) Remove protective cover from adhesive tape on back of emblem.

(2) Position emblem properly on body (Fig. 15).

(3) Press emblem firmly to body with palm of hand.

(4) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

REMOVAL AND INSTALLATION (Continued)

Fig. 15 Exterior Nameplates

- 1 - CHEROKEE
- 2 - LIMITED-SPORT-CLASSIC

SIDE VIEW MIRROR

REMOVAL

- (1) Remove the door trim panel.
- (2) Remove the screw attaching the mirror trim cover/speaker grille to the door inner panel.
- (3) remove push-in fastener attaching trim cover to door inner panel (use special tool C-4829).
- (4) Disconnect the power mirror wire connector, if equipped.
- (5) Remove the screws attaching the mirror to the door (Fig. 16).
- (6) Separate the mirror from the door.

Fig. 16 Side View Mirror

- 1 - SIDE VIEW MIRROR
- 2 - WIRE HARNESS
- 3 - SEAL
- 4 - GROMMET
- 5 - DOOR

INSTALLATION

- (1) Position the mirror on the door.
- (2) Install the screws attaching the mirror to the door.
- (3) Connect the power mirror wire connector, if equipped.
- (4) Install new push-in fastener.
- (5) Install the mirror trim cover/speaker grille.
- (6) Install the door trim panel.

FRONT FENDER FLARE

REMOVAL

- (1) Remove the screw attaching the lower part of flare to the bottom of the fender.
- (2) Remove the nuts attaching the fender flare retainer to the wheelhouse splash shield (Fig. 17).
- (3) Remove the liner from the fender.
- (4) Remove the fasteners attaching the fender flare and retainer to the fender.
- (5) Separate the fender flare and retainer from the fender.

Fig. 17 Fender Flare

- 1 - FENDER FLARE
- 2 - RETAINER
- 3 - FENDER
- 4 - LINER
- 5 - PUSH NUT
- 6 - RETAINER

INSTALLATION

- (1) Position the fender flare and retainer on the fender.
- (2) Install the nuts attaching the fender flare and retainer to the wheelhouse fender.
- (3) Install the screw attaching the lower part of flare to the bottom of the fender.

REMOVAL AND INSTALLATION (Continued)

FRONT WHEELHOUSE LINER

REMOVAL

- (1) Hoist vehicle.
- (2) Remove tire.
- (3) Remove the push-in fasteners attaching the wheelhouse liner to the inner fender.
- (4) Separate the wheelhouse liner from the fender (Fig. 18).

**Fig. 18 Front Wheelhouse Liner**

- 1 - FENDER
- 2 - WHEELHOUSE LINER
- 3 - INNER FENDER PANEL
- 4 - BRACE
- 5 - PUSH-IN FASTENER
- 6 - RETAINER

INSTALLATION

- (1) Position the wheelhouse liner in the fender.
- (2) Install new push-in fasteners attaching the wheelhouse liner to the inner fender.
- (3) Install tire.
- (4) Lower vehicle.

RIGHT FRONT FENDER

REMOVAL

- (1) Raise and support the hood.
- (2) Remove the grille opening panel (GOP).
- (3) If equipped, remove the radio antenna mast, and components from the fender.
- (4) Remove the coolant recovery bottle.
- (5) Raise and support the vehicle.
- (6) Remove the right front wheel.
- (7) Remove the front bumper end cap.
- (8) Remove the wheelhouse liner.
- (9) Remove the fender flare and retainers.
- (10) Disconnect all wire harness connectors.
- (11) Remove the air deflector.
- (12) Remove the fender lower screws (Fig. 19).

(13) Remove the fender top, front and the rear screws.

(14) Remove the screws attaching the fender to the inner support bracket (Fig. 20).

(15) Separate the fender from the inner fender panel.

INSTALLATION

- (1) Position the fender on the inner fender panel.
- (2) Install all fender screws finger-tight.
- (3) Align the fender with the body panels and tighten the screws attaching the fender to the body panels.
- (4) Install the air deflector.
- (5) Install the fender flare and retainers.
- (6) Install the wheelhouse liner.
- (7) Install the front bumper end cap.
- (8) Install the wheel, remove the support and lower the vehicle.
- (9) Install the grille opening panel (GOP).
- (10) Install the radio antenna.

LEFT FRONT FENDER

REMOVAL

- (1) Raise and support the hood.
- (2) Remove the grille opening panel (GOP).
- (3) Raise and support the vehicle.
- (4) Remove the left front wheel.
- (5) Remove the front bumper end cap.
- (6) Remove the fender flare and retainers.
- (7) Remove the wheelhouse liner.
- (8) Remove the air deflector.
- (9) Remove the fender lower screws.
- (10) Remove the fender top, front and the rear screws.
- (11) Remove the screws attaching the fender to the inner support bracket.
- (12) Separate the fender from the inner fender panel.

INSTALLATION

- (1) Position the fender on the inner fender panel.
- (2) Install all fender screws finger-tight.
- (3) Align the fender with the body panels and tighten the screws attaching the fender to the body panels.
- (4) Install the air deflector.
- (5) Install the wheelhouse liner.
- (6) Install the fender flare and retainers.
- (7) Install the front bumper.
- (8) Install the wheel, remove the support and lower the vehicle.
- (9) Install the grille opening panel (GOP).

REMOVAL AND INSTALLATION (Continued)

FRONT DOOR TRIM PANEL

REMOVAL

- (1) Roll window down.
- (2) Remove window crank, if equipped (Fig. 21).

(3) Remove the screws attaching the trim panel to the door inner panel (Fig. 22) and (Fig. 23).

(4) Separate the trim panel fasteners from door inner panel with a pry tool (use special tool C-4829) (Fig. 24).

(5) Lift the trim panel up and outward to separate from the inner belt seal.

(6) Move the door trim panel outward and disconnect the handle-to-latch rods.

(7) Disconnect the power door locks/windows/mirrors wire harness connectors, if equipped.

(8) Remove the trim panel from door.

INSTALLATION

(1) Replace any broken or damaged push-in fasteners.

(2) Connect the power door locks/windows/mirrors wire harness connectors, if equipped.

(3) Move the door trim panel outward and connect the handle-to-latch rods.

(4) Position the trim panel on the inner belt seal and push down to seat.

(5) Align the locating pins and push- (Fig. 25) in fasteners. Press inward to secure.

(6) Install the screws attaching the trim panel to the door inner panel.

(7) Install the window crank, if equipped.

REMOVAL AND INSTALLATION (Continued)

80ad2f28

J898S-8

Fig. 24 Detaching Trim Panel Push-In Fasteners

(4) Grasp the upper and lower rearward corners of the waterdam and rapidly peel back the waterdam from the door inner panel.

(5) Separate the waterdam from the door inner panel.

INSTALLATION

(1) Route the latch rods through the waterdam.

(2) Position the waterdam on the door, apply adhesive as necessary and press into place.

(3) Route the harnesses/connectors through the waterdam.

FRONT DOOR WATERDAM**REMOVAL**

The waterdam is attached to the door inner panel with a butly adhesive. If cohesive separation of the butly between the waterdam and door inner panel occurs during the removal process, cut the strands of butly with a razor knife or equivalent.

(1) Remove door trim panel.

(2) Disengage clips attaching wire harnesses to the door inner panel.

(3) Push the harnesses/connectors through the waterdam and into the door.

REMOVAL AND INSTALLATION (Continued)

Fig. 25 Push-In Fasteners

- 1 – LOCATING PINS
- 2 – TRIM PANEL
- 3 – PUSH-IN FASTENERS

- (4) Engage clips attaching wire harnesses to the door inner panel.
- (5) Install door trim panel.

FRONT DOOR

REMOVAL

- (1) Remove door restraint (check) retaining pin.
- (2) For vehicles equipped with power windows, power mirrors and power door locks, remove trim panel and waterdam. Disconnect all components and route wire harness out of door.
- (3) Remove bolts that attach hinge to door (Fig. 26).
- (4) Remove door from vehicle.

INSTALLATION

- (1) Position door in body opening.
- (2) Align door hinges, plates and shims and install bolts. Tighten bolts to 3 N·m (2 ft. lbs.) torque.
- (3) Install door restraint (check) pin.
- (4) If applicable, route and connect wire harness connectors.
- (5) Install door waterdam and trim panel.

FRONT DOOR HINGE

REMOVAL

- (1) Remove door restraint (check) retaining pin.
- (2) Remove door hinge bolts and shims (Fig. 26).
- (3) Retain door hinge shims for correct installation.

INSTALLATION

- (1) Position hinge plates and shims on door face.

Fig. 26 Front Door Hinge

- 1 – UPPER HINGE
- 2 – SHIM
- 3 – LOWER HINGE
- 4 – FRONT DOOR

- (2) Align door hinges and shims with bolt holes and install hinge bolts. Tighten bolts to 3 N·m (2 ft. lbs.) torque.

- (3) Adjust/align latch striker and latch as necessary.
- (4) Install door restraint (check) retaining pin.

FRONT DOOR RESTRAINT

REMOVAL

- (1) Remove door trim panel.
- (2) Remove door radio speaker from door inner panel.
- (3) Remove door restraint (check) retaining pin from bracket with a punch.
- (4) Remove nuts and remove restraint via speaker opening. (Fig. 27).

INSTALLATION

- (1) Position door restraint in door by way of opening and install nuts.

NOTE: Ensure the spring on the door restraint is facing outward.

- (2) Position door restraint in bracket with holes aligned and insert retaining pin.
- (3) Install radio speaker and door trim panel.

FRONT DOOR OUTSIDE HANDLE

REMOVAL

- (1) Remove the door trim panel and waterdam.

REMOVAL AND INSTALLATION (Continued)

J9223-283

- 2 - RETAINING PIN
- 3 - NUT
- 4 - DOOR RESTRAINT
- 5 - RESTRAINT BRACKET
- 6 - DOOR INNER PANEL
- 7 - SPEAKER OPENING

(2) Remove the access hole cover and remove the rearward nut attaching the door handle to the door. (Fig. 28).

(3) Disconnect the handle-to-latch rod from the handle latch release lever arm.

(4) Remove the forward nut attaching the handle to the door.

(5) Separate the handle from the door.

80aa4ad4

Fig. 28 Front Door Outside Handle

- 1 - OUTSIDE DOOR HANDLE
- 2 - OUTSIDE HANDLE TO LATCH ROD
- 3 - DOOR LATCH
- 4 - OUTSIDE HANDLE TO LATCH ROD

INSTALLATION

(1) Position the handle in the door.

(2) Install the forward nut attaching the handle to the door.

(3) Connect the latch to handle rod, to the handle latch release lever arm.

(4) Install the rearward nut attaching the door handle to the door.

(5) Install the access hole cover.

(6) Install the door waterdam and trim panel.

FRONT DOOR LOCK CYLINDER**REMOVAL**

(1) Remove the door trim panel.

(2) Peel back waterdam to access lock cylinder.

(3) Disconnect the door latch-to-lock cylinder rod at the door latch (Fig. 29).

(4) Remove the lock cylinder retainer clip.

(5) Remove the lock cylinder.

(6) If applicable, remove the door latch-to-lock cylinder rod from the original lock cylinder. Connect it to the replacement lock cylinder.

80aa4ad6

Fig. 29 Door Lock Cylinder

- 1 - ACCESS PLUG
- 2 - RETAINER
- 3 - LOCK CYLINDER TO LATCH ROD
- 4 - LATCH
- 5 - LOCK CYLINDER TO LATCH ROD
- 6 - LOCK CYLINDER
- 7 - GASKET

INSTALLATION

(1) Position the lock cylinder and in the door opening.

(2) Install the retainer clip.

(3) Connect the door latch-to-lock cylinder rod to the door latch.

(4) Press the waterdam into position.

(5) Install the door trim panel.

REMOVAL AND INSTALLATION (Continued)

LOCK CYLINDERS

Ignition, door, deck lid, and rear hatch lock cylinders are all codable to the key. Lock barrels, tumblers, and tumbler springs are available to allow the technician to change replacement locks cylinders to match the customer's original key set. See the appropriate section in this manual for lock cylinder removal. See the Mopar® catalogue for part numbers and lock coding procedures.

FRONT DOOR LATCH

REMOVAL

- (1) Remove door trim panel and waterdam.
- (2) Remove screws attaching latch to door.
- (3) Disconnect all rods from latch (Fig. 30).
- (4) Disconnect power lock motor wire connector, if equipped.
- (5) Remove latch from door face.

Fig. 30 Door Latch

- 1 - FRONT DOOR LATCH
- 2 - LOCK BUTTON TO LATCH ROD
- 3 - INSIDE HANDLE TO LATCH ROD
- 4 - OUTSIDE HANDLE TO LATCH ROD
- 5 - LOCK CYLINDER TO LATCH ROD

80aa4ad2

INSTALLATION

- (1) Position latch on door face.
- (2) Connect power lock motor wire connector, if equipped.
- (3) Connect all rods to latch.
- (4) Install screws attaching latch to door. Tighten screws to 11 N·m (8 ft. lbs.) torque.
- (5) Install waterdam and door trim panel.

FRONT DOOR LATCH STRIKER

REMOVAL

- (1) Using a grease pencil or equivalent, mark position of striker.

- (2) Remove screws attaching striker to B-pillar (Fig. 31).
- (3) Separate striker from B-pillar.

80aa4ad3

Fig. 31 Front Door Latch Striker

- 1 - SPACER
- 2 - TAPPING PLATE
- 3 - STRIKER

INSTALLATION

- (1) Position and align striker on B-pillar.
- (2) Install screws attaching striker to B-pillar. Tighten screws to 28 N·m (20 ft. lbs.) torque.

FRONT DOOR INSIDE HANDLE ACTUATOR

REMOVAL

The front door inside handle actuator is heat staked to the front door trim panel during the manufacturing process.

- (1) Remove the door trim panel.
- (2) Using an X-ACTO knife or equivalent, cut the melted tabs securing the inside handle to the door trim panel.
- (3) Separate the inside handle from the trim panel.

INSTALLATION

- (1) Position the inside handle in the trim panel.
- (2) Heat stake the inside handle to the trim panel.
- (3) Install the door trim panel.

FRONT DOOR INNER BELT WEATHERSTRIP

REMOVAL

- (1) Roll window down.
- (2) Remove door trim panel.
- (3) Pull up on the rear corner of the weatherstrip and lift from the door (Fig. 32).

REMOVAL AND INSTALLATION (Continued)

80aa0fe2

Fig. 32 Front Door Inner/Outer Belt Weatherstrip

- 1 - OUTER BELT WEATHERSTRIP
2 - INNER BELT WEATHERSTRIP
3 - DOOR INNER PANEL

INSTALLATION

- (1) Position the weatherstrip on the door.
- (2) Push weatherstrip down to seat onto door.
- (3) Install door trim panel.

FRONT DOOR OUTER BELT WEATHERSTRIP**REMOVAL**

- (1) Roll window down.
- (2) Using a trim stick, pry up the rear outer corner of the weatherstrip.
- (3) Lift the weatherstrip up to separate from the door (Fig. 32).

INSTALLATION

- (1) Position the weatherstrip on the door.
- (2) Push weatherstrip down to seat onto door.

FRONT DOOR GLASS RUN CHANNEL WEATHERSTRIP**REMOVAL**

- (1) Remove door trim panel.
- (2) Remove waterdam.
- (3) Starting at rear corner, peel weatherstrip from around door frame.

INSTALLATION

- (1) Install the weatherstrip in the following sequence:

- Press weatherstrip into upper rear corner.
- Press weatherstrip into lower front corner.
- Work/press the weatherstrip upward and to the upper front corner, seat the weatherstrip into the channel.

- Continue working/pressing the weatherstrip into the channel along the upper window frame.
- Press weatherstrip into lower rear corner.
- Work/press the weatherstrip upward and to the upper rear corner, seat the weatherstrip into the channel.
- Press the weatherstrip to seat into the front lower glass run channel.
- (2) As applicable, move upward and forward evenly until the weatherstrip seal is fully seated in the channel.
- (3) Install waterdam.
- (4) Install door trim panel.

FRONT DOOR OPENING WEATHERSTRIP**REMOVAL**

- (1) Remove A-pillar trim panel.
- (2) Remove B-pillar upper trim panel.
- (3) Remove cowl side trim panel.
- (4) Remove inner scuff plate.
- (5) Remove B-pillar lower trim panel.
- (6) Grasp seal and separate from door opening.

80aa0fd7

- 1 - FRONT DOOR SEAL
2 - A PILLAR
3 - SECONDARY DOOR SEAL
4 - FRONT DOOR SEAL
5 - REAR DOOR SEAL
6 - ENDS MEET AT CENTERLINE
7 - A PILLAR

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

- (1) Position weatherstrip at corners.
- (2) Move upward and around edge of door opening. Seat seal on flange.
- (3) When installing a door opening weatherstrip seal, start at the door sill center line.
- (4) Move upward and around the perimeter of the door opening and seat the weatherstrip on the flange (Fig. 34).
- (5) Install cowl side trim panel.
- (6) Install inner scuff plate.
- (7) Install B-pillar lower trim panel.
- (8) Install B-pillar upper trim panel.
- (9) Install A-pillar trim panel.

(X) - PRESS INWARD
FIRMLY AT INDICATED AREA

- 10 - FRONT DOOR WEATHERSTRIP SEAL
- 11 - FLANGE
- 12 - SEAL
- 13 - FLANGE

FRONT DOOR OPENING SECONDARY WEATHERSTRIP

REMOVAL

The front door opening secondary weatherstrip is attached to the A-pillar with adhesive tape (Fig. 33).

- (1) Using a heat gun, heat the weatherstrip and slowly peel the weatherstrip from the A-pillar

INSTALLATION

- (1) Clean the contact surface on the A-pillar.
- (2) Remove the carrier backing and position the weatherstrip on the A-pillar. Press into place.

FRONT DOOR GLASS EXTERIOR MOLDING

REMOVAL

- (1) Open the window completely.
- (2) Remove the outer belt weatherstrip.
- (3) Pry and pull the molding sections from the door panel flange (Fig. 35).

80aa0fe3

Fig. 35 Front Door Glass Exterior Molding

- 1 - UPPER MOLDING
- 2 - SHIM
- 3 - REAR MOLDING

INSTALLATION

- (1) Start at the forward end of the upper molding, force the molding onto the door panel and continue rearward until it is completely seated on the flange.
- (2) Mate the rear molding with the upper molding and force the molding edge inward.
- (3) Continue pressing and moving downward to complete the installation.
- (4) Install the outer belt weatherstrip.

FRONT DOOR WINDOW REGULATOR

REMOVAL

- (1) Remove the door trim panel.
- (2) Remove the waterdam.
- (3) Remove the window glass

REMOVAL AND INSTALLATION (Continued)

(4) Loosen the bolts attaching the regulator to the inner door panel (Fig. 36) and (Fig. 37) as applicable.

(5) Lift the regulator upward to release it from the key hole slots and remove it through the access hole in the door inner panel.

Fig. 36 Power Window Regulator

- 1 - FRONT DOOR
- 2 - LOOSEN BOLTS
- 3 - LOOSEN NUTS

INSTALLATION

Fig. 37 Manual Window Regulator

- 1 - FRONT DOOR
- 2 - LOOSEN BOLTS

(1) Position the regulator in the door and align with key hole slots.

(2) Attach the regulator to door inner panel with bolts (Fig. 38).

(3) Install the window glass

(4) Install the waterdam.

(5) Install the trim panel.

Fig. 38 Front Door Regulator

- 1 - GLASS

REMOVAL AND INSTALLATION (Continued)

FRONT DOOR SPACER BLOCKS—TWO-DOOR VEHICLES

REMOVAL

- (1) Upper spacer block: drill-out the rivet heads and remove them from the reinforcement plate (Fig. 39).
- (2) Lower spacer block: remove the screws from the door face (Fig. 40).
- (3) As applicable, remove the spacer block from the door window frame or door face.

Fig. 39 Front Door Upper Spacer Block—Two-Door

- 1 - FRONT DOOR WINDOW FRAME
- 2 - RIVET
- 3 - WINDOW OUTER FRAME
- 4 - WINDOW INNER FRAME
- 5 - WINDOW GLASS

- 9 - WINDOW OUTER FRAME
- 10 - REINFORCEMENT PLATE
- 11 - DOOR UPPER SPACER BLOCK
- 12 - WINDOW INNER FRAME
- 13 - RIVET
- 14 - ADHESIVE

INSTALLATION

- (1) As applicable, position the spacer block on the door window frame or door face.
- (2) Upper spacer block: Install the replacement rivets in the spacer block and reinforcement plate.
- (3) Lower spacer block: install the screws in the door face. Tighten the screws to 1 N·m (11 in-lbs) torque.

FRONT DOOR GLASS

REMOVAL

- (1) Remove the door trim panel.
- (2) Remove the waterdam.

J9223-263

- 1 - DOOR SPACER
- 2 - DOOR FACE
- 3 - DOOR FACE
- 4 - DOOR SPACER
- 5 - SCREW
- 6 - SCREW

- (3) Remove inner and outer belt weatherstrip.
- (4) Roll glass up to expose the bolts attaching the glass to the regulator.
- (5) Remove the bolts attaching the glass to the regulator (Fig. 41).
- (6) Lift the glass upward and out of the door.

80aa4b5f

Fig. 41 Front Door Glass

- 1 - NUT
- 2 - RETAINER
- 3 - WINDOW GLASS
- 4 - REGULATOR

INSTALLATION

- (1) Position the glass in the door.
- (2) Install the bolts attaching the glass to the regulator. Tighten the bolts to 4 N·m (36 in-lbs) torque.
- (3) Install inner and outer belt weatherstrip.

REMOVAL AND INSTALLATION (Continued)

- (4) Attach the door waterdam to the door inner panel with adhesive/sealant.
- (5) Install the waterdam.
- (6) Install the door trim panel.

REAR DOOR TRIM PANEL

REMOVAL

- (1) Roll window down.
- (2) Remove window crank, if equipped (Fig. 42).
- (3) Remove the screws attaching the trim panel to the door inner panel (Fig. 43) and (Fig. 44).
- (4) Separate the trim panel fasteners from door inner panel with a pry tool (use special tool C-4829) (Fig. 45).
- (5) Lift the trim panel up and outward to separate from the inner belt seal.
- (6) Move the door trim panel outward and disconnect the handle-to-latch rods (Fig. 46).
- (7) Disconnect the power windows wire harness connectors, if equipped.
- (8) Remove the trim panel from door.

80ad2f28

80aff4e4

Fig. 44 Rear Door Trim Panel—Power Window

- 1 - U-NUT
- 2 - REAR DOOR
- 3 - TRIM PANEL
- 4 - PUSH-IN FASTENER

INSTALLATION

- (1) Replace any broken or damaged push-in fasteners.
- (2) Connect the power window wire harness connectors, if equipped.
- (3) Move the door trim panel outward and connect the handle-to-latch rods.
- (4) Position the trim panel on the inner belt seal and push down to seat.
- (5) Align the locating pins and push-in fasteners (Fig. 47). Press inward to secure.
- (6) Install the screws attaching the trim panel to the door inner panel.
- (7) Install the window crank, if equipped.

REAR DOOR WATERDAM

REMOVAL

- (1) Remove door trim panel.
- (2) Peel the waterdam from the door.
- (3) Route the latch rods and wire harnesses through the waterdam.
- (4) Separate the waterdam from the door inner panel.

INSTALLATION

- (1) Route the latch rods and wire harnesses through the waterdam.

REMOVAL AND INSTALLATION (Continued)

Fig. 45 Detaching Trim Panel Push-In Fasteners

J898S-8

Fig. 46 Latch Rods

- 1 - INSIDE HANDLE TO LATCH ROD
- 2 - INSIDE HANDLE ACTUATOR
- 3 - CLIP
- 4 - LOCK TO LATCH ROD

(2) Position the waterdam on the door, apply adhesive as necessary and press into place.

(3) Install door trim panel.

REAR DOOR

REMOVAL

- (1) Remove door restraint (check) retaining pin.
- (2) For vehicles equipped with power windows and power door locks, remove trim panel and waterdam. Disconnect all components and route wire harness out of door.

80ab5cdf

Fig. 47 Push-In Fasteners

- 1 - LOCATING PINS
- 2 - PUSH-IN FASTENERS

- (3) Remove bolts attaching hinge to door face.
- (4) Separate door from vehicle.

INSTALLATION

- (1) Position door in body opening.
- (2) Align door hinges, plates and shims and install bolts. Tighten bolts to 3 N·m (2 ft. lbs.) torque.
- (3) Install door restraint (check).
- (4) If applicable, route and connect wire harness connectors.
- (5) If necessary, install door waterdam and trim panel.

REAR DOOR RESTRAINT

REMOVAL

- (1) Remove the door trim panel.
- (2) Remove the door restraint (check) retaining pin from the bracket with a punch.
- (3) Remove the nuts and remove the restraint via the access opening in the door inner panel (Fig. 48).

INSTALLATION

- (1) Position the door restraint in the door by way of the opening and install the nuts. Tighten the nuts to 10 N·m (7 ft-lbs) torque.
- (2) Position the door restraint in bracket with the holes aligned and insert the retaining pin.

REAR DOOR HINGE

REMOVAL

- (1) Remove door restrain (check) pin.
- (2) Remove door hinge bolts and shims.
- (3) Retain bolts and shims for correct installation.

REMOVAL AND INSTALLATION (Continued)

**Fig. 48 Door Restraint (Check)**

- 1 - RETAINING PIN
- 2 - DOOR RESTRAINT
- 3 - ACCESS OPENING
- 4 - DOOR INNER PANEL
- 5 - NUT
- 6 - RESTRAINT BRACKET
- 7 - B-PILLAR

INSTALLATION

- (1) Position hinge plates and shims on door face.
- (2) Align door hinges and shims with bolt holes and install hinges. Tighten bolts to 3 N·m (2 ft. lbs.).
- (3) Adjust/align latch striker and latch as necessary.
- (4) Install door restrain (check) retaining pin.

REAR DOOR OUTSIDE HANDLE**REMOVAL**

- (1) Remove the door trim panel.
- (2) Roll the window to the full up position.
- (3) Peel back the waterdam to access the fasteners for the outside handle.
- (4) Remove the latch.
- (5) Remove the access hole cover.
- (6) Remove the nuts attaching the door handle to the door (Fig. 49).
- (7) Disconnect the handle-to-latch rod from the handle latch release lever arm (Fig. 50).

INSTALLATION

- (1) Position the handle at the door panel.
- (2) Connect the latch-to-handle rod to the handle latch release lever arm.
- (3) Install nuts attaching the door handle to the door.
- (4) Install the latch.
- (5) Install the waterdam.
- (6) Install the trim panel.

**Fig. 49 Rear Door Outside Handle**

- 1 - INSIDE HANDLE TO LATCH ROD
- 2 - LOCK TO LATCH ROD
- 3 - OUTSIDE HANDLE
- 4 - OUTSIDE HANDLE TO LATCH ROD

**Fig. 50 Latch Rod**

- 1 - OUTSIDE HANDLE

- 3 - CLIP

REAR DOOR LATCH**REMOVAL**

- (1) Remove access plug.
- (2) Remove door trim panel.
- (3) Remove waterdam.
- (4) Remove screws attaching door latch to door (Fig. 51).
- (5) Disconnect all rods from door latch.
- (6) Remove door latch from door.

INSTALLATION

- (1) Position door latch in door.
- (2) Connect all rods to door latch.

REMOVAL AND INSTALLATION (Continued)

80524e45

Fig. 51 Rear Door Latch

- 1 - ACCESS HOLE
- 2 - INSIDE RELEASE TO LATCH ROD

- 4 - HANDLE
- 5 - LATCH ROD
- 6 - LATCH ADJUSTMENT SCREW
- 7 - REAR DOOR

- (3) Install screws attaching door latch to door. Tighten screws to 11 N·m (8 ft. lbs.) torque.
- (4) Install waterdam.
- (5) Install door trim panel.
- (6) Install access plug.

REAR DOOR LATCH STRIKER**REMOVAL**

- (1) Using a grease pencil or equivalent, mark position of striker.
- (2) Remove screws attaching striker to C-pillar (Fig. 52).
- (3) Separate striker from C-pillar.

INSTALLATION

- (1) Position and align striker on C-pillar.
- (2) Install screws attaching striker to C-pillar. Tighten screws to 28 N·m (20 ft. lbs.) torque.

REAR DOOR INSIDE HANDLE ACTUATOR**REMOVAL**

The rear door inside handle actuator is heat staked to the rear door trim panel during the manufacturing process.

- (1) Remove the door trim panel.
- (2) Using an X-ACTO knife or equivalent, cut the melted tabs securing the inside handle to the door trim panel.

80aa4ad3

Fig. 52 Rear Door Latch Striker

- 1 - SPACER
- 2 - TAPPING PLATE
- 3 - STRIKER

- (3) Separate the inside handle from the trim panel.

INSTALLATION

- (1) Position the inside handle in the trim panel.
- (2) Heat stake the inside handle to the trim panel.
- (3) Install the door trim panel.

REAR DOOR INNER BELT WEATHERSTRIP**REMOVAL**

- (1) Roll window down.
- (2) Remove door trim panel.
- (3) Pull up on the rear corner of the weatherstrip and lift from the door (Fig. 53).

INSTALLATION

- (1) Position the weatherstrip on the door.
- (2) Push weatherstrip down to seat onto door.
- (3) Install door trim panel.

REAR DOOR OUTER BELT WEATHERSTRIP**REMOVAL**

- (1) Roll window down.
- (2) Using a trim stick, pry up the rear outer corner of the weatherstrip.
- (3) Slowly and carefully, lift the weatherstrip up to separate from the door (Fig. 53).

REMOVAL AND INSTALLATION (Continued)

- 1 - OUTER BELT WEATHERSTRIP
- 2 - INNER BELT WEATHERSTRIP
- 3 - GLASS CHANNEL WEATHERSTRIP
- 4 - DOOR INNER PANEL
- 5 - GLASS CHANNEL
- 6 - DOOR OUTER PANEL

INSTALLATION

- (1) Position the weatherstrip on the door.
- (2) Push weatherstrip down to seat onto door.

REAR DOOR GLASS RUN CHANNEL WEATHERSTRIP**REMOVAL**

- (1) Remove door trim panel.
- (2) Remove waterdam.
- (3) Remove window glass.
- (4) Starting at rear corner, peel weatherstrip from around door frame (Fig. 53).

INSTALLATION

- (1) Starting at the top corner, press seal into place. A small amount of adhesive can be used to hold the weatherstrip in-place, if necessary.
- (2) As applicable, move downward evenly until the weatherstrip seal is fully seated in the channel.
- (3) Install window glass.
- (4) Install waterdam.
- (5) Install door trim panel.

REAR DOOR GLASS EXTERIOR MOLDING**REMOVAL**

- (1) Open the window.
- (2) Remove the outer belt molding.
- (3) Pry and pull the molding sections from the door panel flange (Fig. 54).

80aa0fe5

Fig. 54 Rear Glass Exterior Molding

- 1 - UPPER MOLDING
- 2 - MOLDING
- 3 - SHIM
- 4 - OUTER BELT MOLDING
- 5 - SHIM
- 6 - OUTER DOOR PANEL

INSTALLATION

- (1) Starting at the forward end of the upper molding, force the molding onto the door panel flange and continue rearward until it is completely seated on the flange.
- (2) Mate the rear molding with the upper molding and force the molding edge inward.
- (3) Continue pressing and moving downward to complete the installation.
- (4) Install the outer belt molding.

REAR DOOR WEATHERSTRIP**REMOVAL**

- (1) Remove B-pillar upper trim.
- (2) Remove inner scuff plate.
- (3) Remove B-pillar lower trim.
- (4) Remove upper door opening trim.
- (5) Grasp seal and separate from door opening (Fig. 55).

REMOVAL AND INSTALLATION (Continued)

Fig. 55 Door Opening Weatherstrip

- 1 - FRONT DOOR SEAL
- 2 - A PILLAR
- 3 - SECONDARY DOOR SEAL
- 4 - FRONT DOOR SEAL
- 5 - REAR DOOR SEAL
- 6 - ENDS MEET AT CENTERLINE
- 7 - A PILLAR

INSTALLATION

- (1) When installing a door opening weatherstrip seal, start at the door sill center line.
- (2) Move upward and around edge of door opening. Seat seal on flange.
- (3) Move upward and around the perimeter of the door opening and seat the weatherstrip on the flange (Fig. 56).
- (4) Install upper door opening trim.
- (5) Install inner scuff plate.
- (6) Install B-pillar lower trim panel.
- (7) Install B-pillar upper trim panel.

REAR DOOR WINDOW REGULATOR

REMOVAL

- (1) Remove the door trim panel.
- (2) Remove the waterdam.
- (3) Remove the bolt attaching the window glass to the regulator and support the glass (Fig. 57).
- (4) Remove the lower bolts attaching the regulator to the inner door panel (Fig. 58).
- (5) Remove the nuts attaching the regulator motor to the inner door panel, if equipped.
- (6) Loosen the upper bolt that attaches the regulator to the inner door panel.

- 11 - FLANGE
- 12 - SEAL
- 13 - FLANGE

- (7) Disconnect the wire harness connector from the regulator drive motor, if equipped.
- (8) Remove the regulator and drive motor, if equipped.

INSTALLATION

- (1) Position window regulator and, if equipped, drive motor within the door panels.
- (2) Install the fasteners attaching the regulator to the door inner panel.
- (3) Connect the regulator wire harness connector.
- (4) Position the window glass at the regulator and install the retainer, bushing and bolt.
- (5) Install the waterdam.
- (6) Install the trim panel.

REAR DOOR WINDOW GLASS

REMOVAL

- (1) Lower the window glass.
- (2) Remove the trim panel.

REMOVAL AND INSTALLATION (Continued)

J9223-501

Fig. 57 Regulator To Glass Screw Removal/Installation

- 1 - ANCHOR

- 4 - REGULATOR
- 5 - SCREW AND BUSHING
- 6 - WINDOW GLASS

(8) Remove the window glass from door.

80ac2bd7

Fig. 59 Division Bar/Stationary Glass

- 1 - UPPER SCREW
- 2 - GLASS
- 3 - LOWER SCREW
- 4 - DIVISION BAR

INSTALLATION

- (1) Install the glass in the door, and install the retainer, bushing and screw.
- (2) Tighten the glass attaching screw 6 N·m (53 in-lbs) torque.
- (3) Install the division bar/stationary glass in the door.
- (4) Install the glass run channel weatherstrip.
- (5) Install the inner and outer beltline weatherstrip.
- (6) Install the waterdam.
- (7) Install the trim panel.

BODY SIDE MOLDING

REMOVAL

- (1) Loosen the body side molding (Fig. 60) with a heat gun.
- (2) Lift edge of molding with a putty knife and peel molding from body panel. Apply heat to any location where the molding remains adhered to a panel.
- (3) Remove the adhesive from the body panel with Mopar Super Clean solvent or equivalent.
- (4) If the original molding will be installed, also remove all adhesive from it.

INSTALLATION

- (1) If the original molding will be installed, apply 3M 5344 double-sided tape on the molding.
- (2) For vertical alignment, use masking tape or a string as reference.

80ab5cda

Fig. 58 Rear Door Window

- 1 - REAR DOOR

- 5 - REGULATOR MOTOR

- (3) Remove the waterdam.
- (4) Remove inner and outer beltline weatherstrip.
- (5) Remove the window weatherstrip from the door.
- (6) Remove the division bar/stationary glass (Fig. 59).
- (7) Remove the window glass screw, bushing and retainer from the regulator.

REMOVAL AND INSTALLATION (Continued)

80aef1cb

Fig. 60 Body Side Molding—4-Door

(3) Remove the backing from the tape, align the molding and position it on the body panel.

(4) Press the molding onto the body panel with a roller or hand pressure.

REAR FENDER FLARE

REMOVAL

(1) Remove the screw attaching the lower part of flare to the bottom of the fender.

(2) Remove the nuts attaching the fender flare retainer to the wheelhouse liner (Fig. 61).

(3) Separate the fender flare and retainer from the fender.

80aafb64

Fig. 61 Fender Flare

- 1 - CENTER RETAINER
- 2 - WHEELHOUSE LINER
- 3 - BODY
- 4 - REAR RETAINER
- 5 - FENDER FLARE

INSTALLATION

(1) Position the fender flare and retainer on the fender.

(2) Install the nuts attaching the fender flare and retainer to the wheelhouse liner.

(3) Install the screw attaching the lower part of flare to the bottom of the fender.

QUARTER WINDOW APPLIQUE

REMOVAL

(1) Remove the liftgate pillar trim.

(2) Remove nuts from inside vehicle (Fig. 62).

(3) Using a trim sick or equivalent, carefully pry the applique the from panel.

INSTALLATION

(1) Position the replacement applique the on panel and install the nuts.

(2) Install the liftgate pillar trim.

80abac3e

Fig. 62 Quarter Window Applique and Drip Molding

- 1 - VEHICLE ROOF
- 2 - DRIP MOLDING
- 3 - DRIP MOLDING CLIP
- 4 - DRIP MOLDING
- 5 - CLIP
- 6 - QUARTER WINDOW APPLIQUE
- 7 - VEHICLE BODY
- 8 - NUT
- 9 - SEALANT

DRIP RAIL MOLDING

REMOVAL

(1) Pry the clips from the roof flange.

(2) Remove the clips and molding from the roof flange (Fig. 62).

REMOVAL AND INSTALLATION (Continued)

(3) Remove the remaining sealant and clean the roof flange.

INSTALLATION

(1) Position the drip rail molding with clips at the roof flange and force the clips onto the roof flange.

(2) Apply sealant to the inner side of the molding to seal the roof flange.

LUGGAGE RACK

REMOVAL

(1) Remove slide rail screws (Fig. 63).

(2) Remove luggage rack from roof.

NOTE: Skid strips are attached to roof panel with adhesive.

(3) Loosen each skid strip with a heat gun.

(4) Lift one edge of each skid strip with a putty knife and peel it from roof panel.

(5) Remove original adhesive from roof with an adhesive removal solution.

(6) If original skid strips are installed, remove all original adhesive from m.

J9223-97

Fig. 63 Luggage Rack

- 1 - SIDE RAIL
- 2 - CROSS RAIL
- 3 - CROSS RAIL ADJUSTMENT RELEASE BUTTON
- 4 - RIVET-NUT
- 5 - SCREW
- 6 - SKID STRIP
- 7 - ROOF

INSTALLATION

(1) Install 3M 06379 double-sided tape, or an equivalent on skid strips.

(2) Remove backing from double-sided tape, align each skid strip on roof, and position it on roof panel.

(3) Verify that each skid strip is properly aligned.

(4) Press each skid strip onto roof panel with a roller (or use hand pressure).

NOTE: To prevent water leaks, apply 3M Drip-Chek Sealant, or equivalent.

(5) Position luggage rack on roof with screw holes aligned.

(6) Install and tighten slide rail screws.

AIR EXHAUST GRILLE

REMOVAL

(1) Remove the screw that attaches the grille to the door opening panel (Fig. 64).

(2) Pry the bottom edge of the grille from the door opening panel.

(3) Pull downward and remove the grille from exhaust port in the door opening panel.

INTERNAL VIEW

J9123-138

Fig. 64 Door Opening Air Exhaust Grille

- 1 - SCREW
- 2 - AIR EXHAUST GRILLE
- 3 - C-PILLER
- 4 - AIR EXHAUST GRILLE
- 5 - DOOR OPENING PANEL

INSTALLATION

(1) Position the slot located in the upper end of replacement grille at the exhaust port and insert edge in the slot.

(2) Push inward and seat the grille in the exhaust port.

(3) Install the screw to attach the grille to the door opening panel.

REMOVAL AND INSTALLATION (Continued)

A-PILLAR TRIM

REMOVAL

- (1) Remove front and rear assist handles, if equipped.
- (2) Remove the inner scuff plate.
- (3) Remove the lower A-pillar cowl trim.
- (4) Using a small flat blade, pry the trim plugs from the A-pillar trim.
- (5) Remove the screws attaching the A-pillar trim to the A-pillar (Fig. 65).
- (6) Separate the A-pillar trim from the A-pillar.

INSTALLATION

- (1) Position the A-pillar trim on the A-pillar.
- (2) Install the screws attaching the A-pillar trim to the A-pillar.

- (3) Install the trim plugs.
- (4) Install the lower A-pillar cowl trim.
- (5) Install the inner scuff plate.
- (6) Install the assist handles.

LOWER A-PILLAR COWL TRIM

REMOVAL

- (1) Remove the inner scuff plate.
- (2) Remove the nut behind the fuse panel access door (Right side only) (Fig. 66).
- (3) Remove the fasteners attaching the lower A-pillar cowl trim to the A-pillar lower cowl.
- (4) Separate the lower A-pillar cowl trim from the A-pillar lower cowl.

80a89433

REMOVAL AND INSTALLATION (Continued)

**Fig. 66 Lower A-Pillar Cowl Trim**

- 1 - COWL PANEL
- 2 - COWL PANEL TRIM
- 3 - ACCESS DOOR
- 4 - NUT

INSTALLATION

- (1) Position the lower A-pillar cowl trim on the A-pillar lower cowl.
- (2) Install the screws attaching the lower A-pillar cowl trim to the A-pillar lower cowl.
- (3) Install the nut behind the fuse panel access door (Right side only).
- (4) Install the inner scuff plate.

FRONT INNER SCUFF PLATE**REMOVAL**

- (1) If necessary, remove the bucket seat side shield trim cover.
- (2) Remove the screws attaching the inner scuff plate to the front door sill (Fig. 65).
- (3) Separate the inner scuff plate from the door sill.

INSTALLATION

- (1) Position the inner scuff plate on the front door sill.
- (2) Install the screws attaching the inner scuff plate to the front door sill.
- (3) If removed, install the bucket seat side shield trim cover.

DOOR SILL SCUFF PLATE**REMOVAL**

- (1) Remove the screws attaching the door sill scuff plate to the door sill (Fig. 67).
- (2) Separate the scuff plate from the door sill.

**Fig. 67 Door Sill Scuff Plate**

- 1 - REAR DOOR SILL SCUFF PLATE
- 2 - FRONT DOOR SILL SCUFF PLATE

INSTALLATION

- (1) Position the scuff plate on the door sill.
- (2) Install the screws attaching the door sill scuff plate to the door sill.

ASSIST HANDLE**REMOVAL**

- (1) Using a trim stick or equivalent, open the end covers to access the screws.
- (2) Remove the screws (Fig. 65).
- (3) Separate the assist handle from the trim.

INSTALLATION

- (1) Position the handle on the trim.
- (2) Install the screws.
- (3) Install the covers.

B-PILLAR TRIM**REMOVAL**

- (1) Remove the inner scuff plate.
- (2) Remove the upper door opening trim (4-door vehicles) (Fig. 68).
- (3) Remove the upper quarter panel trim (2-door vehicles) (Fig. 65).
- (4) Remove the rear A-pillar trim screw.
- (5) Remove the shoulder belt turning loop.
- (6) Remove the seat/shoulder belt anchor bolt.
- (7) Remove the screws attaching the B-pillar trim to the B-pillar (2-door vehicles).
- (8) Route the shoulder belt through the lower B-pillar trim (2-door vehicles).
- (9) Separate the B-pillar trim from the B-pillar.

REMOVAL AND INSTALLATION (Continued)

80a89434

Fig. 68 B-Pillar Trim—4-Door Vehicles

- | | |
|----------------------------------|------------------------|
| 1 – UPPER DOOR OPENING TRIM | 10 – INNER SCUFF PLATE |

| 3 – UPPER QUARTER PANEL TRIM | 12 – ACCESS DOOR |
| 4 – LIFTGATE PILLAR TRIM | 13 – NUT |
| 5 – WHEEL HOUSE COVER | 14 – COWL PANEL TRIM |
| 6 – LOWER QUARTER PANEL TRIM | 15 – A-PILLAR TRIM |
| 7 – QUARTER PANEL TRIM EXTENSION | 16 – HEADLINER |
| 8 – COAT HOOK | 17 – B-PILLAR TRIM |
| 9 – OVERHEAD ASSIST HANDLE | 18 – TRIM PLUG |

INSTALLATION

(1) Route the shoulder belt through the lower B-pillar trim (2-door vehicles).

(2) Position the B-pillar trim on the B-pillar and align push-in fasteners.

(3) Press the B-pillar trim on the B-pillar to secure.

(4) Install the screws attaching the B-pillar trim to the B-pillar (2-door vehicles).

(5) Install the seat/shoulder belt anchor bolt.

(6) Install the shoulder belt turning loop.

(7) Install the A-pillar trim.

(8) Install the upper quarter panel trim (2-door vehicles) (Fig. 65).

(9) Install the upper door opening trim (4-door vehicles) (Fig. 68).

(10) Install the inner scuff plate.

C-PILLAR TRIM**REMOVAL**

(1) Remove the inner scuff plate.

(2) Remove the upper door opening trim.

(3) Remove the upper quarter panel trim.

(4) Remove the quarter panel trim extension.

(5) Remove the screws attaching the C-pillar trim to the C-pillar (Fig. 68).

(6) Separate the C-pillar trim from the C-pillar.

INSTALLATION

(1) Position the C-pillar trim on the C-pillar.

REMOVAL AND INSTALLATION (Continued)

- (2) Install the screws attaching the C-pillar trim to the C-pillar.
- (3) Install the quarter panel trim extension.
- (4) Install the upper quarter panel trim.
- (5) Install the upper door opening trim.
- (6) Install the inner scuff plate.

QUARTER PANEL TRIM EXTENSION

REMOVAL

- (1) Remove the inner scuff plate.
- (2) Separate quarter panel trim extension from the wheelhouse and quarter trim panels (Fig. 68).

INSTALLATION

- (1) Position the quarter panel trim extension on the wheelhouse and quarter trim panels.
- (2) Install the inner scuff plate.

QUARTER PANEL TRIM AND WHEELHOUSE COVER

REMOVAL

- (1) Remove the inner scuff plate.
- (2) Remove quarter panel trim extension.
- (3) Remove liftgate scuff plate.
- (4) Remove the screws attaching the quarter panel trim from the quarter panel and wheelhouse trim cover (Fig. 68) and (Fig. 65).
- (5) If necessary, remove the tire and mounting brackets from the left quarter panel trim (Fig. 69).
- (6) Remove the screws attaching the wheelhouse cover to the wheelhouse.
- (7) Separate the wheelhouse cover from the wheelhouse

INSTALLATION

- (1) Position the wheelhouse cover on the wheelhouse.
- (2) Install the screws attaching the wheelhouse cover to the wheelhouse.
- (3) If removed, install the tire and mounting bracket on the left quarter panel trim.

80a9f0f2

- 7 - WING NUT
- 8 - CAP
- 9 - MOUNTING BRACKET
- 10 - HOLD DOWN BOLT

REMOVAL AND INSTALLATION (Continued)

- (4) Position the quarter panel trim on the quarter panel and wheelhouse cover.
- (5) Install the screws attaching quarter panel trim on the quarter panel and wheelhouse cover
- (6) Install liftgate scuff plate.
- (7) Install quarter panel trim extension.
- (8) Install the inner scuff plate.

LIFTGATE PILLAR TRIM

REMOVAL

- (1) Remove the liftgate opening upper trim.
- (2) Remove the liftgate pillar trim screws (Fig. 70).
- (3) Remove the screws attaching the lower quarter panel trim to the liftgate pillar.
- (4) Pull the trim panel outward to detach the spring steel clips attaching the trim panel to the pillar (2-dr vehicles).
- (5) Remove liftgate pillar trim.

Fig. 70 Liftgate Pillar Trim

- 1 - UPPER LIFTGATE OPENING TRIM
 2 - UPPER LIFTGATE PILLAR TRIM
 3 - LOWER QUARTER TRIM

INSTALLATION

- (1) Position the liftgate pillar trim on the liftgate pillar.
- (2) Press the trim panel into place to engage the spring steel clips attaching the trim panel to the pillar (2-dr vehicles).
- (3) Install the screws attaching the lower quarter panel trim to the liftgate pillar.
- (4) Install the liftgate pillar trim screws.
- (5) Install the liftgate opening upper trim.

LIFTGATE OPENING UPPER TRIM

REMOVAL

- (1) Remove the screws attaching the liftgate opening upper trim to the roof panel (Fig. 71).

- (2) Pull downward to disengage steel clips attaching the liftgate opening upper trim to the roof panel.
- (3) Separate trim from vehicle.

Fig. 71 Liftgate Opening Upper Trim

- 1 - UPPER LIFTGATE OPENING TRIM

INSTALLATION

Steel clips are used for manufacturing purposes and are not required for service.

- (1) Position trim on roof panel.
- (2) Install the screws attaching the liftgate opening upper trim to the roof panel.

LIFTGATE SCUFF PLATE

REMOVAL

- (1) Remove the screws attaching the liftgate scuff plate to the floor pan (Fig. 72).
- (2) Separate the scuff plate from the vehicle.

INSTALLATION

- (1) Position the scuff plate on the vehicle.
- (2) Center striker in opening.
- (3) Install the screws attaching the liftgate scuff plate to the floor pan.

FRONT SHOULDER BELT/BUCKLE

CAUTION: Inspect the front shoulder belts and buckles. Replace any belt that is either cut, frayed, torn or damaged in any way. Replace the shoulder belt if the retractor is damaged or inoperative.

REMOVAL AND INSTALLATION (Continued)

80aa4b93

Fig. 72 Liftgate Scuff Plate

1 - LIFTGATE SCUFF PLATE

REMOVAL

(1) Slide the front seats all the way forward for access to the belt anchor bolt.

(2) Disconnect the belt wire harness connector.

(3) Remove the anchor bolt cover.

(4) Remove the anchor bolt attaching the buckle to the seat.

(5) Remove the turning loop cover concealing the shoulder belt upper anchor bolt.

(6) Use a Torx bit to remove the upper anchor bolt (Fig. 73). Remove the support/guide washer.

(7) Remove the inner scuff plate/trim panel from the door sill and remove the shoulder belt lower anchor bolt(s) with a Torx bit (Fig. 74) and (Fig. 75).

(8) Remove the shoulder belt and the retractor.

INSTALLATION

(1) Position the shoulder belt retractor in the shield and install the lower anchor bolt with a Torx bit. Tighten bolt to 43 N·m (32 ft. lbs.) torque.

(2) Position the support/guide washer and shoulder belt upper anchor plate on the trim panel. Install the upper anchor bolt with a Torx bit.

(3) Route belt through trim panel.

(4) Tighten the upper and lower anchor bolts to 43 N·m (32 ft. lbs.) torque.

(5) Install the door sill inner scuff plate/trim panel and install the cap over the upper anchor bolt.

(6) Install the shoulder belt buckle and anchor bolt. Connect the wire harness connectors. Tighten the buckle anchor bolt to 43 N·m (32 ft. lbs.) torque.

**Fig. 76 Rear Seat Shoulder/Lap Belts and Buckles**

- 1 - TURNING LOOP
- 2 - RETRACTOR
- 3 - LAP BELT AND BUCKLE

REAR SHOULDER/LAP BELT/BUCKLE

WARNING: Inspect rear shoulder/lap belts and buckles. Replace any belt that is either cut, frayed, torn or damaged in any way. Replace shoulder belt if retractor is damaged or inoperative.

REMOVAL

- (1) Pull rear seat release strap and tilt seat cushion forward.
- (2) Remove shoulder belt buckle and lap belt/buckle anchor plate bolts from floor pan (Fig. 76).
- (3) Remove shoulder belt lower outer anchor bolt.
- (4) Remove quarter trim panel. If necessary, refer to removal procedure.
- (5) Remove shoulder belt upper anchor bolt.
- (6) Remove bolt attaching retractor to rear quarter rail.
- (7) Separate retractor and shoulder belt from trim panel.

INSTALLATION

- (1) Position shoulder belt buckle and lap belt/buckle anchor plates on floor panel.
- (2) Install anchor bolts. Tighten bolts to 43 N·m (32 ft. lbs.) torque.

- (3) Install retractor support on rear quarter rail. Tighten screw.

- (4) Route shoulder belt through quarter trim panel slot.

- (5) Position shoulder belt at roof rail and install upper anchor bolt. Tighten bolt to 43 N·m (32 ft. lbs.) torque.

- (6) Install quarter trim panel.

- (7) Install shoulder belt lower anchor bolt. Tighten bolt to 43 N·m (32 ft. lbs.) torque.

- (8) Return rear seat cushion to normal position and engage latch.

FULL FLOOR CONSOLE**REMOVAL**

- (1) Remove the transmission shift lever handle/knob:

- Automatic transmissions, pull the handle straight upward to remove it.

- Insert a thin-blade tool under the edge of the transmission shift indicator bezel and pry up to remove.

- Manual transmissions, loosen the locknut and un-thread the shift knob from the shaft.

- Pull the shift boot up to remove.

- (2) Insert a thin-blade tool under the edge of the transfer case shift indicator bezel or cover plate and pry up to remove.

REMOVAL AND INSTALLATION (Continued)

- (3) Open the console lid.
- (4) Remove the screws attaching the console to the floor and mounting bracket (Fig. 77).
- (5) Disconnect the wire harness connector.
- (6) Separate the console from the floor.

**Fig. 77 Floor Console**

- 1 - TRANSFER CASE SHIFT BEZEL
- 2 - COVER
- 3 - TRANS SHIFT BEZEL
- 4 - FLOOR CONSOLE
- 5 - WASHER (2WD)
- 6 - BRACKET
- 7 - DUCT

INSTALLATION

- (1) Position the console on the floor.
- (2) Attach the air duct to the air outlet duct.
- (3) Connect the wire harness connectors.
- (4) Install the screws attaching the console to the mounting bracket.
- (5) Install the shift indicator bezels (or cover plate).
- (6) Install the shift lever handle/knob.

FRONT CARPET/MAT**REMOVAL**

- (1) Remove the door sill inner scuff plates.
- (2) Remove the front and rear seats (as applicable).
- (3) Remove floor console.
- (4) As necessary, remove the trim panels and moldings.
- (5) Remove all other interfering components.
- (6) Remove the carpet and mat from the floor panel (Fig. 78).

INSTALLATION

- (1) Position the carpet and mat on the floor panel.

J9123-128

Fig. 78 Front Carpet and Mat

- 1 - CARPET AND MAT
- 2 - POWER SEAT WIRE HARNESS SLOT
- 3 - FLOOR PANEL
- 4 - SEAT FRAME STUD

- (2) Install all the components that were removed to facilitate carpet/mat removal.

- (3) Install the trim panels and moldings.
- (4) Install the door sill inner scuff plates.
- (5) Install floor console.
- (6) Install the front and rear seats (as applicable).

REAR CARPET/MAT**REMOVAL**

- (1) Remove the liftgate latch striker and scuff plate.
- (2) Drill-out the retaining rivet heads and remove the cargo tie-down footman loops from the carpet.
- (3) As necessary, remove the trim panels and moldings.
- (4) Remove the all other interfering components.
- (5) Remove the carpet and mat from the floor panel.
- (6) If necessary, remove the insulation from the wheelhouse (Fig. 79).

INSTALLATION

- (1) If removed, install the insulation on the wheel-houses.
- (2) Position the mat on the floor panel.
- (3) Position the carpet on the mat.
- (4) Install all the components that were removed to facilitate carpet and mat removal.
- (5) Install the trim panels and moldings.
- (6) Install the cargo tie-down footman loops on the carpet with replacement rivets.
- (7) Install the liftgate scuff plate and latch striker.

REMOVAL AND INSTALLATION (Continued)

- 3 - ADHESIVE
- 4 - WHEELHOUSE PANEL
- 5 - FACE SIDE
- 6 - ADHESIVE
- 7 - WHEELHOUSE PANEL
- 8 - LOWER INSULATION
- 9 - UPPER INSULATION

REARVIEW MIRROR**REMOVAL**

- (1) Loosen the mirror base setscrew (Fig. 80).
- (2) Slide the mirror base upward and off the bracket.

80ad2f1f

Fig. 80 Rearview Mirror

- 1 - MIRROR
- 2 - SUPPORT BUTTON

INSTALLATION

- (1) Position the mirror base at the bracket and slide it downward onto the support bracket.
- (2) Tighten setscrew to 1 N·m (9 in. lbs.) torque.

REARVIEW MIRROR SUPPORT BRACKET**INSTALLATION**

- (1) Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
- (2) Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
- (3) Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
- (4) Apply accelerator to the surface on the bracket according to the following instructions:
 - Crush the vial to saturate the felt applicator.
 - Remove the paper sleeve.
 - Apply accelerator to the contact surface on the bracket.
 - Allow the accelerator to dry for five minutes.
 - Do not touch the bracket contact surface after the accelerator has been applied.
- (5) Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.

- (6) Install the bracket according to the following instructions:
 - Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
 - Apply an even coat of adhesive to the contact surface on the bracket.
 - Align the bracket with the marked position on the windshield glass.
 - Press and hold the bracket in place for at least one minute.

NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

- (7) Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
- (8) Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

REMOVAL AND INSTALLATION (Continued)

SUNVISORS

REMOVAL

(1) Remove the screws that attach the sunvisor arm support bracket to the headliner and the roof panel (Fig. 81) and (Fig. 82).

(2) Disconnect vanity lamp connector, if equipped.

(3) Detach the sunvisor from the support clip.

(4) Remove the sunvisor from the vehicle.

(5) Remove the retaining screw and support clip.

On vehicles equipped with an overhead console, the support clip is integral with the overhead console.

- 7 - SCREW
- 8 - ASSIST HANDLE
- 9 - WINDSHIELD SIDE MOULDING
- 10 - COVER PLUG
- 11 - SCREW

J9223-223

INSTALLATION

(1) Install the support bracket and the retaining screw.

(2) Connect vanity lamp connector, if equipped.

(3) Position the sunvisor in the support clip and align the arm support bracket holes with the headliner holes.

(4) Install the screws that attach the sunvisor arm support bracket to the headliner and the roof panel.

HEADLINER

The upper trim moldings and the headliner are attached to the roof rail with a combination of screws, clip retainers and rail retainers (Fig. 83).

To remove a headliner, all of the upper trim moldings must be removed from the perimeter of the headliner along with (as applicable):

- Assist handles.
- Sunvisors.
- Dome/cargo lamps.
- Overhead console.
- All other attached/overlapping components.

REMOVAL AND INSTALLATION (Continued)

Refer to the appropriate removal and installation procedure locate in this section or in Group 8, Electrical.

REMOVAL

CAUTION: The headliner is a one-piece, molded component (Fig. 84). It has limited flexibility and must not be bent during removal/installation.

- (1) Remove the upper trim moldings from the perimeter of the headliner (Fig. 85).
- (2) Ensure that all the retainer clips and screws are disengaged before removing the headliner.
- (3) Disengage tabs attaching headliner/speaker structure to roof rail, if equipped (Fig. 84).
- (4) Disengage rear speaker harness connector, if equipped.

Fig. 84 Headliner

- 1 - TAB
- 2 - SPEAKER
- 3 - GRILLE
- 4 - CARGO LAMP
- 5 - HEADLINER

INSTALLATION

- (1) Engage tabs attaching headliner/speaker structure to roof rail, if equipped. (Fig. 84)
- (2) On vehicles without headliner speakers, ensure that the retainer clips on upper liftgate opening trim and rails are installed. (Fig. 86)
- (3) Engage rear speaker harness connector.
- (4) Install the upper trim moldings around the perimeter of the headliner. Tighten the retaining screws to 1 N·m (11 in. lbs.) torque.
- (5) As applicable, install:
 - Assist handles.
 - Sunvisors.
 - Dome/cargo lamps.
 - Overhead console.

LIFTGATE TRIM PANEL

REMOVAL

- (1) Using a small flat blade, pry out the trim plugs from the liftgate assist handle.
- (2) Remove the screws attaching the assist handle to the liftgate (Fig. 87).

REMOVAL AND INSTALLATION (Continued)

(3) Remove the screws that attach the liftgate trim panel to the liftgate.

(4) Using a trim panel removal tool, detach the push-in fasteners from the liftgate.

(5) Remove the trim panel from the liftgate.

80abd2e1

Fig. 87 Liftgate Trim Panel

- 1 - TRIM PANEL
- 2 - PUSH NUT
- 3 - LIFTGATE
- 4 - ASSIST HANDLE
- 5 - PLUG

INSTALLATION

(1) Position the trim panel on liftgate.

(2) Using new push-in fasteners, align the push-in fasteners with the holes in the liftgate inner panel and press the trim panel into place.

(3) Install the screws to attach the liftgate trim panel to the liftgate.

(4) Install the screws attaching the assist handle to the liftgate.

(5) Press the trim plugs into the liftgate assist handle.

LIFTGATE

REMOVAL

WARNING: DO NOT DISCONNECT SUPPORT ROD CYLINDERS WITH LIFTGATE CLOSED. SUPPORT ROD PISTONS ARE OPERATED BY HIGH PRESSURE GAS. THIS COULD CAUSE DAMAGE AND/OR PERSONAL INJURY IF THEY ARE REMOVED WHILE PISTONS ARE COMPRESSED.

(1) Remove center high mounted stop lamp (CHMSL).

(2) Open and support liftgate.

(3) Remove liftgate trim panel.

(4) Disconnect and plug backlite washer fluid supply line.

(5) Remove screws that attach rear wiper and liftgate power lock wire harness connectors to liftgate and disconnect connectors.

(6) Using access hole created by removal of CHMSL, route backlite washer fluid supply line and rear wiper and liftgate power lock wire harness/grommets through access hole and separate from liftgate.

(7) Remove retainer clips that secure support rods to ball studs.

(8) Remove support rods from ball studs.

(9) Remove bolts attaching hinges to liftgate.

(10) Remove liftgate from vehicle.

INSTALLATION

(1) Position and support liftgate at opening in body and install bolts attaching hinges to liftgate. Tighten bolts to 26 N·m (19 ft. lbs.) torque.

(2) Connect liftgate support rods to ball studs and install retainer clips.

(3) Route backlite washer fluid supply line and rear wiper and liftgate power lock wire harnesses/grommets through access hole.

(4) Connect connectors and install screws that attach rear wiper and liftgate power lock wire harness connectors to liftgate.

(5) Unplug and connect backlite washer fluid supply line.

(6) Install liftgate trim panel.

(7) Remove supports and close liftgate.

(8) Install (CHMSL).

LIFTGATE HINGE

REMOVAL

It is not necessary to remove the liftgate to replace one or both hinges.

(1) Open and support the liftgate.

(2) Remove the liftgate opening upper trim.

(3) Remove the bolts attaching the hinge to the header panel (Fig. 88).

(4) Remove the bolts attaching the hinge to the liftgate.

REMOVAL AND INSTALLATION (Continued)

Fig. 88 Liftgate Hinge

- 1 - LIFTGATE HINGE
- 2 - LIFTGATE
- 3 - HEADER PANEL
- 4 - HEADER PANEL

INSTALLATION

- (1) Position the hinge on the liftgate.
- (2) Install the bolts attaching the hinge to the liftgate. Tighten to 26 N·m (19 ft. lbs.) torque.
- (3) Install the bolts attaching the hinge to the header panel. Tighten to 26 N·m (19 ft. lbs.) torque.
- (4) Install the liftgate opening upper trim.
- (5) Remove the support and close the liftgate.

LIFTGATE SUPPORT ROD CYLINDER

REMOVAL

WARNING: DO NOT REMOVE A SUPPORT ROD CYLINDER WITH THE LIFTGATE CLOSED. EACH SUPPORT ROD PISTON IS OPERATED BY HIGH PRESSURE GAS. IT CAN CAUSE DAMAGE AND/OR PERSONAL INJURY IF IT IS REMOVED WITH THE PISTON COMPRESSED. DO NOT ATTEMPT TO DISASSEMBLE OR REPAIR A SUPPORT ROD CYLINDER.

- (1) Open the liftgate.
- (2) Support the liftgate in the open position.
- (3) Remove the clip attaching the support rod to the ball stud.
- (4) Disconnect the support rod from the ball stud.
- (5) Remove the bolts attaching the support rod to the liftgate (Fig. 89).
- (6) Separate the support rod from the liftgate.

INSTALLATION

- (1) Position the support rod on the liftgate.

Fig. 89 Liftgate Support Rod

- 1 - LIFTGATE
- 2 - SUPPORT ROD CYLINDER
- 3 - WASHER
- 4 - BALL STUD

- (2) Install the bolts attaching the support rod to the liftgate.
- (3) Connect the support rod to the ball stud.
- (4) Secure the support rod to the ball stud with the retainer clip.
- (5) Remove the support from the liftgate.

LIFTGATE SUPPORT ROD BALL STUD

REMOVAL

- (1) Open the liftgate.
- (2) Support the liftgate in the open position.
- (3) Remove the retainer clip attaching the support rod to the ball stud.
- (4) Disconnect the support rod from the ball stud.
- (5) Remove the ball stud.

INSTALLATION

- (1) Install the replacement ball stud.
- (2) Connect the support rod to the ball stud.
- (3) Secure the support rod to the ball stud with the clip.
- (4) Remove the support from the liftgate.

LIFTGATE OUTSIDE HANDLE

REMOVAL

- (1) Remove liftgate trim panel.
- (2) Disconnect liftgate actuator linkages.
- (3) Disconnect liftgate outside handle to latch rod.
- (4) Remove nut attaching outside handle to liftgate (Fig. 90).
- (5) Separate outside handle from liftgate.
- (6) If necessary, remove lock cylinder (Fig. 91).

REMOVAL AND INSTALLATION (Continued)

- 6 - ACTUATOR TO LIFTGATE LOCK ROD

80aa0fef

Fig. 91 Liftgate Lock Cylinder

- 1 - CLIP
- 2 - OUTSIDE HANDLE
- 3 - LOCK CYLINDER

INSTALLATION

- (1) If necessary, install lock cylinder.
- (2) Position outside handle on liftgate.
- (3) Install nut attaching outside handle to liftgate.
- (4) Connect liftgate outside handle to latch rod.
- (5) Connect liftgate actuator linkages.
- (6) Install liftgate trim panel.

LIFTGATE LOCK CYLINDER

For service procedures, refer to the Liftgate Outside Handle Removal/Installation procedures.

LIFTGATE LATCH**REMOVAL**

- (1) Raise liftgate.
- (2) Remove liftgate trim panel.
- (3) Remove screws attaching latch to liftgate (Fig. 92).
- (4) Disconnect rod from latch.
- (5) Disconnect power lock connector from handle, if equipped.
- (6) Remove latch from liftgate.

80aa0fed

Fig. 92 Liftgate Latch

- 1 - POWER ACTUATOR
- 2 - LIFTGATE LOCK
- 3 - OUTSIDE HANDLE
- 4 - OUTSIDE HANDLE TO LATCH ROD
- 5 - LIFTGATE LATCH
- 6 - ACTUATOR TO LIFTGATE LOCK ROD

INSTALLATION

- (1) Position latch in liftgate.
- (2) Connect power lock connector to handle, if equipped.
- (3) Connect latch rod.
- (4) Install screws attaching latch to liftgate. Tighten screws to 13 N·m (9 ft. lbs.) torque.
- (5) Install liftgate trim panel.

LIFTGATE LATCH STRIKER**REMOVAL**

- (1) From underside of vehicle, remove nuts attaching striker to floor pan (Fig. 93).
- (2) Separate striker from vehicle.

INSTALLATION

- (1) Position striker on vehicle.
- (2) Install nuts. Tighten nuts to 54 N·m (40 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

Fig. 93 Liftgate Striker

- 1 - OVERSLAM BUMPER
- 2 - STRIKER PLATE
- 3 - STRIKER
- 4 - SHIM

LIFTGATE WEATHERSTRIP

REMOVAL

- (1) Pull the seal away from the flange around the perimeter of liftgate opening and remove it.
- (2) Clean the flange as necessary.

INSTALLATION

- (1) Position weatherstrip seal in the opening with the left end of the seal at the opening centerline. Install the seal in a clockwise direction.
- (2) Move to the left and mate the seal with the bottom-left flange (Fig. 94).
- (3) Move upward and mate the seal with the left-side flange.
- (4) Move to the right and mate the seal with the top-left roof flange.
- (5) Seat the installed part of the seal with a roller. Move the roller from the left-bottom end of seal to the top-left half of the seal.
- (6) Move to the right and mate the seal with the top-right roof flange.
- (7) Move downward and mate the seal with the right-side flange.
- (8) Move to the left and mate the seal with the bottom-right flange.
- (9) Center and butt seal the ends together at the centerline.
- (10) Seat the remaining part of the seal with a roller. Move the roller from the top-left half of the seal to the right-bottom end of the seal.

Fig. 94 Liftgate Weatherstrip Installation

- 1 - LIFTGATE OPENING
- 2 - WEATHERSTRIP SEAL

ADJUSTMENTS

HOOD

The hood bolt holes are elongated for fore and aft and side-to-side adjustment.

- (1) If hood is low to the cowl panel, insert shims between the hinge and hood at the rear hinge bolts.
- (2) Adjust the hood bumper (Fig. 95) in or out to provide proper hood-to-fender height alignment.
- (3) Adjust the hood strikers (Fig. 96) with shims as necessary. Tighten the screws to 22 N·m (16 ft-lbs) torque after adjustment.
- (4) Align each latch and striker so that the striker enters latch squarely.

DOOR

IN AND OUT—MINOR ADJUSTMENT

- (1) Loosen the latch striker.
- (2) Tap the latch striker inward if the door character line is outboard of the body character line or tap the latch striker outward if the door character line is inboard of the body character line.
- (3) Inspect alignment. If correct, tighten striker with 28 N·m (20 ft. lbs.) torque.

ADJUSTMENTS (Continued)

J9223-75

Fig. 95 Hood Bumper

- 1 - HOOD LATCH STRIKER REINFORCEMENT PANEL
2 - HOOD BUMPER

J9223-76

Fig. 96 Hood Latch Striker

- 1 - RADIATOR SUPPORT CROSSMEMBER
2 - SCREW
3 - RADIATOR BAFFLE
4 - SHIM
5 - HOOD LATCH STRIKER
6 - SCREW

UP AND DOWN—MINOR ADJUSTMENT

- (1) Loosen the latch striker.
- (2) Tap the latch striker downward if the door character line is higher than the body character line or tap the latch striker upward if the door character line is lower than the body character line.
- (3) Inspect alignment. If correct, tighten striker with 28 N·m (20 ft. lbs.) torque.

ALIGNMENT MAJOR—ADJUSTMENT

Adjustment for alignment of the door is made by installing shims between hinge and door face (Fig. 97).

80b8994e

Fig. 97 Door Adjustment Shims

- 1 - ADJUSTMENT SHIMS

- (1) If not loosened, loosen the door hinge bolts.
- (2) Add or remove shims as necessary to obtain the best door fit.
- (3) Tighten door hinge bolts to 3 N·m (2 ft-lbs) torque after adjustment is completed.
- (4) Apply general purpose sealant around the door hinges/door face mating area.

DOOR LATCH ADJUSTMENT

- (1) Locate access hole (Fig. 98).
- (2) Insert a 5/32-inch hex-wrench through hole and into adjustment screw. Loosen screw.
- (3) Operate outside handle button several times to release any restriction because of mis-alignment.
- (4) Tighten adjustment screw to 3 N·m (30 in-lbs) torque.
- (5) Test handle button and lock cylinder for proper operation.

ADJUSTMENTS (Continued)

**Fig. 98 Door Latch Adjustment**

- 1 - ACCESS HOLE
 2 - DOOR
 3 - LATCH MOUNTING BOLTS
 4 - LATCH

LIFTGATE

The position of liftgate can be adjusted upward or downward by use of slots in the hinge. An inward or outward adjustment is achieved by use of slots in the body. If an inward or outward adjustment is needed, use 3M[®] Fast and Firm or equivalent on the hinge to body mating surface as a sealant.

REAR SEATBACK

- (1) Unlatch and position seatback in cargo position.
- (2) Loosen the screws attaching the strikers to the rear wheelhouse.
- (3) Position the seat back in the full upright position and secure the latch into the strikers.
- (4) From the cargo area of the vehicle, push the rear of the seatback forward.
- (5) Unlatch and position seatback in cargo position.
- (6) Tighten the screws attaching the strikers to the rear wheelhouse.
- (7) Position the seat back in the full upright position and secure the latch into the strikers.
- (8) Verify latch operation.

DESCRIPTION AND OPERATION

ACCUMULATOR

DESCRIPTION

The accumulator is mounted in the engine compartment between the evaporator coil outlet tube and the compressor inlet.

OPERATION

Refrigerant enters the accumulator canister as a low pressure vapor through the inlet tube. Any liquid, oil-laden refrigerant falls to the bottom of the canister, which acts as a separator. A desiccant bag is mounted inside the accumulator canister to absorb any moisture which may have entered and become trapped within the refrigerant system (Fig. 1).

BLOWER MOTOR

DESCRIPTION

The blower motor and blower wheel are located in the passenger side end of the heater-A/C housing, below the glove box. The blower motor controls the velocity of air flowing through the heater-A/C housing by spinning a squirrel cage-type blower wheel within the housing at the selected speed. The blower motor and wheel can be removed through an opening in the engine compartment side of the dash panel without heater-A/C housing removal.

OPERATION

The blower motor will only operate when the ignition switch is in the On position, and the heater-A/C mode control switch knob is in any position, except Off. The blower motor receives a fused battery feed through the blower motor relay whenever the ignition switch is in the On position. The blower motor battery feed circuit is protected by a fuse in the Power Distribution Center (PDC). Blower motor speed is controlled by regulating the ground path through the heater-A/C control blower motor switch and the blower motor resistor.

The blower motor and blower motor wheel cannot be repaired and, if faulty or damaged, they must be replaced. The blower motor and blower wheel are serviced only as a unit.

BLOWER MOTOR RELAY

DESCRIPTION

The blower motor relay is a International Standards Organization (ISO)-type relay. The relay is an electromechanical device that switches battery current from a fuse in the Power Distribution Center (PDC) directly to the blower motor. The relay is energized when the relay coil is provided a voltage signal by the ignition switch. See Blower Motor Relay in the Diagnosis and Testing section of this group for more information.

OPERATION

The blower motor relay is installed in a wire harness connector that is secured to the passenger side outboard end of the heater-A/C housing in the passenger compartment, next to the heater-A/C wire harness connector.

The blower motor relay cannot be repaired and, if faulty or damaged, it must be replaced.

DESCRIPTION AND OPERATION (Continued)

BLOWER MOTOR RESISTOR**DESCRIPTION**

The blower motor resistor is mounted to the bottom of the heater-A/C housing on the passenger side of the vehicle under the instrument panel. It can be accessed for service by removing the heater-A/C housing kick cover.

OPERATION

The resistor has multiple resistor wires, each of which reduce the current flow to the blower motor, to change the blower motor speed. The blower motor switch directs the ground path through the correct resistor wire to obtain the selected speed. When the highest blower speed is selected, the blower motor switch connects the blower motor directly to ground, bypassing the blower motor resistor.

The blower motor resistor cannot be repaired and, if faulty or damaged, it must be replaced.

BLOWER MOTOR SWITCH**DESCRIPTION**

The heater-only or heater-A/C blower motor is controlled by a four position rotary-type blower motor switch, mounted in the heater-A/C control panel. The switch allows the selection of one of four blower motor speeds, but can only be turned off by selecting the Off position with the heater-A/C mode control switch knob.

OPERATION

The blower motor switch directs the blower motor ground path through the mode control switch to the blower motor resistor, or directly to ground, as required to achieve the selected blower motor speed.

The blower motor switch cannot be repaired and, if faulty or damaged, the entire heater-only or heater-A/C control unit must be replaced.

COMPRESSOR**DESCRIPTION**

The air conditioning system uses a Sanden SD7H15 seven cylinder, reciprocating wobble plate-type compressor on all models. This compressor has a fixed displacement of 150 cubic centimeters (9.375 cubic inches), and has both the suction and discharge ports located on the cylinder head. A label identifying the use of R-134a refrigerant is located on the compressor.

OPERATION

The compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement.

The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be replaced. The compressor clutch, pulley and clutch coil are available for service.

COMPRESSOR CLUTCH**DESCRIPTION**

The compressor clutch assembly consists of a stationary electromagnetic coil, a hub bearing and pulley assembly, and a clutch plate (Fig. 2). The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is keyed to the compressor shaft and secured with a nut. These components provide the means to engage and disengage the compressor from the engine serpentine accessory drive belt.

J9524-33

Fig. 2 Compressor Clutch - Typical

- 1 - CLUTCH PLATE

- 5 - CLUTCH SHIMS
- 6 - SNAP RING
- 7 - SNAP RING

OPERATION

When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub.

DESCRIPTION AND OPERATION (Continued)

bearing, which is part of the pulley. The compressor clutch and coil are the only serviced parts on the compressor.

The compressor clutch engagement is controlled by several components: the heater-A/C mode control switch, the low pressure cycling clutch switch, the high pressure cut-off switch, the compressor clutch relay, and the Powertrain Control Module (PCM). The PCM may delay compressor clutch engagement for up to thirty seconds. Refer to Group 14 - Fuel System for more information on the PCM controls.

COMPRESSOR CLUTCH RELAY

DESCRIPTION

The compressor clutch relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (footprint) is different, the current capacity is lower, and the relay case dimensions are smaller than those of the conventional ISO relay.

The compressor clutch relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

OPERATION

The compressor clutch relay is a electromechanical device that switches battery current to the compressor clutch coil when the Powertrain Control Module (PCM) grounds the coil side of the relay. The PCM responds to inputs from the heater-A/C mode control switch, the low pressure cycling clutch switch, and the high pressure cut-off switch. See Compressor Clutch Relay in the Diagnosis and Testing section of this group for more information.

The compressor clutch relay cannot be repaired and, if faulty or damaged, it must be replaced.

CONDENSER

DESCRIPTION

The condenser is located in the air flow in front of the engine cooling radiator. The condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the compressor to give up its heat to the air passing over the condenser fins.

OPERATION

When the refrigerant gas gives up its heat, it condenses. When the refrigerant leaves the condenser, it has become a high-pressure liquid refrigerant. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the air conditioning system. Therefore, it is important that

there are no objects placed in front of the radiator grille openings in the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or condenser service.

The condenser cannot be repaired and, if faulty or damaged, it must be replaced.

DUAL FUNCTION HIGH PRESSURE SWITCH (4.0 L)

DESCRIPTION

The Dual Function High Pressure Switch controls both A/C clutch engagement/disengagement, and electric cooling fan operations. The switch is located on the discharge line near the compressor. The switch is screwed onto a fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The discharge line fitting is equipped with an O-ring to seal the switch connection.

OPERATION

The dual function switch is connected in series electrically with the low pressure cycling clutch switch between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This prevents compressor operation when the discharge line pressure approaches high levels, and also reduces electrical surging from compressor clutch engagement.

The dual function switch controls the electric cooling fan operation by monitoring refrigerant line pressures. When the discharge line pressure rises above 1900 to 2200 kPa (280 to 320 psi) the fan will turn on. The cooling fan will turn off when the discharge line pressure drops to 1600 kPa (235 psi).

The dual function switch controls the A/C clutch operation by disengaging the clutch when the discharge line pressure rises above 3100 to 3375 kPa (450 to 490 psi). The switch contacts will close and allow A/C clutch engagement when the discharge line pressure drops to 1860 to 2275 kPa (270 to 330 psi).

The Dual Function High Pressure Switch is a factory-calibrated unit. The switch cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

EVAPORATOR COIL

DESCRIPTION

The evaporator coil is located in the heater-A/C housing, under the instrument panel. The evaporator coil is positioned in the heater-A/C housing so that

DESCRIPTION AND OPERATION (Continued)

all air that enters the housing must pass over the fins of the evaporator before it is distributed through the system ducts and outlets. However, air passing over the evaporator coil fins will only be conditioned when the compressor is engaged and circulating refrigerant through the evaporator coil tubes.

OPERATION

Refrigerant enters the evaporator from the fixed orifice tube as a low-temperature, low-pressure liquid. As air flows over the fins of the evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the evaporator.

The evaporator coil cannot be repaired and, if faulty or damaged, it must be replaced.

FIXED ORIFICE TUBE

DESCRIPTION

The fixed orifice tube is installed in the liquid line (left-hand drive) or liquid line jumper (right-hand drive) between the outlet of the condenser and the inlet of the evaporator. The fixed orifice tube is located in the end of the liquid line or liquid line jumper that is closest to the condenser outlet tube.

The inlet end of the fixed orifice tube has a nylon mesh filter screen, which filters the refrigerant and helps to reduce the potential for blockage of the metering orifice by refrigerant system contaminants (Fig. 3). The outlet end of the tube has a nylon mesh diffuser screen. The O-rings on the plastic body of the fixed orifice tube seal the tube to the inside of the liquid line and prevent the refrigerant from bypassing the fixed metering orifice.

Fig. 3 Fixed Orifice Tube - Typical

- 1 - DIFFUSER SCREEN
- 2 - "O" RINGS
- 3 - INLET FILTER SCREEN
- 4 - ORIFICE

OPERATION

The fixed orifice tube is used to meter the flow of liquid refrigerant into the evaporator coil. The high-

pressure liquid refrigerant from the condenser expands into a low-pressure liquid as it passes through the metering orifice and diffuser screen of the fixed orifice tube.

The fixed orifice tube cannot be repaired and, if faulty or plugged, the liquid line and fixed orifice tube unit or liquid line jumper and fixed orifice tube unit must be replaced.

HEATER AND AIR CONDITIONER

DESCRIPTION

All vehicles are equipped with a common heater-A/C housing assembly (Fig. 4). The system combines air conditioning, heating, and ventilating capabilities in a single unit housing mounted under the instrument panel. On heater-only systems, the evaporator coil and recirculating air door are omitted from the housing.

Fig. 4 Common Blend-Air Heater-Air Conditioner System - Typical

- 1 - HEATER CORE
- 2 - BLEND-AIR DOOR
- 3 - EVAPORATOR A/C ONLY
- 4 - RECIRCULATING AIR DOOR A/C ONLY
- 5 - FLOOR/PANEL DOOR
- 6 - FLOOR/DEFROST DOOR

Outside fresh air enters the vehicle through the cowl top opening at the base of the windshield, and passes through a plenum chamber to the heater-A/C system blower housing. Air flow velocity can then be adjusted with the blower motor speed selector switch on the heater-A/C control panel. The air intake openings must be kept free of snow, ice, leaves, and other obstructions for the heater-A/C system to receive a sufficient volume of outside air.

It is also important to keep the air intake openings clear of debris because leaf particles and other debris that is small enough to pass through the cowl plenum screen can accumulate within the heater-A/C housing. The closed, warm, damp and dark environment created within the heater-A/C housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter

DESCRIPTION AND OPERATION (Continued)

provides an additional food source for fungal spores, which enter the housing with the fresh air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C system operation.

OPERATION

The heater and optional air conditioner are blend-air type systems. In a blend-air system, a blend-air door controls the amount of unconditioned air (or cooled air from the evaporator on models with air conditioning) that is allowed to flow through, or around, the heater core. A temperature control knob on the heater-A/C control panel determines the discharge air temperature by controlling an electric motor, which moves the blend-air door. This allows an almost immediate control of the output air temperature of the system.

The mode control knob on the heater-only or heater-A/C control panel is used to direct the conditioned air to the selected system outlets. Both mode control switches use engine vacuum to control the mode doors, which are operated by vacuum actuator motors.

On air conditioned vehicles, the outside air intake can be shut off by selecting the Recirculation Mode with the mode control knob. This will operate a vacuum actuated recirculating air door that closes off the outside fresh air intake and recirculates the air that is already inside the vehicle.

The optional air conditioner for all models is designed for the use of non-CFC, R-134a refrigerant. The air conditioning system has an evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. This air conditioning system uses a fixed orifice tube in the liquid line near the condenser outlet tube to meter refrigerant flow to the evaporator coil. To maintain minimum evaporator temperature and prevent evaporator freezing, a fixed pressure setting switch on the accumulator cycles the compressor clutch.

HEATER AND AIR CONDITIONER CONTROL**DESCRIPTION**

Both the heater-only and heater-A/C systems use a combination of mechanical, electrical, and vacuum controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle. Refer to the owner's manual in the vehicle glove box for more information on the features, use, and suggested operation of these controls.

OPERATION

The heater-only or heater-A/C control panel is located to the right of the instrument cluster on the instrument panel. The control panel contains a rotary-type temperature control knob, a rotary-type mode control switch knob, and a rotary-type blower motor speed switch knob.

The heater-only or heater-A/C control panel cannot be repaired. If faulty or damaged, the entire unit must be replaced. The illumination lamps are available for service replacement.

HEATER CORE**DESCRIPTION**

The heater core is located in the heater-A/C housing, under the instrument panel. It is a heat exchanger made of rows of tubes and fins.

OPERATION

Engine coolant is circulated through heater hoses to the heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and tubes. Air directed through the heater core picks up the heat from the heater core fins. The blend air door allows control of the heater output air temperature by controlling how much of the air flowing through the heater-A/C housing is directed through the heater core. The blower motor speed controls the volume of air flowing through the heater-A/C housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced. Refer to Group 7 - Cooling System for more information on the engine cooling system, the engine coolant and the heater hoses.

HIGH PRESSURE CUT-OFF SWITCH**DESCRIPTION**

The high pressure cut-off switch is located on the discharge line between the compressor and the condenser inlet. The switch is screwed onto a fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The discharge line fitting is equipped with an O-ring to seal the switch connection.

OPERATION

The high pressure cut-off switch is connected in series electrically with the low pressure cycling clutch switch between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This prevents compressor operation when the discharge line pressure approaches high levels.

DESCRIPTION AND OPERATION (Continued)

The high pressure cut-off switch contacts are open when the discharge line pressure rises above 3100 to 3375 kPa (450 to 490 psi). The switch contacts will close when the discharge line pressure drops to 1860 to 2275 kPa (270 to 330 psi).

The high pressure cut-off switch is a factory-calibrated unit. The switch cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

HIGH PRESSURE RELIEF VALVE

DESCRIPTION

A high pressure relief valve is located on the compressor manifold, which is on the side of the compressor. This mechanical valve is designed to vent refrigerant from the system to protect against damage to the compressor and other system components, caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

The high pressure relief valve vents the system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The valve closes when a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the system. If the valve vents refrigerant, it does not mean that the valve is faulty.

The high pressure relief valve is a factory-calibrated unit. The valve cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the compressor assembly.

LOW PRESSURE CYCLING CLUTCH SWITCH

DESCRIPTION

The low pressure cycling clutch switch is located on the top of the accumulator. The switch is screwed onto an accumulator fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The accumulator fitting is equipped with an O-ring to seal the switch connection.

OPERATION

The low pressure cycling clutch switch is connected in series electrically with the high pressure cut-off switch, between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This regulates the refrigerant system pres-

sure and controls evaporator temperature. Controlling the evaporator temperature prevents condensate water on the evaporator fins from freezing and obstructing air conditioning system air flow.

The low pressure cycling clutch switch contacts are open when the suction pressure is approximately 141 kPa (20.5 psi) or lower. The switch contacts will close when the suction pressure rises to approximately 234 to 262 kPa (34 to 38 psi) or above. Lower ambient temperatures, below approximately -1° C (30° F), will also cause the switch contacts to open. This is due to the pressure/temperature relationship of the refrigerant in the system.

The low pressure cycling clutch switch is a factory-calibrated unit. It cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REFRIGERANT

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

REFRIGERANT LINES

DESCRIPTION

The refrigerant lines and hoses are used to carry the refrigerant between the various air conditioning

DESCRIPTION AND OPERATION (Continued)

system components. A barrier hose design with a nylon tube, which is sandwiched between rubber layers, is used for the R-134a air conditioning system on this vehicle. This nylon tube helps to further contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant hoses are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

OPERATION

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled with other components of the HVAC system with peanut-block style fittings. A stat-O seal type flat steel gasket with a captured compressible O-ring, is used to mate plumbing lines with A/C components to ensure the integrity of the refrigerant system.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

REFRIGERANT LINE COUPLERS

DESCRIPTION

Spring-lock type refrigerant line couplers are used to connect many of the refrigerant lines and other components to the refrigerant system. These couplers require a special tool for disengaging the two coupler halves.

OPERATION

The spring-lock coupler is held together by a garter spring inside a circular cage on the male half of the fitting (Fig. 5). When the two coupler halves are connected, the flared end of the female fitting slips behind the garter spring inside the cage on the male fitting. The garter spring and cage prevent the flared end of the female fitting from pulling out of the cage.

Two O-rings on the male half of the fitting are used to seal the connection. These O-rings are com-

80a7e303

Fig. 5 Spring-Lock Coupler - Typical

- 1 - MALE HALF SPRING-LOCK COUPLER
- 2 - FEMALE HALF SPRING-LOCK COUPLER
- 3 - SECONDARY CLIP
- 4 - CONNECTION INDICATOR RING
- 5 - COUPLER CAGE
- 6 - GARTER SPRING
- 7 - COUPLER CAGE
- 8 - "O" RINGS

patible with R-134a refrigerant and must be replaced with O-rings made of the same material.

Secondary clips are installed over the two connected coupler halves at the factory for added blowoff protection. In addition, some models have a plastic ring that is used at the factory as a visual indicator to confirm that these couplers are connected. After the coupler is connected, the plastic indicator ring is no longer needed; however, it will remain on the refrigerant line near the coupler cage.

REFRIGERANT OIL

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The 10PA17 compressor used in this vehicle is designed to use an ND-8 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant

DESCRIPTION AND OPERATION (Continued)

oil can cause compressor damage, and too much can reduce air conditioning system performance.

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

REFRIGERANT SYSTEM SERVICE PORT**DESCRIPTION**

The two refrigerant system service ports are used to charge, recover/recycle, evacuate, and test the air conditioning refrigerant system. Unique service port coupler sizes are used on the R-134a system, to ensure that the refrigerant system is not accidentally contaminated by the use of the wrong refrigerant (R-12), or refrigerant system service equipment.

OPERATION

The high pressure service port is located on the refrigerant line, near the discharge port of the compressor. The low pressure service port is located on the liquid line at the rear of the engine compartment, near the evaporator inlet tube.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. After servicing the refrigerant system, always reinstall both of the service port caps.

VACUUM CHECK VALVE**DESCRIPTION**

A vacuum check valve is installed in the accessory vacuum supply line in the engine compartment, near the vacuum tap on the engine intake manifold, and at the HVAC unit takeout. The vacuum check valve is designed to allow vacuum to flow in only one direction through the accessory vacuum supply circuits.

OPERATION

The use of a vacuum check valve helps to maintain the system vacuum needed to retain the selected heater-A/C mode settings. The check valve will prevent the engine from bleeding down system vacuum through the intake manifold during extended heavy engine load (low engine vacuum) operation.

The vacuum check valve cannot be repaired and, if faulty or damaged, it must be replaced.

VACUUM RESERVOIR**DESCRIPTION**

The vacuum reservoir is mounted to the front bumper bar behind the passenger side bumper end cap. The bumper end cap must be removed from the vehicle to access the vacuum reservoir for service.

OPERATION

Engine vacuum is stored in the vacuum reservoir. The stored vacuum is used to operate the vacuum-controlled vehicle accessories during periods of low engine vacuum such as when the vehicle is climbing a steep grade, or under other high engine load operating conditions.

The vacuum reservoir cannot be repaired and, if faulty or damaged, it must be replaced.

DIAGNOSIS AND TESTING**A/C PERFORMANCE**

The air conditioning system is designed to provide the passenger compartment with low temperature and low humidity air. The evaporator, located in the heater-A/C housing on the dash panel below the instrument panel, is cooled to temperatures near the freezing point. As warm damp air passes through the cooled evaporator, the air transfers its heat to the refrigerant in the evaporator and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an air conditioning system will be more effective in the Recirculation Mode. With the system in the Recirculation Mode, only air from the passenger compartment passes through the evaporator. As the passenger compartment air dehumidifies, the air conditioning system performance levels improve.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the air conditioning system. When humidity is high, the evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and tubing. This reduces the amount of heat the evaporator can absorb from the air. High humidity greatly reduces the ability of the evaporator to lower the temperature of the air.

DIAGNOSIS AND TESTING (Continued)

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their air conditioning system on humid days. A performance test is the best way to determine whether the system is performing up to standard. This test also provides valuable clues as to the possible cause of trouble with the air conditioning system.

Review the Service Warnings and Precautions in the front of this group before performing this procedure. The air temperature in the test room and in the vehicle must be a minimum of 21° C (70° F) for this test.

(1) Connect a tachometer and a manifold gauge set.

(2) Set the heater-A/C mode control switch knob in the Recirculation Mode position, the temperature control knob in the full cool position, and the blower motor switch knob in the highest speed position.

(3) Start the engine and hold the idle at 1,000 rpm with the compressor clutch engaged.

(4) The engine should be at operating temperature. The doors and windows must be open.

(5) Insert a thermometer in the driver side center A/C (panel) outlet. Operate the engine for five minutes.

(6) The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, unplug the low pressure cycling clutch switch wire harness connector from the switch

located on the accumulator (Fig. 6). Place a jumper wire across the terminals of the low pressure cycling clutch switch wire harness connector.

80add30d

Fig. 6 Low Pressure Cycling Clutch Switch - Typical

1 - LOW PRESSURE CYCLING CLUTCH SWITCH
2 - ACCUMULATOR

(7) With the compressor clutch engaged, record the discharge air temperature and the compressor discharge pressure.

(8) Compare the discharge air temperature to the Performance Temperature and Pressure chart. If the discharge air temperature is high, see Refrigerant System Leaks and Refrigerant System Charge in this group.

Performance Temperature and Pressure					
Ambient Air Temperature	21° C (70° F)	27° C (80° F)	32° C (90° F)	38° C (100° F)	43° C (110° F)
Air Temperature at Center Panel Outlet	-3 to 3° C (27 to 38° F)	1 to 7° C (33 to 44° F)	3 to 9° C (37 to 48° F)	6 to 13° C (43 to 55° F)	10 to 18° C (50 to 64° F)
Evaporator Inlet Pressure at Charge Port	179 to 241 kPa (26 to 35 psi)	221 to 283 kPa (32 to 41 psi)	262 to 324 kPa (38 to 47 psi)	303 to 365 kPa (44 to 53 psi)	345 to 414 kPa (50 to 60 psi)
Compressor Discharge Pressure	1240 to 1655 kPa (180 to 240 psi)	1380 to 1790 kPa (200 to 260 psi)	1720 to 2070 kPa (250 to 300 psi)	1860 to 2345 kPa (270 to 340 psi)	2070 to 2690 kPa (300 to 390 psi)

(9) Compare the compressor discharge pressure to the Performance Temperature and Pressure chart. If the compressor discharge pressure is high, see the Pressure Diagnosis chart.

DIAGNOSIS AND TESTING (Continued)

Pressure Diagnosis		
Condition	Possible Causes	Correction
Rapid compressor clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system. 2. Faulty fuse. 3. Faulty compressor clutch coil. 4. Faulty compressor clutch relay. 5. Improperly installed or faulty low pressure cycling clutch switch. 6. Faulty high pressure cut-off switch. 7. Faulty Powertrain Control Module (PCM).	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 2. Check the fuses in the Power Distribution Center and the junction block. Repair the shorted circuit or component and replace the fuses, if required. 3. See Compressor Clutch Coil in this group. Test the compressor clutch coil and replace, if required. 4. See Compressor Clutch Relay in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required. 5. See Low Pressure Cycling Clutch Switch in this group. Test the low pressure cycling clutch switch and tighten or replace, if required. 6. See High Pressure Cut-Off Switch in this group. Test the high pressure cut-off switch and replace, if required. 7. Refer to the proper Diagnostic Procedures manual for testing of the PCM. Test the PCM and replace, if required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system. 2. Blend-Air door inoperative or sealing improperly. 3. Blend-Air door motor faulty or inoperative.	1. See Refrigerant Oil Level in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required. 2. See Blend-Air Door under Heater-A/C Housing Door in this group. Inspect the blend-air door for proper operation and sealing and correct, if required. 3. Perform Blend-Air door motor diagnosis, replace if faulty.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge. 2. Refrigerant flow through the accumulator is restricted. 3. Refrigerant flow through the evaporator coil is restricted. 4. Faulty compressor.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 2. See Accumulator in this group. Replace the restricted accumulator, if required. 3. See Evaporator Coil in this group. Replace the restricted evaporator coil, if required. 4. See Compressor in this group. Replace the compressor, if required.

DIAGNOSIS AND TESTING (Continued)

Pressure Diagnosis		
Condition	Possible Causes	Correction
The low side pressure is normal or slightly high, and the high side pressure is too high.	<ol style="list-style-type: none"> 1. Condenser air flow restricted. 2. Inoperative cooling fan. 3. Refrigerant system overcharged. 4. Air in the refrigerant system. 5. Engine overheating. 	<ol style="list-style-type: none"> 1. Check the condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Refer to Group 7 - Cooling System for more information on air seals. Clean, repair, or replace components as required. 2. Refer to Group 7 - Cooling System for more information. Test the cooling fan and replace, if required. 3. See Refrigerant System Charge in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required. 4. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 5. Refer to Group 7 - Cooling System for more information. Test the cooling system and repair, if required.
The low side pressure is too high, and the high side pressure is too low.	<ol style="list-style-type: none"> 1. Accessory drive belt slipping. 2. Fixed orifice tube not installed. 3. Faulty compressor. 	<ol style="list-style-type: none"> 1. Refer to Group 7 - Cooling System for more information. Inspect the accessory drive belt condition and tension. Tighten or replace the accessory drive belt, if required. 2. See Fixed Orifice Tube in this group. Install the missing fixed orifice tube, if required. 3. See Compressor in this group. Replace the compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	<ol style="list-style-type: none"> 1. Restricted refrigerant flow through the refrigerant lines. 2. Restricted refrigerant flow through the fixed orifice tube. 3. Restricted refrigerant flow through the condenser. 	<ol style="list-style-type: none"> 1. See Liquid Line and Suction and Discharge Line in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required. 2. See Fixed Orifice Tube in this group. Replace the restricted fixed orifice tube, if required. 3. See Condenser in this group. Replace the restricted condenser, if required.

BLOWER MOTOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams. Possible causes of an inoperative blower motor include:

- Faulty fuse
- Faulty blower motor circuit wiring or wire harness connectors
- Faulty blower motor resistor
- Faulty blower motor relay
- Faulty blower motor switch
- Faulty heater-A/C mode control switch
- Faulty blower motor.

Possible causes of the blower motor not operating in all speeds include:

- Faulty fuse
- Faulty blower motor switch
- Faulty blower motor resistor
- Faulty blower motor circuit wiring or wire harness connectors.

DIAGNOSIS AND TESTING (Continued)

VIBRATION

- Possible causes of blower motor vibration include:
- Improper blower motor mounting
 - Improper blower wheel mounting
 - Blower wheel out of balance or bent
 - Blower motor faulty.

NOISE

- To verify that the blower is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:
- Foreign material in the heater-A/C housing
 - Improper blower motor mounting
 - Improper blower wheel mounting
 - Blower motor faulty.

BLOWER MOTOR RELAY

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

RELAY TEST

The blower motor relay (Fig. 7) is located in a wire harness connector that is secured to the heater-A/C housing behind the glove box on the passenger side of the vehicle, next to the heater-A/C wire harness connector in the passenger compartment. Remove the relay from its connector to perform the following tests:

- (1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.
- (2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.
- (3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see the Relay Circuit Test procedure in this group. If not OK, replace the faulty relay.

RELAY CIRCUIT TEST

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

Fig. 7 Blower Motor Relay

- (1) The relay common feed terminal cavity (30) is connected to fused battery feed directly from a fuse in the Power Distribution Center (PDC), and should be hot at all times. Check for battery voltage at the connector cavity for relay terminal 30. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.
- (2) The relay normally closed terminal cavity (87A) is not used for this application. Go to Step 3.
- (3) The relay normally open terminal cavity (87) is connected to the blower motor. When the relay is energized, terminal 87 is connected to terminal 30 and provides full battery current to the blower motor feed circuit. There should be continuity between the connector cavity for terminal 87 and the blower motor relay output circuit cavity of the blower motor wire harness connector at all times. If OK, go to Step 4. If not OK, repair the open circuit to the blower motor as required.
- (4) The coil battery terminal cavity (86) is connected to the ignition switch. When the ignition switch is placed in the On position, fused ignition switch output is directed from a fuse in the junction block to the relay electromagnetic coil to energize the relay. There should be battery voltage at the connector cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the junction block fuse as required.
- (5) The coil ground terminal cavity (85) is connected to ground. This terminal supplies the ground for the relay electromagnetic coil. There should be continuity between the connector cavity for relay termi-

DIAGNOSIS AND TESTING (Continued)

nal 85 and a good ground at all times. If not OK, repair the open circuit as required.

BLOWER MOTOR RESISTOR

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the kick cover from the heater-A/C housing and unplug the wire harness connector from the blower motor resistor.

(3) Check for continuity between each of the blower motor switch input terminals of the resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor relay as required. If not OK, replace the faulty blower motor resistor.

BLOWER MOTOR SWITCH

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check for battery voltage at the fuse in the Power Distribution Center (PDC). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the heater-A/C control from the instrument panel. Check for continuity between the ground circuit cavity of the heater-A/C control wire harness connector and a good ground. There should be conti-

nunity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

(3) With the heater-A/C control wire harness connector unplugged, place the heater-A/C mode control switch knob in any position except the Off position. Check for continuity between the ground circuit terminal and each of the blower motor driver circuit terminals of the heater-A/C control as you move the blower motor switch knob to each of the four speed positions. There should be continuity at each driver circuit terminal in only one blower motor switch speed position. If OK, test and repair the blower driver circuits between the heater-A/C control connector and the blower motor resistor as required. If not OK, replace the faulty heater-A/C control unit.

COMPRESSOR

When investigating an air conditioning related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during air conditioning operation can often be misleading. For example: What sounds like a failed front bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets, or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon belt tension, belts can develop noises that are mistaken for a compressor noise. Improper belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the serpentine drive belt condition and tension as described in Group 7 - Cooling System before beginning this procedure.

(1) Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Switch the compressor on and off several times to clearly identify the compressor noise. Listen to the compressor while the clutch is engaged and disengaged. Probe the compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.

(2) Loosen all of the compressor mounting hardware and retighten. Tighten the compressor clutch mounting nut. Be certain that the clutch coil is mounted securely to the compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap. See Compressor and Compressor Clutch in the Removal and Installation section of this group for the procedures.

(3) To duplicate a high-ambient temperature condition (high head pressure), restrict the air flow through the condenser. Install a manifold gauge set

DIAGNOSIS AND TESTING (Continued)

to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).

(4) Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. See Suction and Discharge Line in the Removal and Installation section of this group for more information.

(5) If the noise is from opening and closing of the high pressure relief valve, evacuate and recharge the refrigerant system. See Refrigerant System Evacuate and Refrigerant System Charge in the Service Procedures section of this group. If the high pressure relief valve still does not seat properly, replace the compressor.

(6) If the noise is from liquid slugging on the suction line, replace the accumulator. See Accumulator in the Removal and Installation section of this group for the procedures. Check the refrigerant oil level and the refrigerant system charge. See Refrigerant Oil Level and Refrigerant System Charge in the Service Procedures section of this group. If the liquid slugging condition continues following accumulator replacement, replace the compressor.

(7) If the noise continues, replace the compressor and repeat Step 1.

COMPRESSOR CLUTCH COIL

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams. The battery must be fully-charged before performing the following tests. Refer to Group 8A - Battery for more information.

(1) Connect an ammeter (0 to 10 ampere scale) in series with the clutch coil terminal. Use a voltmeter (0 to 20 volt scale) with clip-type leads for measuring the voltage across the battery and the compressor clutch coil.

(2) With the heater-A/C mode control switch in any A/C mode, and the blower motor switch in the lowest speed position, start the engine and run it at normal idle.

(3) The compressor clutch coil voltage should read within two volts of the battery voltage. If there is voltage at the clutch coil, but the reading is not within two volts of the battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as required. If there is no voltage reading at the clutch coil, use a DRB scan tool and the proper Diagnostic Procedures manual for testing of the compressor clutch circuit. The following components must be checked and repaired as required before you can complete testing of the clutch coil:

- Fuses in the junction block and the Power Distribution Center (PDC)

- Heater-A/C mode control switch
- Compressor clutch relay
- High pressure cut-off switch
- Low pressure cycling clutch switch
- Powertrain Control Module (PCM).

(4) The compressor clutch coil is acceptable if the current draw measured at the clutch coil is 2.0 to 3.9 amperes with the electrical system voltage at 11.5 to 12.5 volts. This should only be checked with the work area temperature at 21° C (70° F). If system voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until the system voltage drops below 12.5 volts.

(a) If the clutch coil current reading is four amperes or more, the coil is shorted and should be replaced.

(b) If the clutch coil current reading is zero, the coil is open and should be replaced.

COMPRESSOR CLUTCH RELAY

RELAY TEST

The compressor clutch relay (Fig. 8) is located in the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location. Remove the relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see Relay Circuit Test in the Diagnosis and Testing section of this group. If not OK, replace the faulty relay.

RELAY CIRCUIT TEST

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

(1) The relay common feed terminal cavity (30) is connected to fused battery feed. There should be battery voltage at the cavity for relay terminal 30 at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fuse in the PDC as required.

(2) The relay normally closed terminal (87A) is not used in this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the compressor clutch coil. There should be continuity between this cavity and the A/C compressor clutch relay output circuit cavity of the com-

DIAGNOSIS AND TESTING (Continued)

**Fig. 8 Compressor Clutch Relay**

pressor clutch coil wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

(4) The relay coil battery terminal (86) is connected to the fused ignition switch output (run/start) circuit. There should be battery voltage at the cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the fuse in the junction block as required.

(5) The coil ground terminal cavity (85) is switched to ground through the Powertrain Control Module (PCM). There should be continuity between this cavity and the A/C compressor clutch relay control circuit cavity of the PCM wire harness connector C (gray) at all times. If not OK, repair the open circuit as required.

DUAL FUNCTION HIGH PRESSURE SWITCH/ HIGH PRESSURE CUT-OFF SWITCH

Before performing diagnosis of the dual function high pressure switch, or the high pressure cut-off switch, verify that the refrigerant system has the correct refrigerant charge. See Refrigerant System Charge in the Service Procedures section of this group for more information.

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the high pressure switch wire harness connector from the switch on the refrigerant system fitting.

(3) On the dual function high pressure switch, check for continuity between terminals C and D. On the two terminal switch, check for continuity between both terminals of the high pressure cut-off switch. There should be continuity. If OK, test and repair the A/C switch sense circuit as required. If not OK, replace the faulty switch.

HEATER PERFORMANCE

Before performing the following tests, refer to Group 7 - Cooling System for the procedures to check the radiator coolant level, serpentine drive belt tension, radiator air flow and the radiator fan operation. Also be certain that the accessory vacuum supply line is connected at the engine intake manifold.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control knob in the full hot position, the mode control switch knob in the floor heat position, and the blower motor switch knob in the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the heater-A/C housing floor outlets. Compare the test thermometer reading to the Temperature Reference chart.

Temperature Reference				
Ambient Air Temperature	15.5° C (60° F)	21.1° C (70° F)	26.6° C (80° F)	32.2° C (90° F)
Minimum Air Temperature at Floor Outlet	62.2° C (144° F)	63.8° C (147° F)	65.5° C (150° F)	67.2° C (153° F)

DIAGNOSIS AND TESTING (Continued)

If the floor outlet air temperature is too low, refer to Group 7 - Cooling System to check the engine coolant temperature specifications. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling System for the procedures.

OBSTRUCTED COOLANT FLOW Possible locations or causes of obstructed coolant flow:

- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- A plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is still low, a mechanical problem may exist.

MECHANICAL PROBLEMS Possible locations or causes of insufficient heat:

- An obstructed cowl air intake.
- Obstructed heater system outlets.
- A blend-air door not functioning properly.

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control knob on the heater-A/C control panel, the following could require service:

- The heater-A/C control.
- The temperature control motor.
- The blend-air door.
- Improper engine coolant temperature.

LOW PRESSURE CYCLING CLUTCH SWITCH

Before performing diagnosis of the low pressure cycling clutch switch, be certain that the switch is properly installed on the accumulator fitting. If the switch is too loose it may not open the Schrader-type valve in the accumulator fitting, which will prevent the switch from correctly monitoring the refrigerant system pressure. Remember that lower ambient temperatures, below about -1° C (30° F), during cold weather will open the switch contacts and prevent compressor operation due to the pressure/temperature relationship of the refrigerant.

Also verify that the refrigerant system has the correct refrigerant charge. See Refrigerant System Charge in the Service Procedures section of this group for more information.

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the low pressure cycling clutch switch wire harness connector from the switch on the accumulator fitting.

(3) Install a jumper wire between the two cavities of the low pressure cycling clutch switch wire harness connector.

(4) Connect a manifold gauge set to the refrigerant system service ports. See Refrigerant System Service Equipment and Refrigerant System Service Ports in the Description and Operation section of this group for more information.

(5) Connect the battery negative cable.

(6) Place the heater-A/C mode control switch knob in any A/C position and start the engine.

(7) Check for continuity between the two terminals of the low pressure cycling clutch switch. There should be continuity with a suction pressure reading of 262 kPa (38 psi) or above, and no continuity with a suction pressure reading of 141 kPa (20.5 psi) or below. If OK, test and repair the A/C switch sense circuit as required. If not OK, replace the faulty switch.

REFRIGERANT SYSTEM LEAKS

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE LEAK TESTING THE SYSTEM.

If the air conditioning system is not cooling properly, determine if the refrigerant system is fully-charged. See A/C Performance in this group for the procedures. If the refrigerant system is low or empty; a leak at a refrigerant line, connector fitting, component, or component seal is likely.

An electronic leak detector designed for R-134a refrigerant, or a fluorescent R-134a leak detection dye and a black light are recommended for locating and confirming refrigerant system leaks. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

An oily residue on or near refrigerant system lines, connector fittings, components, or component seals can indicate the general location of a possible refrigerant leak. However, the exact leak location should be confirmed with an electronic leak detector prior to component repair or replacement.

To detect a leak in the refrigerant system with an electronic leak detector, perform one of the following procedures:

SYSTEM EMPTY

(1) Evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

DIAGNOSIS AND TESTING (Continued)

(2) Connect and dispense 0.283 kilograms (0.625 pounds or 10 ounces) of R-134a refrigerant into the evacuated refrigerant system. See Refrigerant System Charge in this group for the procedures.

(3) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(4) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(5) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, and the mode control switch in the recirculation mode.

SYSTEM LOW

(1) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(2) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run with the air conditioning system turned on for five minutes.

(3) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(4) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet. Set the blower motor switch to the lowest speed position, and the mode control switch in the recirculation mode.

VACUUM SYSTEM

Vacuum control is used to operate the mode doors in the heater-only and heater-A/C housings. Testing of the heater-only and heater-A/C mode control switch operation will determine if the vacuum, electrical, and mechanical controls are functioning. However, it is possible that a vacuum control system that operates perfectly at engine idle (high engine vacuum) may not function properly at high engine speeds or loads (low engine vacuum). This can be caused by leaks in the vacuum system, or a faulty vacuum check valve.

A vacuum system test will help to identify the source of poor vacuum system performance or vacuum system leaks. Before starting this test, stop the engine and make certain that the problem is not a disconnected vacuum supply tube at the engine intake manifold vacuum tap or at the vacuum reservoir.

Use an adjustable vacuum test set (Special Tool C-3707-B) and a suitable vacuum pump to test the heater-A/C vacuum control system. With a finger placed over the end of the vacuum test hose probe (Fig. 9), adjust the bleed valve on the test set gauge to obtain a vacuum of exactly 27 kPa (8 in. Hg.). Release and block the end of the probe several times to verify that the vacuum reading returns to the exact 27 kPa (8 in. Hg.) setting. Otherwise, a false reading will be obtained during testing.

Fig. 9 Adjust Vacuum Test Bleed Valve

- 1 - VACUUM PUMP TOOL C-4289
- 2 - VACUUM TEST SET C-3707
- 3 - BLEED VALVE
- 4 - PROBE

VACUUM CHECK VALVE

(1) Remove the vacuum check valve. The valve is located in the vacuum supply tube (black) at the heater-A/C system vacuum tee.

(2) Connect the test set vacuum supply hose to the heater-A/C control side of the valve. When connected to this side of the check valve, no vacuum should pass and the test set gauge should return to the 27 kPa (8 in. Hg.) setting. If OK, go to Step 3. If not OK, replace the faulty valve.

(3) Connect the test set vacuum supply hose to the engine vacuum side of the valve. When connected to this side of the check valve, vacuum should flow through the valve without restriction. If not OK, replace the faulty valve.

HEATER-A/C CONTROLS

(1) Connect the test set vacuum probe to the heater-A/C vacuum supply (black) tube at the tee in the engine compartment. Position the test set gauge so that it can be viewed from the passenger compartment.

DIAGNOSIS AND TESTING (Continued)

(2) Place the heater-A/C mode control switch knob in each mode position, one position at a time, and pause after each selection. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each selection is made. If not OK, a component or vacuum line in the vacuum circuit of the selected mode has a leak. See the procedure in Locating Vacuum Leaks.

CAUTION: Do not use lubricant on the switch ports or in the holes in the plug, as lubricant will ruin the vacuum valve in the switch. A drop of clean water in the connector plug holes will help the connector slide onto the switch ports.

LOCATING VACUUM LEAKS

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect the vacuum harness connector behind the glove box and inboard of the glove box opening on the heater-A/C housing.

(2) Connect the test set vacuum hose probe to each port in the heater-A/C housing half of the vacuum harness connector, one port at a time, and pause after each connection (Fig. 10). The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty heater-A/C control. If not OK, go to Step 3.

(3) Determine the vacuum line color of the vacuum circuit that is leaking. To determine the vacuum line colors, refer to the Vacuum Circuits chart (Fig. 11) or (Fig. 12).

(4) Disconnect and plug the vacuum line from the component (fitting, actuator, valve, switch, or reservoir) on the other end of the leaking circuit. Instrument panel disassembly or removal may be necessary to gain access to some components. See the service procedures in this group.

(5) Connect the test set hose or probe to the open end of the leaking circuit. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty disconnected component. If not OK, go to Step 6.

(6) To locate a leak in a vacuum line, leave one end of the line plugged and connect the test set hose or probe to the other end of the line. Run your fingers slowly along the line while watching the test set

Fig. 10 Vacuum Circuit Test

gauge. The vacuum reading will fluctuate when your fingers contact the source of the leak. To repair the vacuum line, cut out the leaking section of the line. Then, insert the loose ends of the line into a suitable length of 3 millimeter (0.125 inch) inside diameter rubber hose.

SERVICE PROCEDURES

REFRIGERANT OIL LEVEL

When an air conditioning system is assembled at the factory, all components except the compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the compressor is dispersed throughout the refrigerant system. The accumulator, evaporator, condenser, and compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of oil in the refrigerant system. This ensures proper lubrication of the compressor. Too little oil will result in damage to the compressor. Too much oil will reduce the cooling capacity of the air conditioning system.

It will not be necessary to check the oil level in the compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an accumulator, evaporator coil, or condenser are replaced. See the Refrigerant Oil Capacities chart. When a compressor

SERVICE PROCEDURES (Continued)

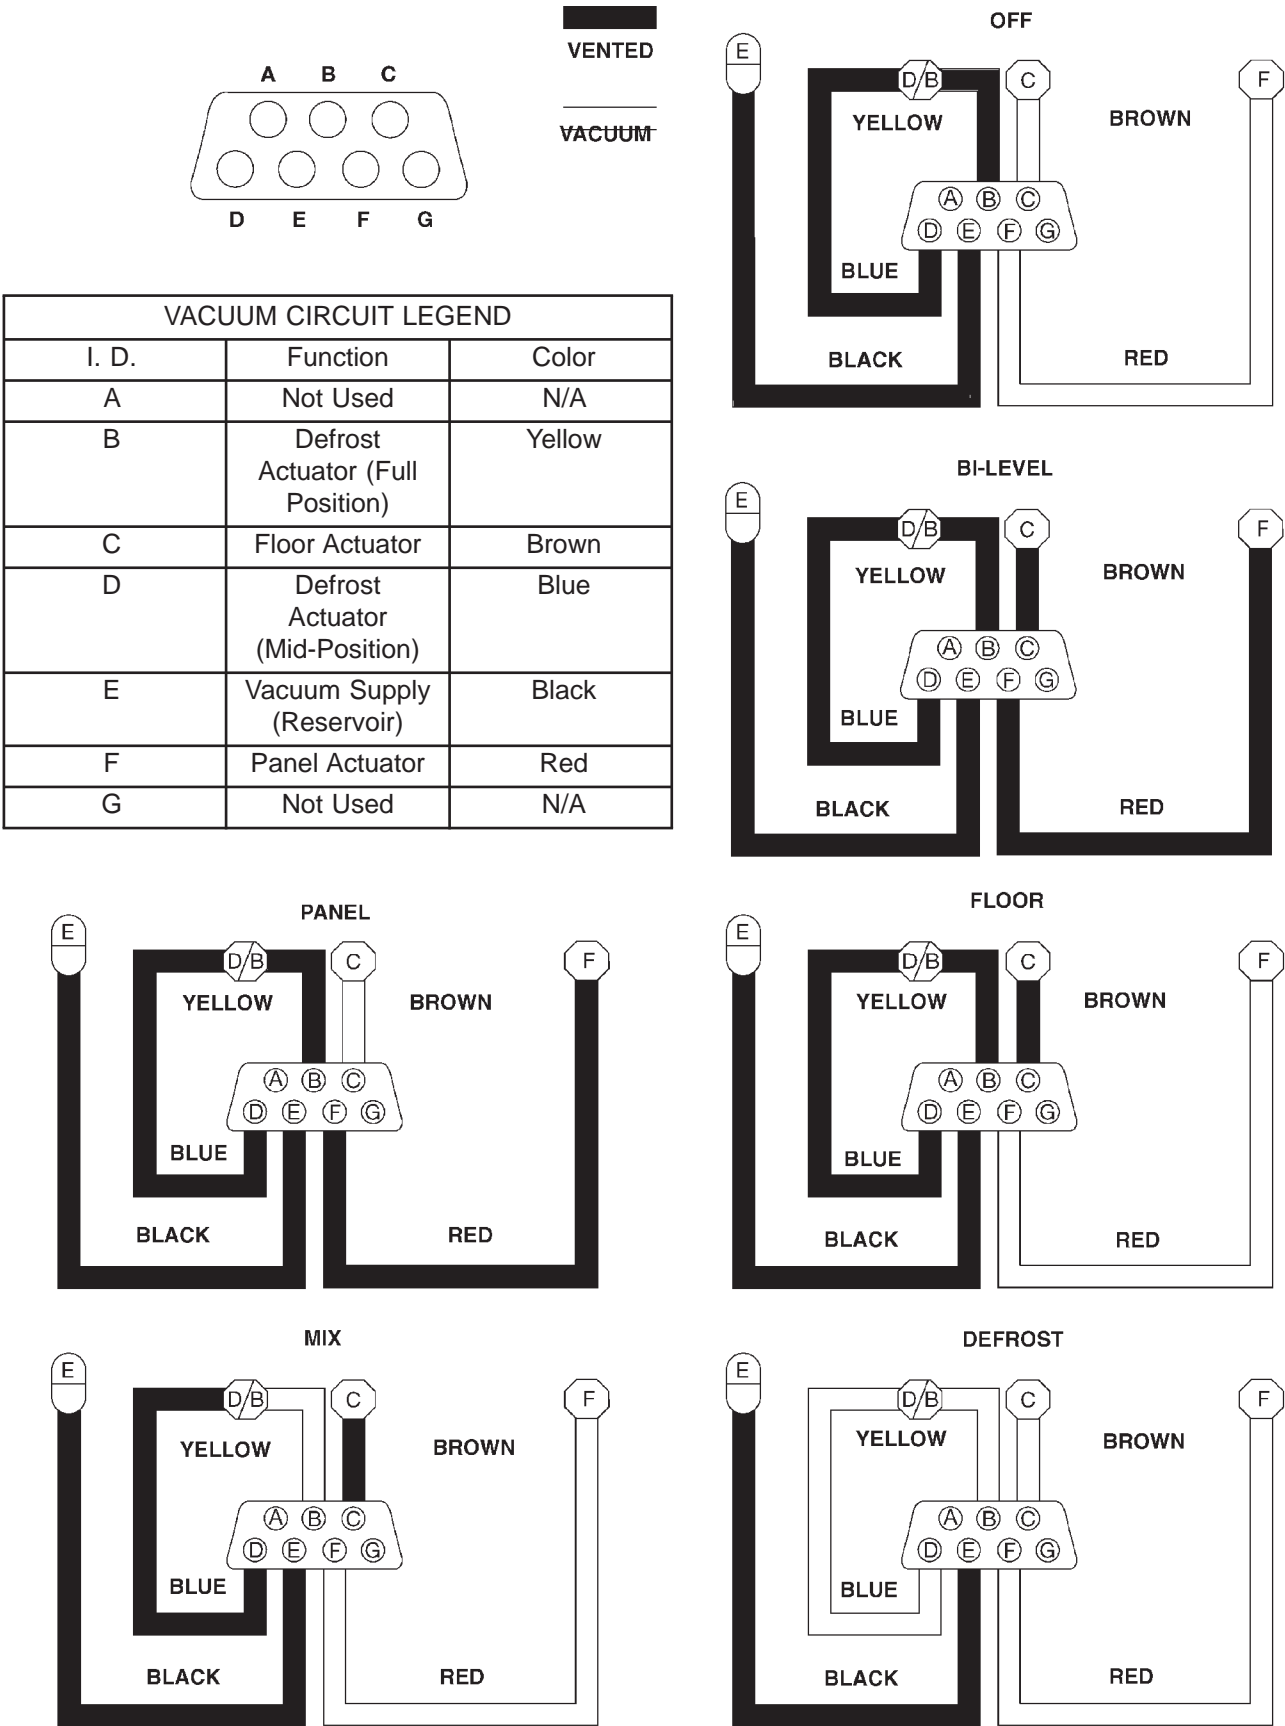

Fig. 11 Vacuum Circuits - Heater Only

80aac2d2

SERVICE PROCEDURES (Continued)

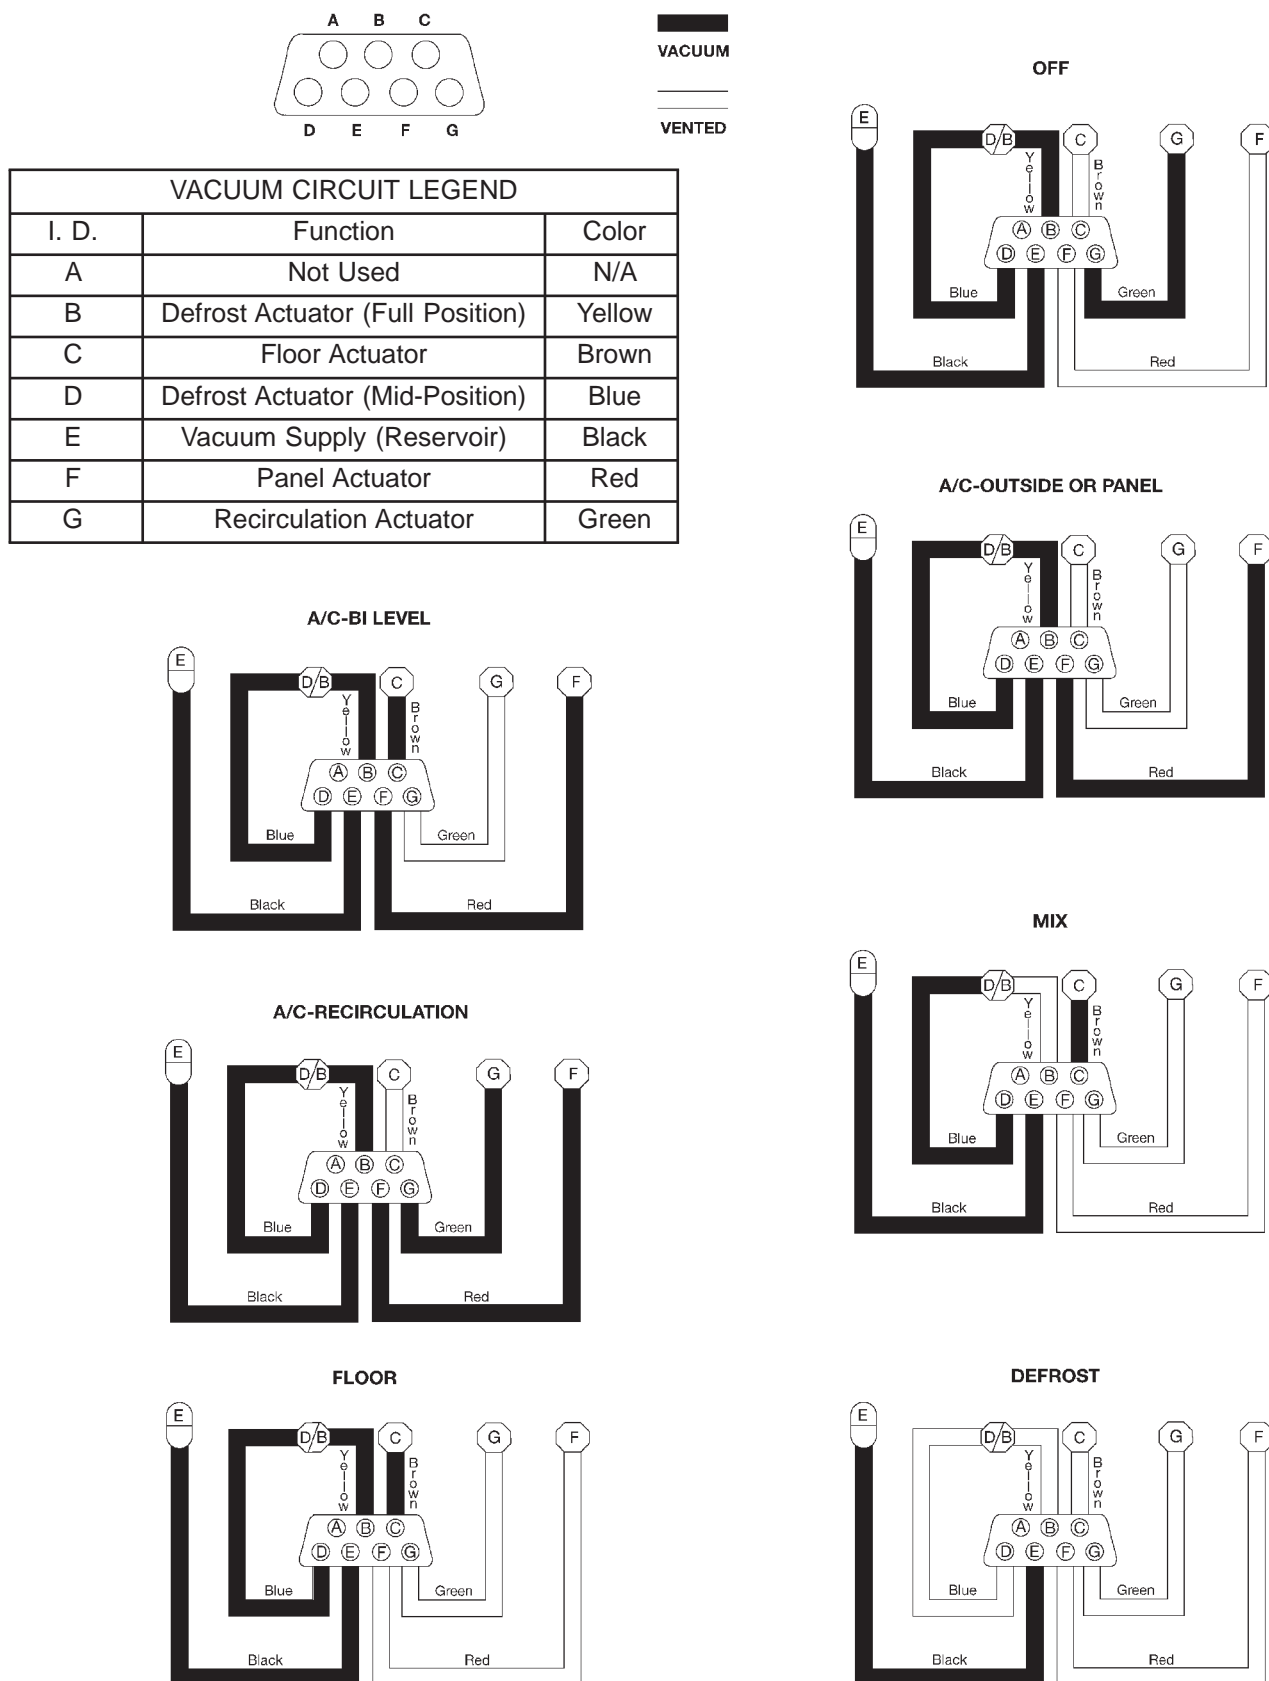

Fig. 12 Vacuum Circuits - Heater-A/C

SERVICE PROCEDURES (Continued)

is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

Refrigerant Oil Capacities		
Component	ml	fl oz
A/C System	180	6.1
Accumulator	90	3
Condenser	22	.75
Evaporator	45	1.5
Compressor	drain and measure the oil from the old compressor as noted	

REFRIGERANT RECOVERY

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE RECOVERING REFRIGERANT.

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT SYSTEM EVACUATE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE EVACUATING THE SYSTEM.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be charged. If moisture and air enters the system and becomes mixed with the refrigerant, the compressor head pressure will rise above acceptable operating levels. This will reduce the performance of the air conditioner and damage the compressor. Evacuating the refrigerant system will remove the air and boil the moisture out of the system at near room temperature. To evacuate the refrigerant system, use the following procedure:

- (1) Connect a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 and a manifold gauge set to the refrigerant system of the vehicle.
- (2) Open the low and high side valves and start the charging station vacuum pump. When the suction gauge reads 88 kPa (26 in. Hg.) vacuum or

greater, close all of the valves and turn off the vacuum pump.

(a) If the refrigerant system fails to reach the specified vacuum, the system has a leak that must be corrected. See Refrigerant System Leaks in the Diagnosis and Testing section of this group for the procedures.

(b) If the refrigerant system maintains the specified vacuum for five minutes, restart the vacuum pump, open the suction and discharge valves and evacuate the system for an additional ten minutes.

(3) Close all of the valves, and turn off the charging station vacuum pump.

(4) The refrigerant system is now ready to be charged with R-134a refrigerant. See Refrigerant System Charge in the Service Procedures section of this group.

REFRIGERANT SYSTEM CHARGE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE CHARGING THE REFRIGERANT SYSTEM.

After the refrigerant system has been tested for leaks and evacuated, a refrigerant charge can be injected into the system. See Refrigerant Charge Capacity for the proper amount of the refrigerant charge.

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

REFRIGERANT CHARGE CAPACITY

The R-134a refrigerant system charge capacity for this vehicle is 0.567 kilograms (1.25 pounds).

REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: EYE PROTECTION MUST BE WORN WHEN SERVICING AN AIR CONDITIONING REFRIGERANT SYSTEM. TURN OFF (ROTATE CLOCKWISE) ALL VALVES ON THE EQUIPMENT BEING USED, BEFORE CONNECTING TO OR DISCONNECTING FROM THE REFRIGERANT SYSTEM. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY.

When servicing the air conditioning system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used. Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the

SERVICE PROCEDURES (Continued)

equipment manufacturer for proper care and use of this equipment.

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 13). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

Fig. 13 Manifold Gauge Set - Typical

- 1 - HIGH PRESSURE GAUGE
- 2 - VALVE
- 3 - VACUUM/REFRIGERANT HOSE (YELLOW W/BLACK STRIPE)
- 4 - HIGH PRESSURE HOSE (RED W/BLACK STRIPE)
- 5 - LOW PRESSURE HOSE (BLUE W/BLACK STRIPE)
- 6 - VALVE
- 7 - LOW PRESSURE GAUGE

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

LOW PRESSURE GAUGE HOSE The low pressure hose (Blue with Black stripe) attaches to the suction service port. This port is located on the suction line between the accumulator outlet and the compressor.

HIGH PRESSURE GAUGE HOSE The high pressure hose (Red with Black stripe) attaches to the discharge service port. This port is located on the discharge line between the compressor and the condenser inlet.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

REMOVAL AND INSTALLATION

SERVICE WARNINGS AND PRECAUTIONS

WARNING:

- **THE AIR CONDITIONING SYSTEM CONTAINS REFRIGERANT UNDER HIGH PRESSURE. SEVERE PERSONAL INJURY MAY RESULT FROM IMPROPER SERVICE PROCEDURES. REPAIRS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL.**

- **AVOID BREATHING THE REFRIGERANT AND REFRIGERANT OIL VAPOR OR MIST. EXPOSURE MAY IRRITATE THE EYES, NOSE, AND/OR THROAT. WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM DIRECT CONTACT WITH THE REFRIGERANT. IF EYE CONTACT OCCURS, SEEK MEDICAL ATTENTION IMMEDIATELY.**

- **DO NOT EXPOSE THE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC LEAK DETECTOR IS RECOMMENDED.**

- **IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE THE WORK AREA BEFORE RESUMING SERVICE. LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION.**

- **THE EVAPORATION RATE OF R-134a REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT THE SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH THE REFRIGERANT.**

- **THE R-134a SERVICE EQUIPMENT OR THE VEHICLE REFRIGERANT SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS, AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.**

REMOVAL AND INSTALLATION (Continued)

CAUTION:

- Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.
- Never add R-12 to a refrigerant system designed to use R-134a. Damage to the system will result.
- R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible.
- Do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.
- Do not overcharge the refrigerant system. This will cause excessive compressor head pressure and can cause noise and system failure.
- Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.
- Do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.
- The refrigerant system must always be evacuated before charging.
- Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system.
- Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.
- Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.
- Before connecting an open refrigerant fitting, always install a new seal or gasket. Coat the fitting and seal with clean refrigerant oil before connecting.
- Do not remove the sealing caps from a replacement component until it is to be installed.
- When installing a refrigerant line, avoid sharp bends that may restrict refrigerant flow. Position the refrigerant lines away from exhaust system components or any sharp edges, which may damage the line.
- Tighten refrigerant fittings only to the specified torque. The aluminum fittings used in the refrigerant system will not tolerate overtightening.
- When disconnecting a refrigerant fitting, use a wrench on both halves of the fitting. This will prevent twisting of the refrigerant lines or tubes.

- Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, air-tight, and moisture-free container.

- Keep service tools and the work area clean. Contamination of the refrigerant system through careless work habits must be avoided.

COOLING SYSTEM REQUIREMENTS

To maintain the performance level of the heating-air conditioning system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or condenser will reduce the performance of the air conditioning and engine cooling systems.

The engine cooling system includes the heater core and the heater hoses. Refer to Group 7 - Cooling System for more information before the opening of, or attempting any service to the engine cooling system.

REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS

Kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire system. High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all refrigerant system connections are pressure tight.

A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. Sharp bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold. It is a good practice to inspect all flexible refrigerant system hose lines at least once a year to make sure they are in good condition and properly routed.

There are two types of refrigerant fittings:

- All fittings with O-rings need to be coated with refrigerant oil before installation. Use only O-rings that are the correct size and approved for use with R-134a refrigerant. Failure to do so may result in a leak.

- Unified plumbing connections with gaskets cannot be serviced with O-rings. The gaskets are not reusable and new gaskets do not require lubrication before installing.

Using the proper tools when making a refrigerant plumbing connection is very important. Improper tools or improper use of the tools can damage the refrigerant fittings. Always use two wrenches when loosening or tightening tube fittings. Use one wrench

REMOVAL AND INSTALLATION (Continued)

to hold one side of the connection stationary, while loosening or tightening the other side of the connection with a second wrench.

The refrigerant must be recovered completely from the system before opening any fitting or connection. Open the fittings with caution, even after the refrigerant has been recovered. If any pressure is noticed as a fitting is loosened, tighten the fitting and recover the refrigerant from the system again.

Do not discharge refrigerant into the atmosphere. Use an R-134a refrigerant recovery/recycling device that meets SAE Standard J2210.

The refrigerant system will remain chemically stable as long as pure, moisture-free R-134a refrigerant and refrigerant oil is used. Dirt, moisture, or air can upset this chemical stability. Operational troubles or serious damage can occur if foreign material is present in the refrigerant system.

When it is necessary to open the refrigerant system, have everything needed to service the system ready. The refrigerant system should not be left open to the atmosphere any longer than necessary. Cap or plug all lines and fittings as soon as they are opened to prevent the entrance of dirt and moisture. All lines and components in parts stock should be capped or sealed until they are to be installed.

All tools, including the refrigerant recycling equipment, the manifold gauge set, and test hoses should be kept clean and dry. All tools and equipment must be designed for R-134a refrigerant.

ACCUMULATOR

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in this group for the procedures.

(3) Unplug the wire harness connector from the low pressure cycling clutch switch.

(4) Loosen the screw that secures the accumulator retaining band to the support bracket on the dash panel (Fig. 14).

(5) Disconnect the suction line from the accumulator outlet tube refrigerant line fitting. See Refrigerant Line Coupler in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Disconnect the accumulator inlet tube refrigerant line fitting from the evaporator outlet tube. See Refrigerant Line Coupler in this group for the proce-

dures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(7) Pull the accumulator and retaining band unit forward until the screw in the band is clear of the slotted hole in the support bracket on the dash panel.

(8) Remove the accumulator from the vehicle.

INSTALLATION

(1) Install the accumulator and retaining band as a unit by sliding the screw in the band into the slotted hole in the support bracket on the dash panel.

(2) Remove the tape or plugs from the refrigerant line fittings on the accumulator inlet tube and the evaporator outlet tube. Connect the accumulator inlet tube refrigerant line coupler to the evaporator outlet tube. See Refrigerant Line Coupler in this group for the procedures.

(3) Tighten the accumulator retaining band screw to 5 N·m (45 in. lbs.).

(4) Remove the tape or plugs from the refrigerant line fittings on the suction line and the accumulator outlet tube. Connect the suction line to the accumu-

REMOVAL AND INSTALLATION (Continued)

lator outlet tube refrigerant line coupler. See Refrigerant Line Coupler in this group for the procedures.

(5) Plug the wire harness connector into the low pressure cycling clutch switch.

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

(8) Charge the refrigerant system. See Refrigerant System Charge in this group for the procedures.

NOTE: If the accumulator is replaced, add 120 milliliters (4 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

80c073d9

BLEND-AIR DOOR MOTOR

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Disconnect the wire connector from the blend-air door motor.

(3) Remove the screws that secure the blend-air door motor to the housing (Fig. 15).

(4) Remove the blend-air door motor.

INSTALLATION

(1) Reverse the removal procedures for installation.

(2) Install and tighten the screws that secures the blend-air door motor to the housing. Tighten the mounting screws to 1 N·m (10 in. lbs.).

(3) Connect the battery negative cable.

BLOWER MOTOR

REMOVAL

(1) If the vehicle is equipped with air conditioning, recover the refrigerant from the refrigerant system. See Refrigerant Recovery in this group for the procedures.

(2) Disconnect and isolate the battery negative cable.

Fig. 15 Blend-Air Door Motor

- 1 - ELECTRICAL CONNECTOR
- 2 - BLEND-AIR DOOR MOTOR
- 3 - SCREW MOUNTING POINTS

(3) If the vehicle is equipped with air conditioning, the accumulator must be relocated in order to service the blower motor. This is done by loosening the accumulator retaining band screw and disconnecting the accumulator inlet tube from the evaporator outlet tube. The accumulator can then be moved far enough to access and remove the blower motor. See Accumulator in this group for the procedures.

(4) Unplug the blower motor wire harness connector (Fig. 16).

(5) Remove the three screws that secure the blower motor and wheel assembly to the heater-A/C housing.

(6) Rotate and tilt the blower motor unit as needed for clearance to remove the blower motor and wheel from the heater-A/C housing.

INSTALLATION

(1) Align and install the blower motor and wheel assembly into the heater-A/C housing.

(2) Install and tighten the three screws that secure the blower motor and wheel assembly to the heater-A/C housing. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(3) Plug in the blower motor wire harness connector.

(4) If the vehicle is equipped with air conditioning, connect the accumulator inlet tube to the evaporator outlet tube and tighten the accumulator retaining band screw. See Accumulator in this group for the procedures.

(5) Connect the battery negative cable.

REMOVAL AND INSTALLATION (Continued)

**Fig. 16 Blower Motor Remove/Install**

- 1 - BLOWER MOTOR
- 2 - WIRE HARNESS CONNECTOR
- 3 - MOUNTING SCREWS

(6) If the vehicle is equipped with air conditioning, evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

(7) If the vehicle is equipped with air conditioning, charge the refrigerant system. See Refrigerant System Charge in this group for the procedures.

BLOWER MOTOR RELAY

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Roll the glove box down from the instrument panel. Refer to Glove Box in Group 8E - Instrument Panel Systems for the procedures.

(3) Reach through the instrument panel glove box opening to locate the blower motor relay (Fig. 17).

(4) Unplug the blower motor relay from its wire harness connector.

(5) Install the blower motor relay by aligning the relay terminals with the cavities in the wire harness connector and pushing the relay firmly into place.

**Fig. 17 Blower Motor Relay Remove/Install**

- 1 - BLOWER MOTOR RELAY
- 2 - VACUUM HARNESS
- 3 - HEATER-A/C WIRE HARNESS CONNECTOR
- 4 - HEATER-A/C HOUSING

(6) Roll the glove box back up into the instrument panel. Refer to Glove Box in Group 8E - Instrument Panel Systems for the procedures.

(7) Connect the battery negative cable.

(8) Test the relay operation.

BLOWER MOTOR RESISTOR

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the kick cover from the heater-A/C housing. See Kick Cover in this group for the procedures.

(3) Pull out the lock on the blower motor resistor wire harness connector to unlock the connector latch (Fig. 18).

(4) Depress the latch on the blower motor resistor wire harness connector and unplug the connector from the resistor.

(5) Remove the two screws that secure the resistor to the heater-A/C housing.

(6) Remove the resistor from the heater-A/C housing.

(7) Reverse the removal procedures to install. Tighten the mounting screws to 2.2 N·m (20 in lbs.).

REMOVAL AND INSTALLATION (Continued)

**Fig. 18 Blower Motor Resistor Remove/Install**

- 1 - SCREWS
- 2 - WIRE HARNESS CONNECTOR
- 3 - CONNECTOR LOCK
- 4 - HEATER-A/C HOUSING
- 5 - BLOWER MOTOR RESISTOR

COMPRESSOR

The compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch or clutch coil, the engine, the cylinder head, or the generator.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in this group for the procedures.

(2) Disconnect and isolate the battery negative cable.

(3) Remove the serpentine drive belt. Refer to Group 7 - Cooling System for the procedures.

(4) Unplug the compressor clutch coil wire harness connector.

(5) Remove the suction and discharge refrigerant line manifold from the compressor. See Suction and Discharge Line in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant fittings.

(6) Remove the four bolts that secure the compressor to the mounting bracket (Fig. 19).

(7) Remove the compressor from the mounting bracket.

**Fig. 19 Compressor Remove/Install - All 2.5L/4.0L Engines**

- 1 - BOLT
- 2 - MOUNTING BRACKET
- 3 - ENGINE
- 4 - COMPRESSOR

INSTALLATION

NOTE: If a replacement compressor is being installed, be certain to check the refrigerant oil level. See Refrigerant Oil Level in this group for the procedures. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Install the compressor to the mounting bracket. Tighten the four mounting bolts as follows:

- All 2.5L and 4.0L engines - 27 N·m (20 ft. lbs.)

(2) Remove the tape or plugs from all of the opened refrigerant line fittings. Install the suction and discharge line manifold to the compressor. See Suction and Discharge Line in this group for the procedures.

(3) Install the serpentine drive belt. Refer to Group 7 - Cooling System for the procedures.

(4) Plug in the compressor clutch coil wire harness connector.

(5) Connect the battery negative cable.

(6) Evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

(7) Charge the refrigerant system. See Refrigerant System Charge in this group for the procedures.

REMOVAL AND INSTALLATION (Continued)

COMPRESSOR CLUTCH

The refrigerant system can remain fully-charged during compressor clutch, pulley, or coil replacement. The compressor clutch can be serviced in the vehicle.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Remove the serpentine drive belt. Refer to Group 7 - Cooling System for the procedures.
- (3) Unplug the compressor clutch coil wire harness connector.
- (4) Remove the four bolts that secure the compressor to the mounting bracket.
- (5) Remove the compressor from the mounting bracket. Support the compressor in the engine compartment while servicing the clutch.
- (6) Insert the two pins of the spanner wrench (Special Tool C-4489) into the holes of the clutch plate. Hold the clutch plate stationary and remove the hex nut (Fig. 20).

**Fig. 20 Clutch Nut Remove**

- 1 - CLUTCH PLATE
2 - SPANNER

- (7) Remove the clutch plate with a puller (Special Tool C-6461) (Fig. 21).
- (8) Remove the compressor shaft key and the clutch shims.
- (9) Remove the external front housing snap ring with snap ring pliers (Fig. 22).
- (10) Install the lip of the rotor puller (Special Tool C-6141-1) into the snap ring groove exposed in the previous step, and install the shaft protector (Special Tool C-6141-2) (Fig. 23).
- (11) Install the puller through-bolts (Special Tool C-6461) through the puller flange and into the jaws of the rotor puller and tighten (Fig. 24). Turn the

**Fig. 21 Clutch Plate Remove**

- 1 - CLUTCH PLATE PULLER
2 - CLUTCH PLATE

**Fig. 22 External Snap Ring Remove**

- 1 - PULLEY
2 - SNAP RING PLIERS

puller center bolt clockwise until the rotor pulley is free.

- (12) Remove the screw and retainer from the clutch coil lead wire harness on the compressor front housing (Fig. 25).

- (13) Remove the snap ring from the compressor hub and remove the clutch field coil (Fig. 26). Slide the clutch field coil off of the compressor hub.

INSPECTION

Examine the friction surfaces of the clutch pulley and the front plate for wear. The pulley and front plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the compressor for oil. Remove the

REMOVAL AND INSTALLATION (Continued)

**Fig. 23 Shaft Protector and Puller**

- 1 - PULLER JAW
2 - SHAFT PROTECTOR

2 - PULLER

**Fig. 26 Clutch Field Coil Snap Ring Remove**

- 1 - COIL
2 - SNAP RING PLIERS

felt from the front cover. If the felt is saturated with oil, the shaft seal is leaking and the compressor must be replaced.

Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the bearing, if required.

INSTALLATION

- (1) Install the clutch field coil and snap ring.
- (2) Install the clutch coil lead wire harness retaining clip on the compressor front housing and tighten the retaining screw.
- (3) Align the rotor assembly squarely on the front compressor housing hub.
- (4) Install the pulley bearing assembly with the installer (Special Tool C-6871) (Fig. 27). Thread the

installer on the shaft, then turn the nut until the pulley assembly is seated.

- (5) Install the external front snap ring with snap ring pliers. The bevel side of the snap ring must be facing outward. Press the snap ring to make sure it is properly seated in the groove.

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the front housing of the compressor.

- (6) Install the compressor shaft key and the original clutch shims on the compressor shaft.

REMOVAL AND INSTALLATION (Continued)

**Fig. 27 Clutch Pulley Install**

- 1 - PULLEY BEARING ASSEMBLY
2 - INSTALLER

(7) Install the clutch plate with the driver (Special Tool C-6463) (Fig. 28). Install the shaft hex nut and tighten to 14.4 N·m (10.5 ft. lbs.).

**Fig. 28 Clutch Plate Driver**

- 1 - CLUTCH PLATE
2 - DRIVER

(8) Check the clutch air gap with a feeler gauge (Fig. 29). If the air gap does not meet the specification, add or subtract shims as required. The air gap specification is 0.41 to 0.79 millimeter (0.016 to 0.031 inch). If the air gap is not consistent around the circumference of the clutch, lightly pry up at the minimum variations. Lightly tap down at the points of maximum variation.

NOTE: The air gap is determined by the spacer shims. When installing an original, or a new clutch assembly, try the original shims first. When installing a new clutch onto a compressor that previously

J8924-28

Fig. 29 Check Clutch Air Gap

- 1 - FEELER GAUGE

did not have a clutch, use 1.0, 0.50, and 0.13 millimeter (0.040, 0.020, and 0.005 inch) shims from the clutch hardware package that is provided with the new clutch.

(9) Reverse the remaining removal procedures to complete the installation.

CLUTCH BREAK-IN

After a new compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the heater-A/C control to the Recirculation Mode, the blower motor switch in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

COMPRESSOR CLUTCH RELAY

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 30).

(3) Refer to the label on the PDC for compressor clutch relay identification and location.

(4) Unplug the compressor clutch relay from the PDC.

(5) Install the compressor clutch relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(6) Install the PDC cover.

(7) Connect the battery negative cable.

(8) Test the relay operation.

REMOVAL AND INSTALLATION (Continued)

**Fig. 30 Power Distribution Center**

- 1 - RIGHT FENDER
- 2 - BATTERY
- 3 - POWER DISTRIBUTION CENTER

CONDENSER

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

CAUTION: Before removing the condenser, note the location of each of the radiator and condenser air seals. These seals are used to direct air through the condenser and radiator. The air seals must be reinstalled in their proper locations in order for the air conditioning and engine cooling systems to perform as designed.

REMOVAL

- (1) Disconnect and isolate the battery negative cable.
- (2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in this group for the procedures.
- (3) Disconnect the discharge line refrigerant line fitting at the condenser inlet. See Refrigerant Line Coupler in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.
- (4) Disconnect the liquid line (Left-Hand Drive) or liquid line jumper (Right-Hand Drive) refrigerant

line fitting at the condenser outlet. See Refrigerant Line Coupler in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Remove the radiator and the condenser from the vehicle as a unit. Refer to Group 7 - Cooling System for the procedures.

(6) Remove the two nuts that secure the condenser studs to the upper brackets of the radiator (Fig. 31).

80b0d766

Fig. 31 Condenser Remove/Install

- 1 - NUT
- 2 - RADIATOR
- 3 - GROMMET
- 4 - LOWER CROSSMEMBER
- 5 - CONDENSER
- 6 - STUDS

(7) Slide the condenser down from the radiator far enough for the condenser studs to clear the upper radiator bracket holes, and for the lower condenser bracket holes to clear the dowel pins on the bottom of the radiator.

(8) Remove the condenser from the radiator.

INSTALLATION

- (1) Install the holes of the condenser lower brackets over the dowel pins on the bottom of the radiator.
- (2) Slide the condenser upwards until both of the condenser studs are installed through the holes in the radiator upper brackets. Tighten the mounting nuts to 5.3 N·m (47 in. lbs.).
- (3) Reinstall the radiator and condenser unit in the vehicle. Refer to Group 7 - Cooling System for the procedures.
- (4) Remove the tape or plugs from the refrigerant line fittings on the condenser outlet and the liquid line (Left-Hand Drive) or the liquid line jumper (Right-Hand Drive). Install the liquid line or the liq-

REMOVAL AND INSTALLATION (Continued)

uid line jumper to the condenser outlet. See Refrigerant Line Coupler in this group for the procedures.

(5) Remove the tape or plugs from the refrigerant line fittings on the condenser inlet and the discharge line. Connect the discharge line to the condenser inlet. See Refrigerant Line Coupler in this group for the procedures.

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

(8) Charge the refrigerant system. See Refrigerant System Charge in this group for the procedures.

NOTE: If the condenser is replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

DUAL FUNCTION HIGH PRESSURE SWITCH/
HIGH PRESSURE CUT-OFF SWITCH

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the dual function high pressure switch or the high pressure cut-off switch, which is mounted to a fitting on the non-flexible section of the discharge line nearest the compressor.

(3) Unscrew the high pressure switch from the discharge line fitting.

(4) Remove the high pressure switch from the vehicle.

(5) Remove the O-ring seal from the discharge line fitting and discard.

INSTALLATION

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(2) Install and tighten the high pressure switch on the discharge line fitting.

(3) Plug the wire harness connector into the high pressure cut-off switch.

(4) Connect the battery negative cable.

DUCTS AND OUTLETS

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY

STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

PANEL OUTLET DUCTS

The panel outlet ducts are integral to the instrument panel assembly. Refer to Instrument Panel Assembly in Group 8E - Instrument Panel Systems for the procedures.

PANEL OUTLET BARRELS

(1) Use a trim stick or another suitable wide flat-bladed tool to gently pry the panel outlet barrel out of the panel outlet housing (Fig. 32). The barrel is retained by a light snap fit.

80abd29e

Fig. 32 Panel Outlet Barrels

- 1 - DEMISTER OUTLETS
- 2 - PANEL OUTLET BARRELS

(2) To install, position the barrel in the panel outlet housing and press firmly until the barrel snaps into place.

DEMISTER OUTLETS

The side window demister outlets are integral to the instrument panel end caps. Refer to Instrument Panel End Cap in Group 8E - Instrument Panel Systems for the procedures.

DEFROST DUCT/DEMISTER ADAPTER

(1) Remove the instrument panel assembly from the vehicle. Refer to Instrument Panel Assembly in Group 8E - Instrument Panel Systems for the procedures.

(2) Disconnect the demister hoses from the defrost duct/demister adapter (Fig. 33).

REMOVAL AND INSTALLATION (Continued)

**Fig. 33 Defrost Duct/Demister Adapter**

- 1 - HOSE
- 2 - INSTRUMENT PANEL
- 3 - DEFROST DUCT/DEMISTER ADAPTER
- 4 - SCREW
- 5 - HOSE

(3) Remove the three screws that secure the defrost duct/demister adapter to the instrument panel.

(4) Remove the defrost duct/demister adapter from the instrument panel.

(5) Reverse the removal procedures to install. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

DEMISTER HOSES

(1) Remove the instrument panel assembly from the vehicle. Refer to Instrument Panel Assembly in Group 8E - Instrument Panel Systems for the procedures.

(2) Disconnect the ends of the demister hose from the demister duct (Fig. 34) and the defrost duct/demister adapter (Fig. 33).

(3) Reverse the removal procedures to install.

DEMISTER DUCTS

(1) Remove the instrument panel assembly from the vehicle. Refer to Instrument Panel Assembly in Group 8E - Instrument Panel Systems for the procedures.

(2) Remove the end cap from the instrument panel. Refer to Instrument Panel End Cap in Group 8E - Instrument Panel Systems for the procedures.

(3) Disconnect the demister hoses from the demister duct (Fig. 34).

(4) Remove the two screws that secure the demister duct to the top of the instrument panel.

(5) Remove the demister duct from the instrument panel.

**Fig. 34 Demister Duct Remove/Install**

- 1 - DEMISTER DUCT
- 2 - SCREWS
- 3 - DEMISTER HOSE

(6) Reverse the removal procedures to install. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

CONSOLE REAR DUCT

(1) Disconnect and isolate the battery negative cable.

(2) Remove the floor console from the floor panel transmission tunnel (Fig. 35). Refer to Group 23 - Body for the procedures.

(3) Lift the rear of the console rear duct out of the console rear mounting bracket on the floor panel transmission tunnel and slide the duct rearward to disengage it from the floor duct and adapter.

(4) Remove the console rear duct from the vehicle.

(5) Reverse the removal procedures to install.

FLOOR DUCT AND ADAPTER

(1) Remove the instrument panel from the vehicle. Refer to Instrument Panel Assembly in Group 8E - Instrument Panel Systems for the procedures.

(2) Remove the heater-A/C housing from the vehicle. See Heater-A/C Housing in this group for the procedures.

(3) Remove the three screws that secure the floor duct and adapter to the heater-A/C housing (Fig. 35).

(4) Remove the floor duct and adapter from the heater-A/C housing.

(5) Reverse the removal procedures to install. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

REMOVAL AND INSTALLATION (Continued)

Fig. 35 Floor Duct and Console Rear Duct Remove/Install

- 1 – FLOOR CONSOLE
- 2 – SCREW
- 3 – FLOOR DUCT AND ADAPTER
- 4 – CONSOLE REAR DUCT

EVAPORATOR COIL

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove and disassemble the heater-A/C housing. See Heater-A/C Housing in this group for the procedures.

(2) Lift the evaporator coil unit out of the lower half of the heater-A/C housing (Fig. 36).

(3) Reverse the removal procedures to install. Be certain that the evaporator foam insulator wrap and rubber tube seal are reinstalled.

NOTE: If the evaporator is replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

FIXED ORIFICE TUBE

The fixed orifice tube is located in the liquid line (Left-Hand Drive) or the liquid line jumper (Right-

Fig. 36 Evaporator Coil Remove/Install

- 1 – EVAPORATOR COIL
- 2 – TUBE SEAL
- 3 – CONDENSATE DRAIN TUBE
- 4 – FOAM INSULATOR WRAP

Hand Drive) near the condenser. The orifice has filter screens on the inlet and outlet ends of the tube body. If the fixed orifice tube is faulty or plugged, the liquid line unit or liquid line jumper unit must be replaced. See Liquid Line in this group for the service procedures.

HEATER-A/C CONTROL

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Roll down the glove box from the instrument panel. Refer to Glove Box in Group 8E - Instrument Panel Systems for the procedures.

(3) Reach through the instrument panel glove box opening to access and unplug the two halves of the heater-A/C vacuum harness connector.

REMOVAL AND INSTALLATION (Continued)

(4) Remove the center bezel from the instrument panel. Refer to Instrument Panel Center Bezel in Group 8E - Instrument Panel Systems for the procedures.

(5) Release the vacuum harness push-in retainer from the instrument panel directly beneath the heater-A/C control.

(6) Remove the four screws that secure the heater-A/C control to the instrument panel (Fig. 37).

80ba777C

Fig. 37 Heater-A/C Control Remove/Install

- 1 - MOUNTING HOLES
- 2 - CONTROL HEAD
- 3 - HEATER-A/C CONTROL HEAD
- 4 - MOUNTING HOLES
- 5 - VACUUM HARNESS
- 6 - TEMPERATURE SELECT CONTROL
- 7 - MODE SELECT CONTROL
- 8 - BLOWER SPEED CONTROL

(7) Pull the heater-A/C control assembly away from the instrument panel far enough to access the connections on the back of the control.

(8) Unplug the wire harness connectors from the back of the heater-A/C control (Fig. 38).

(9) Reach through the instrument panel glove box opening to guide the heater-A/C control half of the vacuum harness around any obstacles while pulling the heater-A/C control out from the front of the instrument panel.

INSTALLATION

(1) Plug the wire harness connectors into the back of the heater-A/C control.

(2) Route the vacuum harness through the instrument panel opening and reinstall the vacuum harness push-in retainer.

(3) Reach through the instrument panel glove box opening to reconnect the two halves of the heater-A/C vacuum harness connector.

(4) Roll the glove box back up into the instrument panel. Refer to Glove Box in Group 8E - Instrument Panel Systems for the procedures.

80ba7771

Fig. 38 Heater-A/C Control Connections

- 1 - HEATER-A/C CONTROL HEAD
- 2 - MODE SELECT CONTROL
- 3 - BLOWER SPEED CONTROL
- 4 - ELECTRICAL CONNECTORS
- 5 - VACUUM HARNESS
- 6 - TEMPERATURE SELECT CONTROL

(5) Position the heater-A/C control in the instrument panel and secure it with four screws. Tighten the screws to 2.2 N·m (20 in. lbs.).

(6) Reinstall the center bezel onto the instrument panel. Refer to Instrument Panel Center Bezel in Group 8E - Instrument Panel Systems for the procedures.

(7) Connect the battery negative cable.

HEATER-A/C HOUSING

The heater-A/C housing assembly must be removed from the vehicle and the two halves of the housing separated for service access of the heater core, evaporator coil, blend-air door, and each of the various mode control doors.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. Refer to Instrument Panel Assembly in Group 8E - Instrument Panel Systems for the procedures.

REMOVAL AND INSTALLATION (Continued)

(3) If the vehicle is not equipped with air conditioning, go to Step 6. If the vehicle is equipped with air conditioning, recover the refrigerant from the refrigerant system. See Refrigerant Recovery in this group for the procedures.

(4) Disconnect the liquid line refrigerant line fitting from the evaporator inlet tube. See Refrigerant Line Coupler in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Disconnect the accumulator inlet tube refrigerant line fitting from the evaporator outlet tube. See Refrigerant Line Coupler in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Drain the engine cooling system. Refer to Group 7 - Cooling System for the procedures.

(7) Disconnect the heater hoses from the heater core tubes. Refer to Group 7 - Cooling System for the procedures. Install plugs in, or tape over the opened heater core tubes.

(8) Unplug the heater-A/C system vacuum supply line connector from the tee fitting near the heater core tubes.

(9) Unplug the heater-A/C unit wire harness connector, which is fastened to the heater-A/C housing next to the blower motor relay (Fig. 39).

Fig. 39 Heater-A/C Unit Connector

- 1 - BLOWER MOTOR RELAY
- 2 - VACUUM HARNESS
- 3 - HEATER-A/C WIRE HARNESS CONNECTOR
- 4 - HEATER-A/C HOUSING

(10) Remove the five nuts from the heater-A/C housing mounting studs on the engine compartment side of the dash panel (Fig. 40). Remove or reposition the evaporation canister for additional access, if required.

80abd234

Fig. 40 Heater-A/C Housing Remove/Install

- 1 - HEATER-A/C HOUSING
- 2 - STUD
- 3 - NUT
- 4 - STUD
- 5 - RIGHT FRONT FENDER

(11) Pull the heater-A/C housing rearward far enough for the mounting studs and the evaporator condensate drain tube to clear the dash panel holes.

(12) Remove the heater-A/C housing from the vehicle.

DISASSEMBLY

(1) Remove the heater-A/C housing from the vehicle and place it on a work bench.

(2) Unplug the vacuum harness connectors from the floor door actuator and, if the unit is so equipped, the recirculation air door actuator.

(3) Disengage the vacuum harness from any routing clips located on the lower half of the heater-A/C housing.

(4) Disengage the heater-A/C wire harness connector and the blower motor relay wire harness connector push-in retainers from their mounting holes on the heater-A/C housing.

(5) Remove the blower motor and blower wheel unit from the heater-A/C housing. See Blower Motor in this group for the procedures.

(6) Carefully remove the foam seal from the flange around the blower motor opening in the heater-A/C housing. If the seal is deformed or damaged, it must be replaced.

(7) Pull the vacuum supply line and connector through the foam seal on the heater core and evaporator coil tube mounting flange of the heater-A/C housing (Fig. 41).

(8) If the unit is equipped with air conditioning, remove the screw that secures the clamp to the evaporator coil tubes and remove the clamp.

REMOVAL AND INSTALLATION (Continued)

**Fig. 41 Heater-A/C Housing Disassembly**

- 1 - SEALS
- 2 - EVAPORATOR TUBE CLAMP
- 3 - CLIPS
- 4 - HEATER CORE TUBES
- 5 - VACUUM SUPPLY LINE
- 6 - BLOWER MOTOR

**Fig. 42 Heater-A/C Housing Assembly**

- 1 - BLOWER MOTOR VENTURI RING
- 2 - BLEND-AIR DOOR PIVOT
- 3 - EVAPORATOR COIL TUBE RUBBER SEAL
- 4 - RECIRCULATION AIR DOOR PIVOTS

(9) Carefully remove the foam seal from the heater core and evaporator coil tube mounting flange of the heater-A/C housing. If the seal is deformed or damaged, it must be replaced.

(10) Use a screwdriver to pry off the two snap clips that help secure the upper and lower heater-A/C housing halves to each other.

(11) Remove the 14 screws that secure the upper and lower heater-A/C housing halves to each other.

(12) Carefully separate the upper heater-A/C housing half from the lower half.

ASSEMBLY

(1) Assemble the upper heater-A/C housing half to the lower half. During assembly, be certain of the following:

(a) That each of the mode door pivot shaft ends is properly engaged in its pivot hole (Fig. 42).

(b) That the blower motor venturi ring is properly indexed and installed.

(c) If the unit is equipped with air conditioning, that the evaporator coil tube rubber seal is properly positioned in the grooves in both the upper and lower heater-A/C housing halves.

(2) Install the 14 screws and two snap clips that secure the upper and lower heater-A/C housing halves to each other. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Install the blower motor and wheel unit in the heater-A/C housing. See Blower Motor in this group for the procedures.

(4) Install the foam seals on the flanges around the blower motor opening and the heater core and evaporator coil tube mounting flange of the heater-A/C housing.

(5) Insert the vacuum supply line and connector through the foam seal on the heater core and evaporator coil tube mounting flange of the heater-A/C housing.

(6) If the unit is equipped with air conditioning, reinstall the evaporator coil tube clamp. Tighten the mounting screw to 2.2 N·m (20 in. lbs.).

(7) Engage the heater-A/C wire harness connector and blower motor relay wire harness connector push-in retainers with their mounting holes in the heater-A/C housing.

(8) Engage the vacuum harness to the routing clips and plug in the vacuum harness connector at the floor door actuator and, if the unit is so equipped, at the recirculation air door actuator.

(9) Install the heater-A/C housing in the vehicle.

INSTALLATION

(1) Position the heater-A/C housing to the dash panel. Be certain that the evaporator condensate drain tube and the housing mounting studs are inserted into their correct mounting holes.

(2) Install and tighten the five nuts onto the heater-A/C housing mounting studs on the engine compartment side of the dash panel. Tighten the nuts to 6.2 N·m (55 in. lbs.).

(3) If the evaporation canister was repositioned during the removal procedure, reinstall it to its proper position.

(4) Connect the heater-A/C system vacuum supply line connector to the tee fitting near the heater core tubes.

(5) Unplug or remove the tape from the heater core tubes. Connect the heater hoses to the heater

REMOVAL AND INSTALLATION (Continued)

core tubes and fill the engine cooling system. Refer to Group 7 - Cooling System for the procedures.

(6) If the vehicle is not equipped with air conditioning, go to Step 10. If the vehicle is equipped with air conditioning, unplug or remove the tape from the accumulator inlet tube and the evaporator outlet tube fittings. Connect the accumulator inlet tube coupler to the evaporator outlet tube. See Refrigerant Line Coupler in this group for the procedures.

(7) Unplug or remove the tape from the liquid line and the evaporator inlet tube fittings. Connect the liquid line coupler to the evaporator inlet tube. See Refrigerant Line Coupler in this group for the procedures.

(8) Evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

(9) Charge the refrigerant system. See Refrigerant System Charge in this group for the procedures.

(10) Install the instrument panel in the vehicle. Refer to Instrument Panel Assembly in Group 8E - Instrument Panel Systems for the procedures.

(11) Connect the battery negative cable.

(12) Start the engine and check for proper operation of the heating and air conditioning systems.

HEATER-A/C HOUSING DOOR

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

BLEND-AIR DOOR

(1) Remove and disassemble the heater-A/C housing. See Heater-A/C Housing in this group for the procedures.

(2) Lift the blend-air door pivot shaft out of the pivot hole in the bottom of the lower half of the heater-A/C housing (Fig. 43).

(3) Reverse the removal procedures to install.

PANEL/DEMIST DOOR AND LEVER

(1) Remove and disassemble the heater-A/C housing. See Heater-A/C Housing in this group for the procedures.

(2) Remove the defrost and panel/demist door vacuum actuators from the heater-A/C housing. See Mode Door Vacuum Actuator in this group for the procedures.

Fig. 43 Blend-Air Door

- 1 - BLEND-AIR DOOR
- 2 - EVAPORATOR COIL
- 3 - PIVOT HOLE
- 4 - HEATER CORE

(3) Insert a screwdriver into the latch hole (Fig. 44) of the panel/demist door pivot shaft to release the latch of the panel/demist door lever, and pull the lever out of the pivot shaft from the outside of the upper half of the heater-A/C housing.

Fig. 44 Mode Door Lever Remove/Install - Typical

- 1 - DOOR PIVOT SHAFT
- 2 - LATCH HOLE
- 3 - CRANK ARM LATCH
- 4 - FLAT BLADE PRY TOOL

(4) Reach inside the upper half of the heater-A/C housing and carefully flex the panel/defrost door (Fig. 45) enough so that the door pivot clears the pivot hole in the housing.

(5) Remove the panel/demist door from the heater-A/C housing.

(6) Reverse the removal procedures to install.

REMOVAL AND INSTALLATION (Continued)

**Fig. 45 Panel/Demist and Defrost Doors**

- 1 - PANEL/DEMIST DOOR
- 2 - UPPER HEATER-A/C HOUSING
- 3 - DEFROST DOOR

DEFROST DOOR AND LEVER

(1) Remove and disassemble the heater-A/C housing. See Heater-A/C Housing in this group for the procedures.

(2) Remove the panel/demist door and lever from the upper heater-A/C housing. See Panel/Demist Door and Lever in this group for the procedures.

(3) Insert a screwdriver into the latch hole (Fig. 44) of the defrost door pivot shaft to release the latch of the defrost door lever, and pull the lever out of the pivot shaft from the outside of the upper half of the heater-A/C housing.

(4) Reach inside the upper half of the heater-A/C housing and carefully flex the defrost door (Fig. 45) enough so that the door pivot clears the pivot hole in the housing.

(5) Remove the defrost door from the heater-A/C housing.

(6) Reverse the removal procedures to install.

FLOOR DOOR AND LEVER

(1) Remove and disassemble the heater-A/C housing. See Heater-A/C Housing in this group for the procedures.

(2) Remove the floor door vacuum actuator from the lower heater-A/C housing. See Mode Door Vacuum Actuator in this group for the procedures.

(3) Insert a screwdriver into the latch hole (Fig. 44) of the floor door pivot shaft to release the latch of the floor door lever, and pull the lever out of the pivot shaft from the outside of the lower half of the heater-A/C housing.

(4) Reach inside the lower half of the heater-A/C housing and carefully flex the floor door (Fig. 46)

enough so that the door pivot clears the pivot hole in the housing.

**Fig. 46 Floor Door**

- 1 - LOWER HEATER-A/C HOUSING
- 2 - PIVOT SHAFT
- 3 - CRANK ARM
- 4 - FLOOR DOOR

(5) Remove the floor door from the heater-A/C housing.

(6) Reverse the removal procedures to install.

RECIRCULATION AIR DOOR

A recirculation air door and vacuum actuator are used only on models with the optional air conditioning system.

(1) Remove and disassemble the heater-A/C housing. See Heater-A/C Housing in this group for the procedures.

(2) Remove the recirculation air door vacuum actuator from the lower heater-A/C housing. See Mode Door Vacuum Actuator in this group for the procedures.

(3) Reach inside the lower half of the heater-A/C housing and lift the bottom edge of the recirculation air door upwards (Fig. 47).

(4) Guide the recirculation air door lever through the air intake grille of the heater-A/C housing while removing the door from the housing.

(5) Reverse the removal procedures to install.

REMOVAL AND INSTALLATION (Continued)

**Fig. 47 Recirculation Air Door**

- 1 - RECIRCULATION AIR DOOR
- 2 - LOWER HEATER-A/C HOUSING
- 3 - LEVER
- 4 - PIVOT SHAFT

**Fig. 48 Heater Core Remove/Install**

- 1 - HEATER CORE
- 2 - LOWER HEATER-A/C HOUSING

HEATER CORE

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Remove and disassemble the heater-A/C housing. See Heater-A/C Housing in this group for the procedures.

(2) Lift the heater core out of the lower half of the heater-A/C housing (Fig. 48).

(3) Reverse the removal procedures to install. Be certain that the heater core foam insulator is reinstalled.

LIQUID LINE

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure

that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in this group for the procedures.

(3) Disconnect the liquid line refrigerant line couplers at the evaporator inlet and the condenser outlet (Fig. 49). See Refrigerant Line Coupler in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(4) Remove the liquid line from the vehicle.

INSTALLATION

(1) Remove the tape or plugs from the refrigerant line fittings on the liquid line, the evaporator inlet and the condenser outlet. Connect the liquid line to the evaporator inlet and condenser outlet refrigerant line couplers. See Refrigerant Line Coupler in this group for the procedures.

(2) Connect the battery negative cable.

REMOVAL AND INSTALLATION (Continued)

**Fig. 49 Liquid Line Remove/Install**

- 1 - LIQUID LINE WITH ORIFICE TUBE
- 2 - CLIP
- 3 - CONDENSER
- 4 - OUTLET TUBE
- 5 - STUD
- 6 - CLIP
- 7 - CLIP
- 8 - EVAPORATOR INLET

(3) Evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

(4) Charge the refrigerant system. See Refrigerant System Charge in this group for the procedures.

LOW PRESSURE CYCLING CLUTCH SWITCH**REMOVAL**

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the low pressure cycling clutch switch on the top of the accumulator (Fig. 50).

(3) Unscrew the low pressure cycling clutch switch from the fitting on the top of the accumulator.

(4) Remove the O-ring seal from the accumulator fitting and discard.

INSTALLATION

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the accumulator fitting. Use only the specified O-rings as they are made of a

80abd2a4

Fig. 50 Low Pressure Cycling Clutch Switch Remove/Install - Typical

- 1 - WIRE HARNESS CONNECTOR
- 2 - ACCUMULATOR
- 3 - LOW PRESSURE CYCLING CLUTCH SWITCH

special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(2) Install and tighten the low pressure cycling clutch switch on the accumulator fitting. The switch should be hand-tightened onto the accumulator fitting.

(3) Plug the wire harness connector into the low pressure cycling clutch switch.

(4) Connect the battery negative cable.

KICK COVER

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Loosen the two screws that secure the upper half of the kick cover to the heater-A/C housing

REMOVAL AND INSTALLATION (Continued)

under the passenger side end of the instrument panel (Fig. 51).

Fig. 51 Kick Cover Remove/Install

- 1 – HEATER-A/C HOUSING
- 2 – MOUNTING SCREWS
- 3 – KICK COVER

(3) Remove the two screws that secure the lower half of the kick cover to the heater-A/C housing.

(4) Pull the kick cover down towards the floor panel to disengage the slotted upper mounting tabs from under the two loosened heater-A/C housing screws.

(5) Remove the kick cover from the heater-A/C housing.

INSTALLATION

(1) Position the slotted upper kick cover mounting tabs under the heads of the two loosened heater-A/C housing screws. Tighten the screws to 2.2 N·m (20 in. lbs.).

(2) Install the two screws that secure the lower kick cover to the heater-A/C housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

(3) Connect the battery negative cable.

MODE DOOR VACUUM ACTUATOR

WARNING: ON VEHICLES EQUIPPED WITH AIR-BAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIR-BAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

DEFROST DOOR ACTUATOR

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel assembly from the vehicle. Refer to Instrument Panel Assembly in Group 8E - Instrument Panel Systems for the procedures.

(3) Unplug the two vacuum harness connectors from the defrost door actuator (Fig. 52).

Fig. 52 Defrost, Floor, and Panel/Demist Door Vacuum Actuators

- 1 – PANEL/DEMIST DOOR ACTUATOR
- 2 – DEFROST DOOR ACTUATOR
- 3 – FLOOR DOOR ACTUATOR

(4) Insert a trim stick or another suitable wide flat-bladed tool into the latch hole on the heater-A/C housing actuator mount (Fig. 53). Gently pry the actuator latch while pulling firmly outwards on the actuator to remove the actuator from the mount.

(5) Rotate and tilt the vacuum actuator as required to disengage the hole on the end of the actuator link from the hooked pin on the end of the defrost door lever.

(6) Remove the defrost door vacuum actuator from the vehicle.

(7) Reverse the removal procedures to install.

FLOOR DOOR ACTUATOR

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel assembly from the vehicle. Refer to Instrument Panel Assembly in

REMOVAL AND INSTALLATION (Continued)

Fig. 53 Vacuum Actuator Remove/Install - Typical

- 1 - ACTUATOR MOUNT LATCH HOLE
2 - TRIM STICK
3 - ACTUATOR LATCH

Group 8E - Instrument Panel Systems for the procedures.

(3) Unplug the vacuum harness connector from the floor door actuator (Fig. 52).

(4) Insert a trim stick or another suitable wide flat-bladed tool into the latch hole on the heater-A/C housing actuator mount (Fig. 53). Gently pry the actuator latch while pulling firmly outwards on the actuator to remove the actuator from the mount.

(5) Rotate and tilt the vacuum actuator as required to disengage the hole on the end of the actuator link from the hooked pin on the end of the floor door lever.

(6) Remove the floor door vacuum actuator from the vehicle.

(7) Reverse the removal procedures to install.

PANEL/DEMIST DOOR ACTUATOR

(1) Remove the defrost door actuator from the heater-A/C housing. See Defrost Door Actuator in this group for the procedures.

(2) Unplug the vacuum harness connector from the panel/demist door actuator (Fig. 52).

(3) Insert a trim stick or another suitable wide flat-bladed tool into the latch hole on the heater-A/C housing actuator mount (Fig. 53). Gently pry the actuator latch while pulling firmly outwards on the actuator to remove the actuator from the mount.

(4) Rotate and tilt the vacuum actuator as required to disengage the hole on the end of the actuator link from the hooked pin on the end of the panel/demist door lever.

(5) Remove the panel/demist door vacuum actuator from the vehicle.

(6) Reverse the removal procedures to install.

RECIRCULATION AIR DOOR ACTUATOR

A recirculation air door and vacuum actuator are used only on models with the optional air conditioning system.

(1) Disconnect and isolate the battery negative cable.

(2) Remove the kick cover from the heater-A/C housing. See Kick Cover in this group for the procedures.

(3) Unplug the vacuum harness connector from the recirculation air door actuator (Fig. 54).

80abd286

Fig. 54 Recirculation Air Door Vacuum Actuator Remove/Install

- 1 - HOOK
2 - LEVER
3 - RECIRCULATION AIR DOOR ACTUATOR
4 - BLOWER MOTOR RESISTOR

(4) Insert a trim stick or another suitable wide flat-bladed tool into the latch hole on the heater-A/C housing actuator mount (Fig. 53). Gently pry the actuator latch while pulling firmly outwards on the actuator to remove the actuator from the mount.

(5) Rotate and tilt the vacuum actuator as required to disengage the hole on the end of the

REMOVAL AND INSTALLATION (Continued)

actuator link from the hooked pin on the end of the recirculation air door lever.

(6) Remove the recirculation air door vacuum actuator from the vehicle.

(7) Reverse the removal procedures to install.

REFRIGERANT LINE COUPLER

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in the Service Procedures section of this group.

(2) Remove the secondary clip from the spring-lock coupler.

(3) Fit the proper size A/C line disconnect tool (Special Tool Kit 7193) over the spring-lock coupler cage (Fig. 55).

Fig. 55 Refrigerant Line Spring-Lock Coupler Disconnect

(4) Close the two halves of the A/C line disconnect tool around the spring-lock coupler.

(5) Push the A/C line disconnect tool into the open side of the coupler cage to expand the garter spring. Once the garter spring is expanded and while still pushing the disconnect tool into the open side of the coupler cage, pull on the refrigerant line attached to the female half of the coupler fitting until the flange on the female fitting is separated from the garter

spring and cage on the male fitting within the disconnect tool.

NOTE: The garter spring may not release if the A/C line disconnect tool is cocked while pushing it into the coupler cage opening.

(6) Open and remove the A/C line disconnect tool from the disconnected spring-lock coupler.

(7) Complete the separation of the two halves of the coupler fitting.

INSTALLATION

(1) Check to ensure that the garter spring is located within the cage of the male coupler fitting, and that the garter spring is not damaged.

(a) If the garter spring is missing, install a new spring by pushing it into the coupler cage opening.

(b) If the garter spring is damaged, remove it from the coupler cage with a small wire hook (DO NOT use a screwdriver) and install a new garter spring.

(2) Clean any dirt or foreign material from both halves of the coupler fitting.

(3) Install new O-rings on the male half of the coupler fitting.

CAUTION: Use only the specified O-rings as they are made of a special material for the R-134a system. The use of any other O-rings may allow the connection to leak intermittently during vehicle operation.

(4) Lubricate the male fitting and O-rings, and the inside of the female fitting with clean R-134a refrigerant oil. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(5) Fit the female half of the coupler fitting over the male half of the fitting.

(6) Push together firmly on the two halves of the coupler fitting until the garter spring in the cage on the male half of the fitting snaps over the flanged end on the female half of the fitting.

(7) Ensure that the spring-lock coupler is fully engaged by trying to separate the two coupler halves. This is done by pulling the refrigerant lines on either side of the coupler away from each other.

(8) Reinstall the secondary clip over the spring-lock coupler cage.

SUCTION AND DISCHARGE LINE

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose.

REMOVAL AND INSTALLATION (Continued)

In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in this group for the procedures.

(3) Unplug the wire harness connector from the high pressure cut-off switch.

(4) Disconnect the discharge line refrigerant line fitting from the condenser inlet tube (Fig. 56). See Refrigerant Line Coupler in this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Remove the nut that secures the suction line block fitting to the accumulator outlet. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Remove the screw that secures the suction and discharge line manifold to the compressor. Install plugs in, or tape over all of the opened refrigerant line fittings.

(7) Remove the suction and discharge line assembly from the vehicle.

INSTALLATION

(1) Remove the tape or plugs from the suction and discharge line manifold and the compressor. Install the suction and discharge line manifold to the compressor. Tighten the mounting screw to 28 N·m (250 in. lbs.).

(2) Remove the tape or plugs from the suction line and the accumulator outlet block fittings. Install the suction line to the accumulator outlet and tighten the mounting nut to 9 N·m (80 in. lbs.).

(3) Remove the tape or plugs from the refrigerant line fittings on the discharge line and the condenser inlet tube. Connect the discharge line refrigerant line coupler to the condenser inlet tube. See Refrigerant Line Coupler in this group for the procedures.

- 2 - SCREW
- 3 - COMPRESSOR
- 4 - CONDENSER
- 5 - INLET
- 6 - CLIP
- 7 - HEX NUT
- 8 - ACCUMULATOR

(4) Plug in the wire harness connector to the high pressure cut-off switch.

(5) Connect the battery negative cable.

(6) Evacuate the refrigerant system. See Refrigerant System Evacuate in this group for the procedures.

(7) Charge the refrigerant system. See Refrigerant System Charge in this group for the procedures.

VACUUM CHECK VALVE

(1) Unplug the heater-A/C vacuum supply line connector at the vacuum check valve (Fig. 57).

(2) Note the orientation of the check valve in the vacuum supply line for correct reinstallation.

(3) Unplug the vacuum check valve from the vacuum supply line fittings.

(4) Reverse the removal procedures to install.

REMOVAL AND INSTALLATION (Continued)

- 6 - VACUUM SUPPLY LINE

VACUUM RESERVOIR

(1) Remove the passenger side bumper end cap from the front bumper. Refer to Group 23 - Body for the procedures.

(2) Unplug the vacuum supply line connector from the vacuum reservoir (Fig. 58).

80aac282

Fig. 58 Vacuum Reservoir Remove/Install

- 1 - VACUUM LINE
- 2 - RESERVOIR SCREWS
- 3 - VACUUM RESERVOIR

(3) Remove the two screws that secure the vacuum reservoir to the front bumper.

(4) Remove the vacuum reservoir from behind the front bumper.

(5) Reverse the removal procedures to install. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

SPECIFICATIONS**A/C APPLICATION TABLE**

Item	Description	Notes
Vehicle	XJ Cherokee/ Laredo	
System	R134a w/orifice tube	
Compressor	Sanden SD7H15	SP-20 PAG oil
Freeze-up Control	Low Pressure cycling cutout switch	accumulator mounted
Low psi Control	opens < 25 psi - resets > 43 psi	
High psi Control	switch - opens > 450-490 psi - resets < 270-330 psi	discharge line
Control Head	manual type	
Mode Door	vacuum	
Blend-Air Door	electric	
Fresh/Recirc door	vacuum	
Blower Motor	hardwired to control head	resistor block
Cooling Fan	viscous for cooling, single speed electric for A/C	
Clutch		
Control	relay	PCM
Draw	2 - 3.7 amps @ 12V	± 0.5V @ 70° F
Gap	0.016" - 0.031"	
DRB III®		
Reads	TPS, RPM, A/C switch test	
Actuators	clutch and fan relay
